Machiavelli's work. By separating politics and religion, he removed the mystical elements associated with true absolutist theory.

The people of France did not debate the existence of the monarchy itself. Rather, the Wars of Religion produced works by Catholics, Protestants, and moderates who attempted to impose constitutional limitations on the monarch, largely for personal gain. Jean Bodin was a leading member of the *politiques*, the conservative group that sought to preserve the state above all else. His *Six Books of the Republic* (1576) stated that sovereignty ought to be indivisible and that authority must be completely and unconditionally invested in a single individual. Cardinal Richelieu's *Political Testament* (1688) voiced similar ideas about the need for an absolute monarchy in the French kingdom.

In England, Thomas Hobbes was one of the most prominent supporters of absolute authority. His most famous work, *Leviathan* (1651), held that man needed a strong government to curb his corrupt impulses. Hobbes advised the ruler to heed the natural laws in order to keep the peace. His dismal view of humanity and his justification for absolutism are often contrasted with John Locke, who was an advocate for an ultimate legislative authority. Yet England during the sixteenth century was a mixed monarchy. Power was shared between the Parliament and the sovereign monarch. In the Glorious Revolution of 1688, the Anglican representative body installed William of Orange and Mary as the sovereign monarchs of England. The Bill of Rights made Parliament a permanent part of the English government and reaffirmed its tradition of constitutionalism.

The seventeenth century was the Golden Age for the Netherlands. The Dutch Declaration of Independence (1581) was the first document of its kind in the early modern era. The absolute rulers of Spain had aggressively persecuted the Protestants of the Low Countries. After Charles V and Philip II rejected the early charters of freedom, the Dutch revolted and lawfully declared themselves a republic. Constitutional theories continued to spread throughout western Europe, but the *ancien régime* in France, England, and Spain clung to absolutism through the eighteenth century.

The formal gardens of Versailles, once the lavish palace of King Louis XIV. (Corel)

Spain was a traditional absolutist monarchy and remained as such throughout the early modern era. During the sixteenth century, Spain was considered to be more absolute than France and spent a considerable effort attempting to suppress the rise of Protestantism by trying to install Orthodox Catholic rulers. The defeat of the Armada in 1588 removed Spain as a maritime threat and opened the door for England and the Netherlands to dominate the seas. Portugal operated under the yoke of Spain for many years and was forced to participate in Spanish wars until the revolt of 1640. Absolutism was not fully realized in Portugal until the reign of John V during the early eighteenth century.

There is no more definitive example of true, divine right absolutism than Louis XIV. His greatest contribution as ruler was the unification and centralization of France, but his series of wars devastated the French people and the economy. Louis followed the guidance of Bishop Jacques Bossuet, who firmly stated that God invested the monarchs of France with divine authority. The Sun King moved the administrative center from the Louvre palace in Paris to Versailles, where he tamed the rebellious nobility and kept them fighting among themselves to prevent them from uniting against the Crown on their common grievances. Louis XIV installed brilliant and capable ministers to monitor and regulate the kingdom, but he was also personally involved in the administration of the kingdom. Under the absolute rule of Louis XIV, France reached new cultural heights and became a strong military and diplomatic force. The reign of the Sun King stood as a model for other monarchs of the seventeenth and eighteenth centuries.

➤ CHÂTEAU DE VERSAILLES

Formerly a hunting lodge in the small village of Versailles, Château de Versailles was transformed by Louis XIV and the most skilled architects and artists of the era into a splendid and sprawling Baroque palace. The Château de Versailles not only embodied absolutist materialism but was also used by the Sun King to centralize the French administration and effectively ended the noble uprisings that had plagued the French kingdom.

When it was complete, Versailles could hold up to 5,000 people. The grounds contained 1,400 fountains and 400 pieces of new sculpture. The roof of the chateau spanned 26 acres (10.5 hectares). The interior contained 67 staircases, 700 rooms, 2,153 windows, 5,000 items of furniture and objets d'art, and 6,000 paintings.

Louis XIV was determined to create a palace different in every conceivable manner from his place of childhood imprisonment, the Louvre. Only the finest and most accomplished craftsmen were allowed to shape the new face of the palace, including Louis Le Vau, André Le Notre, Charles Le Brun, and Jules Hardouin-Mansart. The Château de Versailles represented the pinnacle of French absolutism as the seat of the newly centralized French monarchy. It became the center of social and cultural life as well as a model for other European palaces.

Absolutism in Eastern Europe

The political concept of absolutism influenced the structure of government in early modern eastern Europe in the late seventeenth and early eighteenth centuries. While some of these regimes were not as regimented and centralized

Peter I, also known as Peter the Great, ruled the Russian empire from 1682 until his death in 1725. (Library of Congress)

as that crafted by Cardinal Richelieu, Cardinal Mazarin, and Louis XIV in France, they did share some similarities with the French absolutist state. The emergence of Brandenburg-Prussia and Habsburg Austria out of the ruins of the old Holy Roman Empire and the rise of Russia as a powerful contender in European affairs are examples of this surge in absolutist authority in their respective governing monarchies. In contrast, the inability of Poland, Sweden, and other eastern European states to assert themselves in this same capacity doomed them to the position of second-rate powers in the lands of eastern Europe.

Brandenburg-Prussia's entrance onto the stage of the great powers of Europe was a result of the initiatives of the Hohenzollern monarchy to create both a powerful military and a centralized bureaucracy to rule the scattered lands of the German kingdom. Prussian kings Frederick William I (1688–1740) and Frederick William II (1744–1797) were able to muster a sizable military force by centralizing the resources of the Prussian lands and the establishment of a large bureaucracy, thereby creating a strong absolutist

state. In this way, Brandenburg-Prussia was able to engage successfully against other larger European powers in the War of the Spanish Succession (1701–1714) and the War of the Austrian Succession (1740–1748). To quell the potential of aristocratic resentment against growing monarchical power, the Hohenzollerns incorporated them into the military officer corps and the high bureaucracy, making them accountable to the success of the state and the military.

Unlike Prussia, Habsburg Austria was a composite kingdom made up of various non-German national groups. Habsburg government centralization during the late seventeenth and early eighteenth centuries relied on playing one national group against the other while maintaining the supremacy of the Crown. Given the threats to Austria by Prussia, France, and the Ottoman empire, it was crucial for the Habsburgs to maintain large armies and garrisons on two fronts, thereby necessitating a centralized bureaucracy and an efficient system of taxation and raising of troops. Habsburg absolutism, particularly under Maria Theresa (1717–1780), continued to rely on the loyalty of mostly Austrian high officials in asserting the dominance of Habsburg authority over national affairs while allowing for some level of autonomy for the various national groups (particularly that of Hungary and Bohemia) in local affairs. Resistance to the Austrian Pragmatic Sanction by Prussia made Empress Maria Theresa aware of the need to placate the composite kingdoms by allowing for some level of autonomy.

Tsarist Russia under the rule of Peter I (1672–1725), also known as Peter the Great, emulated the absolutist regimes in the West to some extent. Tsar Peter sought to modernize Russia to the level of the rest of Europe by promoting armament works, manufacturing, and shipping industries. Much like the Hohenzollern Prussian monarchs, he leveled the power of the aristocracy, incorporating them into the machinery of the state and the military, and effectively created a centralized bureaucracy to expand the personal power of the tsar. He expanded the capacity of the Russian military and was able to confront both the Swedes and the Turks successfully in various encounters, thereby attaining territories at their expense. Catherine II

► REBELS AND REVOLUTIONARIES—RAKOCZI AND MAZEPPA

Amid the centralizing authority of the absolutist regimes in eastern Europe, certain leaders emerged to resist the encroachments of the centralizing monarchy at the expense of their respective national groups within these larger composite kingdoms. Hungarian Francis Rakoczi (1676–1735) and Ukrainian Ivan Mazeppa (1639–1709) led armed resistance against their respective imperial overlords (Habsburg Austria and tsarist Russia). Rakoczi sought foreign assistance from France and Turkey against the Austrian Habsburgs on multiple occasions, refusing to acknowledge the supremacy of the Habsburg Crown in Hungary. When Austrian occupation troops were removed to fight in the War of the Spanish Succession (1701–1714) in the West, Rakoczi took full advantage to attack positions in the rear. Ultimately Rakoczi's

forces were defeated, and he lived in exile in the Ottoman empire along with his loyal entourage. Mazeppa, having worked as a Cossack officer within the Russian military in the past, chose to defend his homeland when Russian troops attacked his fellow Ukrainians in acts of retribution for treason against the tsar. Like Rakoczi, Mazeppa rallied his fellow Ukrainians against the encroaching power of the absolutist monarchy and fought against overwhelming odds for autonomy from the Russian state. He actively sought an alliance with the Swedes during the Great Northern War (1700–1721) but, like Rakoczi, was ultimately defeated at the Battle of Poltava (1709). Both men died in exile, revered as heroes by their respective peoples.

—Abraham O. Mendoza

(also known as Catherine the Great) continued the expansion of the tsarist state, extending it at the expense of Poland and the Ottoman empire. While she was an avid patron of the arts and an Enlightened despot, even exchanging correspondence with Voltaire, she was also responsible for repressive measures against rebels and maintaining serfdom.

In contrast to Brandenburg-Prussia, Habsburg Austria, and tsarist Russia, Sweden and Poland were powers on the wane that did not adopt absolutist governments but instead grew increasingly vulnerable to foreign aggression. Sweden, a small kingdom that had been successful in engaging larger powers with its highly efficient professional army, was eventually crushed by Prussian and Russian forces. After nearly a half century of the Baltic being a Swedish lake, Sweden's power was permanently removed from the region by the territorial ambitions of Brandenburg-Prussia and tsarist Russia. Poland, subject to the waning power of the monarch and the growing power of a contentious aristocracy, became more vulnerable to the encroachments of its more powerful neighbors. The titular and impotent nature of the Polish monarchy, which was subject to election by the aristocracy, and the *liberum veto* (in which any deputy in the Polish Diet could put an end to the current legislative session and nullify

all legislation passed) further contributed to the weakness of the Polish state. Eventually the partitions of Poland (1772, 1793, and 1795) by Prussia, Austria, and Russia would end its sovereignty, which was not restored until 1919.

Pirates and Privateers

Although frequently used interchangeably, the terms “piracy” and “privateering” represent two distinct applications of violence at sea, with piracy involving illegal activities including theft, kidnap, and sometimes murder and privateering being sanctioned in law. The origins of privateering are twofold. In medieval Europe, state navies were a rarity, and sovereigns requisitioned privately owned ships to augment their forces in time of war. Because piracy was commonplace and most merchant ships and their crews were armed, this was a sensible measure. The practice of licensing these auxiliaries began in the

► PIRACY AND CROWN SPONSORSHIP

However clear-cut the distinction between piracy and privateering may have been, sovereigns could blur the lines between them by authorizing their subjects to operate covertly against their enemies. Such was the case when Queen Elizabeth approved a mission by Francis Drake to reconnoiter the Pacific coast of Spanish America and plunder Spanish shipping in 1577. England and Spain were not at war, but so far as the Spanish were concerned the Strait of Magellan and the Pacific coast of South America were Spanish territory to which foreigners could not sail without authorization, which Drake neither sought nor desired. Elizabeth could have issued a letter of marque, but had she done so and the fact become public, she risked war with Philip. At the same time, Drake was not a common criminal or pirate seizing property indiscriminately, nor was he sailing in flagrant disregard of Elizabeth's wishes or interests. Even before Drake's return, news of his exploits had inflamed Spanish opinion, elicited a variety of reactions in England, and forced Elizabeth to keep Drake at arm's length. Portuguese protests forced one of Drake's captains, John Winter, to surrender his share of the spoils taken from a Portuguese pilot, goods that the lord admiral (who happened to be one of Drake's chief investors) said were taken by Francis Drake and his accomplices "piratically." For good measure, Winter was imprisoned for piracy and was only released upon Drake's return. Elizabeth's eventual embrace of Drake was due largely to the phenomenal success of the voyage, which netted the Crown £264,000, about half the government's annual revenues for a year.

—Lincoln P. Paine

thirteenth century, when merchant ships were commissioned to seize enemy shipping with the stipulation that half the value of their prize be shared with the king. Properly administered, this could prove a lucrative source of revenue, but privateers often overstepped their bounds and acted much like pirates.

Piracy flourishes in a variety of conditions. China's Ming dynasty banned private sea trade from 1374 to 1567 and regarded anyone violating the ban as pirates. Denied opportunities for legitimate commerce, many Chinese merchants

engaged in illicit trade, and by the sixteenth century a large number of them were operating out of Japanese ports. Although most of these smugglers were Chinese, the authorities called them *wokou* ("Japanese pirates"). Their activities became particularly bad from the 1520s, when the government suspended trade with Japan following a riot between rival Japanese merchants at Ningbo. China's demand for silver and Japan's appetite for silk, coupled with the lack of profitable employment among Chinese traders, led to an increase in smuggling and piracy on the coast between Jiangsu and Fujian. Their activities peaked in 1552, when Xu Hai raided Jiangsu and Zhejiang with a force of some 20,000 men. Five years later the government legalized overseas trade (except with Japan), which diminished the allure of piracy.

Between 1570 and 1670, Cossack piracy flourished on the Black and Caspian seas and their tributaries, which constituted a lawless frontier zone between Russian Muscovy, the Polish-Lithuanian Commonwealth, the Ottoman empire, and Safavid Persia. Though occasionally recruited by the Christian powers to attack Muslim fleets, they never had the status of privateers, and their conduct was not determined by religious scruples. The last and most notorious of the Cossack pirates was Stepan Razin, who in 1667 seized a wealthy Russian convoy on the Volga, attacked a Persian ship bearing gifts for the tsar, and raided Astrakhan before embarking on a nearly two-year expedition on the Caspian. Razin's actions compelled the Russians to station a ship at Astrakhan in 1670, and the following year he was captured and executed.

Piracy could also result from more personal misfortune, as was the case of a sixteenth-century Dutch merchant whose insurers refused to pay for the loss of his ship and who began operations in the Baltic. His operations received the cover of legitimacy when the Duke of Mecklenburg licensed him as a privateer to operate against his insurers or their interests. Piracy in Europe grew rapidly thanks especially to hostilities surrounding the Eighty Years' War for Dutch independence. Habsburg officials encouraged freebooters from Dunkirk and Ostend to sail against the Dutch merchant and fishing fleets as far afield as the Shetland Islands and Iceland.

By midcentury, the ports of England, the Dutch Republic, the Spanish Netherlands, France, and Spain were thick with corsairs and privateers. These were most active during the incessant naval wars between 1652 and 1697, when the English seized between 3,600 and 4,300 enemy merchantmen and lost between 5,500 and 6,300 ships to the Dutch, French, and others.

European pirates followed European trade overseas especially to the Caribbean, where the Dutch, English, and French sought to wrest control of the islands from the Spanish. After the British took Jamaica from Spain in 1670, Port Royal became the fastest-growing English settlement in the Americas and the undisputed center of English piracy in the Caribbean until a massive earthquake destroyed the city in 1692. Even before this, however, government efforts to reign in piracy and privateering had forced west Indian buccaneers to turn to the low-lying fruit of the Indian Ocean, where indigenous and foreign piracy was a long-standing problem. In 1632 the Mughal Shah Jahan expelled the Portuguese from Hughli because so many Portuguese had turned pirate in the Bay of Bengal. In 1686 English pirates plundered Surat shipping in the Red Sea, which led to Mughal reprisals against the English. The East India Company retaliated against Mughal maritime interests from Gujarat to Bengal and blockaded Basra and Mocha before the two sides came to terms in 1690. A more long-standing problem was that of Omani piracy, which had grown out of Oman's challenge to the Portuguese in East Africa and India. As the Omanis' theater of operations expanded, the imams' control over their activities diminished, and until the end of the century the Omanis were infamous for their depredation of European, Persian, Indian, and Arab shipping.

The assertion of European state control over warfare at sea, a decline in privateering, and efforts to eliminate piracy led to increased efficiencies in shipping. Extra hands to man the guns were no longer needed, which increased the tonnage-to-crew ratio, a standard measure of economic efficiency. Fewer guns also left more space available for paying cargo; Jamaica ships carried one gun per 18 tons in 1730 and one gun per 162 tons 40 years later; for Virginia vessels, the ratio rose from one gun per 29 tons to less

than one gun per 1,000 tons. The decline in violence against ships was also reflected in falling insurance rates.

Runaway Slaves in Colonial Virginia

From the onset of slavery in colonial America, African slaves resisted what commonly was known in the United States as the "peculiar institution" by running away. As runaways, they simultaneously removed a source of labor and threatened the master's dominance. Because of this twofold frustration, Virginia slave owners enlisted many means, legal and otherwise, to regain fugitive slaves.

Historians such as Edmund Morgan have noted the paradox that both African slavery and American ideas of political liberty emerged side by side in colonial Virginia. After Virginia was established as a British colony, small-scale slavery soon emerged. Records indicate that as early as 1619 a Dutch ship deposited 20 African slaves in Jamestown. For the first few decades Africans and white indentured servants often worked side by side. In 1661 of Virginia's population of 25,600 colonists, 6,000 were white servants and 2,000 were African. But by the 1670s planters grew more and more reliant on an enslaved

➤ ADVERTISING FOR RUNAWAYS

In the eighteenth century, Virginia planters utilized newspapers as a key means of locating runaway slaves and indentured servants. Between 1736 and 1780, 961 fugitive ads appeared in the *Virginia Gazette*. A typical advertisement included information about a runaway's sex, age, color, and skills as well as information about where he or she might be hiding and any distinguishing marks (many from punishment for previous flights). Other ads provided information about supposed runaways who had been captured, providing similar information.

One such advertisement ran in the *Virginia Gazette* in August 1766:

“RUN away from the subscriber in Prince Edward county, some time in March last, a Virginia born Negro fellow named SAMPSON, near 6 feet [1.8 meters] high, has small legs, two of his fore fingers (I believe on his right hand) were burned when he was small, and are now much crooked; had on when he went away an old German serge coat, fine linen shirt, and osnabrug trousers. Whoever

brings the said Negro to me shall have two pistoles reward, beside what the law allows.

—RICHARD WOODSON.
—(*Virginia Gazette* (Williamsburg),
August 22, 1766.)”

As was typical, this ad identified the runaway's physical features for easier identification and offered a reward for his return.

Of the 961 ads in the *Virginia Gazette* between 1736 and 1780, only 84 involved female runaways, and the typical ages given were between ages 17 and 30. Using ads like these, historians have been able to establish some patterns about who typical runaways were: young males.

—Bonnie Laughlin-Schultz

Source

Virginia Runaways: Runaway Slave Advertisements from 18th-century Virginia Newspapers, ed. Thomas Costa, <http://etext.lib.virginia.edu/etcbin/costa-browse?id=r66080192>.

African workforce. Laws discouraged manumission, limited the rights of free blacks, and established that children of slave women would be enslaved for life. By the eve of the American Revolution, slaves were two-fifths of the population of Virginia and were particularly numerous in the tobacco-growing Chesapeake region.

In addition to other subtle forms of resistance such as feigned illness, work slowdowns, or breaking objects, Virginia slaves (as well as some white indentured servants) resorted to a more radical form of resistance: running away. Scholars have found that while there was no typical runaway, demographic patterns among runaways are apparent. Most who ran did so individually or in small groups. The larger groups that Harriet Tubman later accompanied in the nineteenth century were uncommon in colonial Virginia because the larger the party, the greater the danger of discovery. Most runaways were young male field slaves in their teens or twenties. Several issues served as typical triggers for escape: the uncertainty that surrounded the death of an owner, threat of the sale of family

or oneself, or violent abuse. Runaways in colonial Virginia took refuge in the woods with relatives, Native American tribes, Quakers, or other sympathetic people or in cities such as Williamsburg, Norfolk, and Richmond, where they hoped to pass as free African Americans. One famous maroon settlement (an integrated community of African and Native Americans) flourished in the Great Dismal Swamp of southern Virginia. As northern states gradually abolished slavery following the American Revolution, runaways sought freedom north of the Mason-Dixon Line.

Slave owners employed many methods to recapture a runaway. Sensing that runaway slaves were an especially “troublesome property,” the Virginia legislature, beginning in the late seventeenth century, tightened restrictions on free African Americans and fines for those helping runaways. A national fugitive slave clause was later instituted in the Constitution; by this time, Virginia was home to close to 300,000 slaves. In addition to these legal measures, planters turned to other resources to regain their slaves.

In colonial times, slave patrols were called up throughout the southern states. Numbering from a handful to a dozen people, patrols were organized in military fashion with the legal authority to search almost anywhere for runaway slaves. Planters also employed slave catchers and dogs in the hunt, and rewards were offered for information or the return of runaways. Once newspapers emerged as a prominent medium of communication in the eighteenth century, planters posted advertisements for runaways (both slaves and servants).

The diaries of prominent planters like William Byrd and Landon Carter demonstrate that a range of violent punishment was meted out to any slaves who were recaptured to discourage others from running away. Whippings, bodily mutilation, and other punishments were used to quell all resistance, and runaways drew some of the worst physical abuse. Virginia legislative statutes of 1723 and 1746 even allowed for dismemberment of repeat offenders. Whenever rumors of larger slave revolts abounded, such as in the 1730s when rumors reported impending slave uprisings in Queen Anne and Norfolk counties, planters clamped down on African Americans, both enslaved and free, and on any runaways. In the upheaval of the American Revolution, when prominent Virginians such as Landon Carter, George Washington, and Thomas Jefferson lost dozens of slaves to flight, Virginia slave owners and legislators tightened laws to prevent and deal with fugitive slaves. With this as well as the development of the northern United States as a place for runaways to find freedom, the Haitian Slave Revolt (which began in 1791), and the Gabriel's Rebellion (1800) in Virginia in mind, during the late eighteenth and early nineteenth centuries every southern state passed laws about runaways, defining who they were, how they were to be apprehended, and what was to happen after capture.

Centralizing Forces in Polynesia before Contact

The term “Polynesia” refers to a region including the islands in the triangle outlined by New Zealand in the southwest, Hawaii in the north, and Rapa Nui or Easter Island in the southeast along with the outliers of Tonga and Samoa. In the second millennium CE societies in this region developed into what is generally known as chiefdoms in historical, anthropological, and archaeological literature. The development of these chiefdoms occurred within a broad Polynesian pattern while resulting in a remarkable array of cultural forms on different islands and island groups. By the end of the fifteenth century Polynesian people had colonized most of the major landmasses in the region, including the remote archipelagoes of Hawaii and New Zealand. Colonization of the islands and island groups of Polynesia was typically followed by population growth, agricultural intensification, and the development of complex religious and political institutions.

Polynesian populations often went through cycles of intense growth, eventually reaching a state of equilibrium as fertility rates decreased because of resource stress or increased emphasis on surplus production and trade. The production of agricultural surplus typically focused on starchy tubers such as taro and sweet potato. Polynesian people invested large amounts of time in developing agricultural field systems with irrigation ditches, boundary walls to protect crops from wind and animals, and mounds of various kinds to raise tubers. Agricultural

► COLLAPSE? HISTORICAL DEVELOPMENTS ON RAPA NUI

The landscape of Rapa Nui, also called Easter Island, with its famous stone heads, is a synthesis of natural setting and human agency created over centuries. Intensive agriculture and hunting on Rapa Nui resulted in deforestation, soil erosion, and extinction or extirpation (death of a local population) for many bird species on the island. These results of human occupation were common in Polynesia. On Rapa Nui, people engaged in spiraling cycles of political and architectural aggrandizement, environmental stress, and warfare. As a result, many of the monumental centers were abandoned, and the island was largely depopulated by the time of European contact.

—James L. Flexner

intensification sometimes resulted in deforestation and increasing erosion. Environmental stresses such as these are closely associated with population decline and abandonment on some islands. In addition to agricultural production, Polynesian economics developed around extensive interisland trade networks, even on remote island groups such as Mangareva.

Economics, social stratification, and religion were closely associated in Polynesian chiefdoms. In Hawaii a rigidly hierarchical society emerged in which absentee lords controlled the development of crops and prestige items through a series of lesser chiefs and administrators. Commoners in Hawaii suffered from a unique historical development in Polynesia in which claims to land were forged through labor and tribute to the chief, as with peasants in medieval Europe. Typically, Polynesian ties to the land were established

through kinship. Kinship structures in these chiefdoms were based upon a ranked system in which individuals were placed within a stratified social hierarchy based on birth order and the rank of their lineage. Power and status were inherited, but unlike the more recent European monarchies, the power of chiefly lineages was symbolically as well as materially linked to historical ties to the land rather than to the power of the bloodlines themselves. In New Zealand, cycles of warfare between lineages competing over land led to the widespread establishment of *pa* (hill forts), one of several examples of defensive architecture in Polynesia. Archaeologically, the remains of Polynesian sacred sites, especially temples of stacked stone, found in Hawaii, Rapa Nui, the Marquesas, and elsewhere, have been important markers of the development of hierarchical political structures in societies where chiefly power and religion were closely linked.

The development of chiefdoms in Polynesia created different histories for different island groups. On the eve of European contact, islands such as New Zealand and Hawaii sustained large populations with burgeoning economies and flourishing cultural developments, while islands such as Mangaia and Rapa Nui suffered from deforestation and population decline. The variability of cultural forms in Polynesia resulted from a combination of the biogeography of islands and island groups and the cultural choices of Polynesian people who settled the islands.

■ Introduction: Early Modern Political Systems

Early modern political systems were diverse, although one thing that most had in common was a form of hereditary one-person rule known as monarchy. Republican regimes were rare, and even those often had a

figure occupying a role resembling that of a monarch, like the Doge of Venice or the stadtholder of the Dutch Republic. Single individuals stood as both final authorities and foci of loyalty in a world where national and institutional loyalty

RISE OF EUROPEAN NATION STATES

were weaker than they later became. Monarchs often occupied multiple roles. In Europe multiple monarchy was common; from 1603 to 1707 the king or queen of Great Britain was actually the ruler of England, the ruler of the separate kingdom of Scotland, and the ruler of Ireland, which was also subordinated to England. The king of Spain was actually the king of Aragon, itself a monarchy with strong multiple elements, and the king of Castile as well as duke of Burgundy, the duke of Milan, and numerous other titles in the Old World and the New World alike. Although their positions were less formalized, the Qing emperors of China were also leaders of the non-Han Manchu people and Mongol khans as well as Confucian emperors of China. Monarchs also frequently enhanced their status by occupying religious roles, as protectors of a particular

religion such as the Songhai monarchs worked to advance Islam or as sacred figures themselves, like the Chinese “Son of Heaven.” Where faraway monarchs could not directly wield power, they could be represented by viceroys, people who stood in the place of the monarch, like the Spanish viceroys of Mexico and Peru.

Generally, political systems were becoming more centralized, along with the rise of standing armies equipped with guns. The term “gunpowder empire” refers to the necessity of a centralized state controlling the powder, ammunition, and guns that were central to a modern army, as the gunless Songhai found out when invaded and crushed by the gun-wielding Moroccans in 1591. The principal domestic obstacle to centralization for many rulers was the landowning aristocracy. Absolutist European rulers such as Louis XIV of

France (r. 1643–1715) tried to reduce the political independence of their aristocracy while harnessing their talents and wealth for state use. Peter the Great of Russia (r. 1689–1725) tightly bound the aristocracy to the civil and military service of the tsar. England, Sweden, Poland, and a few other countries in Europe institutionalized the relationship of landowners and other economically and socially powerful elites to the monarchy through parliaments, although these institutions were declining from their late medieval height and eventually disappeared in other absolutist European countries like France and Spain.

Control of wealth from the increase in world trade was another concern of rulers. Indeed, some trading companies like the Dutch East India Company and the English East India Company were practically sovereigns themselves. Port cities connected to the New World economy became ever more valuable possessions, as can be seen in the rise of port states in Southeast Asia at the expense of inland states with the growth of first Chinese and then European trade or Peter the Great's building of St. Petersburg on the Baltic to replace inland Moscow as Russia's capital.

—*William E. Burns*

African Politics

The picture of sub-Saharan Africa as a complex political mosaic emerged in the European imagination and in reality between 1450 and 1770. Through Muslim and European travel accounts, an integrated view of Africa began to take shape outside the continent. Mapping known coastal states and piecing together information about kingdoms in the hinterland from compilations of hearsay, anecdotes, and merchant tales translated from a variety of sources, scholars, and compilers produced printed and illustrated cosmographies and geographies of faraway lands. They worked on behalf of sultans, popes, and kings, recognizing the commercial value of a more intimate knowledge of the globe's regions. The geography and political economy of previously inaccessible parts of Africa south of the Sahara gradually came into focus.

Not only images of the continent but also political entities themselves competed. Notably during this era, the ideologies of Christianity

and Islam were grafted onto preexisting state systems. Political rulers converted to new religions to gain access to diplomatic and commercial networks otherwise beyond their grasp. The Muslim mansas of Mali or Sonni Ali (1464–1492) of the successor state of Songhay, the Christian kings of the Kongo, and the sultans of Zanzibar all became players in the globalized trade in people and their products. Of the small states and larger political orders in place between 1450 and 1750, virtually all relied on long-distance trade, and many relied on slave labor and other systems of inequality.

From the Guinea Coast to the savannas and forests, small states controlled a myriad of West African microenvironments and their resources. The extent of Islam's spread was largely limited to regions where horse-mounted cavalry could be successful. The army of Islamic Songhay captured Timbuktu on the Niger in 1468 and protected a far-flung empire and its trade routes until the eighteenth century, when the empire dissolved into smaller states. One of these was the kingdom of Segu, which Scotsman Mungo Park proclaimed an unexpectedly magnificent place when he visited in 1796.

Among the interior tributary and city-states of the Bornu and Hausa, the spread of Islam beyond the elites to the masses set the stage for conflict and revolution in the nineteenth century. And an even more ominous presence to the south heralded the reorientation of the trade in slaves and other commodities. The arrival of European merchants on the coast beginning after the 1430s attracted established trade and migration to new coastal points of interaction, giving a boost to the political economies of forest states like Benin, Dahomey, and the Asante. African women sometimes married European merchants on the coast and found that the avenues of wealth accumulation and cultural negotiation could be frontiers of autonomy.

In Central Africa, the foundations of large states like the Luba, Lunda, and those of Mbundu-speaking peoples also predated the arrival of European traders. King Afonso I (r. 1506–1543) of the Kongo was a Christian convert who opened communications with the king of Portugal and the pope in Rome. Afonso used access to European mercenaries and weapons to expand his

➤ BETWEEN TWO WORLDS—LEO AFRICANUS

The man whom the world would come to know as Leo Africanus straddled the realms of Islam and Christianity, and Africa and Europe, when he found himself in the possession of Pope Leo X in 1518, who quickly released him from slavery. Born al-Hassan al-Wazzan, the diplomat of the Sultan of Fez became entangled in two worlds after his kidnapping by pirates in the Mediterranean. Al-Wazzan converted to Christianity and was baptized as “Joannes Leo” by the pope himself. Al-Wazzan lived in Rome as a scholar for the next nine years, writing for a European audience about Islam and Africa south of the Sudan. It is thought

that he eventually returned to North Africa, but nothing is known of his final years.

Once published in 1550, al-Hassan al-Wazzan’s description of Africa became one of the most influential works on Africa for the next 300 years. The book was a compilation of hearsay, anecdotes, research, and the author’s memories of his own youthful travels as far as Timbuktu. The work is now thought by some scholars to have been composed with thoughtful ambiguity, reflecting the warring worlds in conflict around its author.

—Candice Goucher

territory through conquest. East of Lake Victoria, Bunyoro and Buganda were expanding centralized kingdoms between the sixteenth and eighteenth centuries, an era during which political power relied increasingly on the control over and productivity of labor and land. A significant continuity of political power would be the elite reliance on the sanctions of religious and spiritual authority, whether inherited or imported.

European settlement was on a very small-scale basis and was confined to the trading outposts, with a few important exceptions. The Dutch East India Company’s arrival in the temperate zone of Southern Africa in the mid-seventeenth century led to a larger European presence and expansion at the expense of Khoisan societies between 1650 and 1750. In East Africa, the Portuguese occupation and destruction of coastal ports was followed by settlement. Prazeros were the descendants of Portuguese and Afro-Portuguese traders and hunters who settled in the Zambezi Valley, farming large estates with African labor and promoting trading caravans of slaves and ivory. Territories undefeated by Portuguese armies were defeated by famine and drought.

The inroads made by the globalization of the slave trade in the Atlantic and Indian oceans deepened inequalities in African societies. The introduction of firearms escalated the conflict between small states and furthered new forms of exploitation across the continent. The stage was set for increasing dependence on foreign

trade, with even greater misery and violent conquest in the centuries to follow.

East Africa—Omani Rule and Portuguese Retreat

The first Europeans to appear in India were the Portuguese with the voyage of Vasco da Gama in 1498. Soon after, more ships arrived as the Portuguese sought to create treaties with the locals in order to trade goods. Matters became complicated when the local Muslim merchants, who resented the interference of the Portuguese in a trade that was already well established in the area, began to resist the intruders with force. Intent on establishing their trade there, the Portuguese king Manuel I sent Francisco de Almeida to Cochin in 1505 as the first viceroy of India, with the intention of establishing forts in order to protect their interests. The establishment of a military presence in India brought more

➤ ZANZIBAR, ISLAND OF SLAVES

The first visitors to Zanzibar, Arab merchants during the eighth century, called the island *bar iz-zanj*, or “coast of the black man.” They also brought Islam and a new language that combined the idiom of the local coastal (*sahil* in Arabic) population with Arabic and Swahili. The Arabs built many trading posts and established brisk business relations with India. In 1503 the Portuguese landed on the main island of Unguja and soon controlled the entire trade in the Indian Ocean.

Toward the end of the seventeenth century, Portugal lost all East African territories north of Mozambique to the imam and sultan of Oman. Over the next 200 years, this dynasty developed the islands into the center of the slave and spice trades in the East African hemisphere. The trade involving slaves and ivory and the cultivation of cloves made the islands both prosperous and infamous. Annually between 6,000 and 10,000 slaves were traded, amounting to an estimated 75 percent of the total population.

In return, the Omani masters of Zanzibar developed close relations with Western powers and remained independent for a long period of time. They were, however, dependent on the purchase of weapons in order to maintain the slave trade in East Africa. When European countries promoted the abolishment of slavery in the nineteenth century, they pressured the sultan of Zanzibar to end the slave trade. British ships chased local dhows, traditional Arab sailing vessels, that carried the human cargo. For several decades, however, the slave trade continued illegally, with shipments going from Somalia to Arabia.

—Sebastian Maisel

Portuguese, and they began to explore the land, reaching the Omani Gulf area in 1507. They conquered Zanzibar in 1503, Socotra in 1506, and finally the Omani coast in 1507. Their objective was to block the Strait of Hormuz and the Bab al-Mandab so that they could better control the trade routes to Asia. In the course of this expedition, almost all Omani port cities (Muscat, Sur, Sohar) were conquered, plundered, and destroyed. Resisting groups were killed, and ships were sunk. Military success is attributed to the use of artillery and gunpowder, which easily

penetrated the adobe walls and wooden ship planks of the Omanis. As a visible sign of Portuguese power and dominance, they built large fortresses along the coastline.

This dominance would not last for long. Although there were certain parts of India that the Portuguese would always control, other powers soon became involved in the area and sought their own control. The Ottomans were able to control the area during 1550–1551 and 1581–1588. By the end of the sixteenth century, the English, Dutch, and French were beginning their own maritime expeditions, and by the early seventeenth century all three appeared in India, eager to establish their own trading centers. In addition, back in Europe, Portugal had been appropriated into the Spanish empire in 1580 and would remain so until its independence in 1640. This caused problems for its overseas empire, as men and money normally used for their defense of the empire were slowly moved to fight the various wars that the Habsburg kings were involved in. In addition, the Dutch, English, and French could now treat their former ally as the enemy, since Portugal was now a part of Spain, their enemy.

The Portuguese soon felt the consequences. After a Persian attack supported by England, they had to evacuate the island of Hormuz in 1622. At the same time, Nasir bin Murshid from the Al Yaruba dynasty started to unite the Omani tribes of the interior in order to expel the Portuguese from Oman. He was chosen imam, a position that became hereditary in his family. Step by step the Portuguese had to give up the coastal towns of Sohar and then Sur in 1634 and finally, under Nasir's successor Sultan bin Saif, Muscat in 1650. Sultan bin Saif also expelled them from the many formerly Arabic trade posts along the East African coast. In 1652 he conquered Zanzibar and in 1655 Bombay in India. Under the sultan's rule a large armada of battleships and merchant vessels was built, which secured the trade with India and Africa. Imam Saif bin Sultan, son of Sultan bin Saif, finally expelled the Portuguese from all of their East African territories except for Mozambique, and the country developed into a maritime powerhouse in the Indian Ocean.

Controlling the intermediate trade between India and Africa, Oman experienced economic growth. From their bases in East Africa, Omani

merchants operated a thriving slave trade with the Islamic world. In addition, agriculture was promoted through the expansion of a large net of irrigation projects. Economic prosperity enabled a large-scale building boom whereby palaces, fortresses, and residences were built in Muscat, Nizwa, and other towns.

A sharp decline started during the rule of Imam Sayf bin Sultan, who had to compete against several rivals due to his young age. Civil war erupted and led to the polarization of the society. Imam Sayf bin Sultan invited Persian troops but was eventually toppled, and the Iranians took control of most of the country. Ahmad bin Said, since 1744 leader of the Albu Said tribe, was elected imam and replaced the Yaruba dynasty. The Omani tribes were again united against the Persian invaders and expelled them; in 1746 the Albu Said dynasty was founded, and its rule has lasted until the present day.

After addressing internal political problems, Sultan Ahmad bin Said joined an agreement with Portugal over spheres of interest in East Africa. Thus, the way was clear for the expansion of Omani rule. The focus of the country shifted to the prosperous coast of eastern Africa, where the trade of slaves for the plantations in America and the Caribbean and of spices, especially cloves, flourished. Omani merchants operated deep into sub-Saharan Africa. Zanzibar became the new residence of the sultan; the country's name was changed to the Sultanate of Muscat and Zanzibar. The Portuguese retained a presence in India until the twentieth century, but it was a minor one.

The empire, however, began to fall apart after the death of Imam Said bin Sultan in 1856 due to the power struggles over succession among his sons. In 1861 a treaty was brokered with the help of the British that formalized the official separation of the country into the Sultanate of Muscat and Oman and the Sultanate of Zanzibar. The decline was furthered by three additional aspects: the opening of the Suez Canal in 1869, which left the ports of Oman useless; the development of steamships, which reached the Indian Ocean in 1865 and were far superior to the sailing dhows of the Omanis; and finally the abolishment of slavery and the concurrent crash of the market. Government revenues collapsed,

and within a few years the once-mighty Oman lost its importance, and the Albu Said lost their power. Finally, in 1893, the sultanate became a British protectorate.

Songhai—Last of the Savanna Empires

The origins of the Songhai empire date back to the ninth century CE, when the inhabitants of the city of Gao, located near the Niger Bend region of what is today eastern Mali, began to expand their power over the surrounding region. Drawing upon floodplain and rain-fed agriculture as well as river resources (including fish and hippopotamus), the region provided a solid surplus of food to help develop a thriving urban and economically diverse society.

In the later thirteenth century, the city was incorporated into the expanding Mali empire as a subject region. However, as Mali fell into decline in the fifteenth century, Gao reasserted its independence, first as a powerful city-state and eventually as an empire in its own right. It was under the rule of Sonni Ali that the Songhai empire began to take shape, seizing control over Timbuktu in 1468 and Jenne in 1473. By the latter 1480s, Songhai had grown to control a huge swath of the West African savannas and Sahel (the so-called coast between the desert and grasslands), extending from present-day Niger westward to the Atlantic coastline of the Senegambia. As with earlier Ghana and Mali, this east-west orientation allowed Songhai to control the flow of gold out of the forest regions of the south and the salt that was transported from the northern Sahara into the savannas.

➤ TWO VIEWS OF SONNI ALI

Sonni Ali (sometimes identified as Sunni Ali Ber), is generally credited with the founding of the empire of Songhai. As the empire of Mali fell into decline, the Sonni dynasty, based in Gao on the Niger River, expanded its military and economic reach to fill this power vacuum. Sonni Ali came to power around 1464. Utilizing cavalry-based land forces and naval forces based on the Niger River, he expanded the regions under Gao's control extensively, capturing Timbuktu in 1468 and Djenne in 1473. The region under Sonni Ali's control became so great that it was later dubbed the "Songhai empire." Despite his military victories, he eventually came into conflict with the region's urban Muslim populace, who accused him of being a poor Muslim. After Sonni Ali drowned in the Niger in 1492, his son and successor, Sonni Baru, was overthrown by Muhammad Ture, who founded a new dynasty, which ruled until 1591.

Interestingly, Sonni Ali's historical legacy is contested. Having run afoul of the region's Islamic scholars, Sonni Ali was derided as a harsh and illegitimate ruler in such important sources as Abd al-Sadi's *Tarikh al-Sudan (History of the Sudan)*. Sonni Ali, however, eventually found modern defenders in what is often termed Afrocentric scholarship. In this twentieth-century literature, such as in works by Chancellor Williams, Ali is represented as a great hero of African tradition who fought against the "foreign" influence of Islam and Arab culture. Such a contrast offers excellent insight into the importance of identity in the writing of history.

—Jonathan T. Reynolds

Although a gifted military commander, Sonni Ali found himself challenged on religious and political grounds. As had been common for many of the region's rulers over the previous three centuries, he appears to have sought to strike a balance between the practices of Islam and indigenous local religions. However, by the late fifteenth century the expanding practice of orthodox Islam among the region's increasingly powerful merchant and scholarly classes had created an environment that was unfriendly to such overt blending of religious practices. Sonni Ali found himself attacked for his lack of

Islamic piety. In 1492 the region's Islamic scholars announced that Sonni Ali could not legitimately rule over the region's Muslim populace, and shortly afterward he drowned in the Niger River. His son, Sonni Baru, sought to maintain power but was soon overthrown by Muhammad Ture. Taking the name Askiya Muhammad, Ture announced his desire to rule the region according to Islamic precepts and offered expanded state support for the region's *ulama* (Islamic scholars).

Askiya Muhammad's rule expanded Songhai's power as the empire extended its authority northward to some of the Sahara's richest salt deposits and southward to the edge of the West African forest region. To bolster his legitimacy, he also undertook a pilgrimage to Mecca in 1495. A dynastic crisis in 1528, however, led to his overthrow by his son Askiya Musa, who was himself unseated by his brother Ismail in 1537. A long period of peace prevailed under the rule of Askiya Dawud from 1549 to 1582. In particular, this time saw the ongoing expansion of Islamic scholarship in the region.

By the late sixteenth century, however, a major economic shift was under way in the West African savannas. Portuguese access to the West African coastline, particularly at El Mina in what is now southern Ghana, meant that new markets for West African gold were undercutting this important component of the trans-Saharan trade. Certainly Songhai still profited from many other forms of trade, but the significant decline in the quantity of gold moving across the region was a major blow. In 1591 the Moroccans sent an army across the Sahara to invade Songhai. Equipped with firearms, the small Moroccan force defeated the Songhai army and was able to unseat Askiya Ishaq II from the Songhai throne. Notably, the Moroccans profited little from their conquest, in no small part because the trade in gold had already declined to a trickle. The invasion and subsequent collapse of the Songhai empire did, however, set off what is often referred to as the Dyula diaspora, a movement of Muslim merchants and scholars out of the region and into other parts of West Africa, an event that did much to lay the groundwork for the ongoing expansion of Islam in the region.

The White Man's Grave—How Extensive Was Early Contact?

As Europeans ventured forth by sea to new worlds in the Americas, Africa, and Asia, they encountered new disease pools that limited their interactions. Tropical diseases killed Europeans in large numbers, often at rates five to ten times higher than if they had remained in Europe. Consequently, for centuries after 1492 Europeans did not dominate the world, particularly in tropical areas, but instead worked within existing political and economic systems. Vastly outnumbered, they had to rely on local help and contacts to trade and establish colonies. It was not until the nineteenth century that medical practices and vaccines sharply reduced European deaths in tropical regions and allowed them to expand their presence.

Africa was the first new landmass that Europeans explored as sailors ventured south in search of gold and later slaves during the late fifteenth and early sixteenth centuries. And because of disease, it was Africa that proved most difficult for Europeans in establishing permanent settlements. With no natural immunities and without effective medical practices, Europeans who traveled to tropical Africa died at enormous rates, particularly from malaria and yellow fever. Soldiers stationed in Africa died at rates sometimes in excess of 50–60 percent in a single year. This required a constant supply of new troops from Europe who were just as susceptible to disease. The west coast of Africa developed such a notorious reputation in

Europe that it became known as “The White Man's Grave.”

Disease was so lethal that Europeans were relegated to the African coastline, establishing a few forts and settlements and hoping to keep their contact with disease to a minimum. Except in the Cape Colony with its more temperate climate, Europeans were unable to penetrate the interior of the continent or establish colonies until medical advancements in the mid-nineteenth century. Due to their limited numbers, the colonizers relied on local peoples for inland trade and contact. In Africa, this meant that the slave trade was conducted through African intermediaries who brought slaves to the coast, where they were then sold to European traders who shipped them across the Atlantic.

Yet Africa was not the only place where disease limited European numbers. In the New World, European colonists suffered too. In addition to bringing a disease pool that decimated the Native American population of the Americas, contact with Africa introduced the same lethal diseases of yellow fever and malaria to the Americas. In the Caribbean, disease contributed to the short life span of Europeans and African slaves and to the need for a constant supply of new slaves from Africa. Caribbean plantations remained overwhelmingly African, and white landowners often managed them in absentia, in part due to disease. When French troops entered the colony of St. Domingue to put down a rebellion in 1792, over half of the 10,000 troops died from disease. In the North American colonies during the early seventeenth century, 40 percent of new arrivals perished within a few years, with higher death rates in the colonies of Virginia, Maryland, and South Carolina.

In some areas of the Indian Ocean, such as Southeast Asia, European colonies relied upon slave labor as well as local workers to function because disease reduced the already small number of Europeans in the region. In these places, high mortality and few European women meant that local women often entered into business relationships with European men, often through marriage. These women not only had local business connections and understood the culture but also often survived their husbands and inherited their businesses. Partly because of disease,

BRITISH ARMY DEATHS IN THE TROPICS

Location	Average Annual Death Rate per 1,000 troops
Great Britain	15
India	30–75
West Indies	85–138
Western Africa	483–668

This table gives an example of the high death toll for Europeans in tropical areas by looking at British troop deaths during 1680–1834. While the high death rate for western Africa underscores why it earned the name “White Man’s Grave,” the comparatively lower death rate in India offers a reason why Europeans believed India to be a temperate climate suitable to European colonization during this period.

—Thomas Anderson

Source

Mark Harrison, *Disease and the Modern World: 1500 to the Present Day* (Cambridge, UK: Polity, 2004).

European colonies in Asia were dependent on local troops, sailors, traders, and bureaucrats to run the emerging imperial networks, which fostered a need for dialogue and negotiation. These close connections led to an exchange of knowledge ranging from shipbuilding techniques to medical practices.

By the nineteenth century a variety of factors including better hygiene, sanitation, water supplies, and medicine, such as the use of the drug quinine to protect against malaria, began to sharply reduce European deaths. Indeed, the age of European imperialism that began during the nineteenth century stemmed not only from economics and technology but also relied in large part on the lower death rates of Europeans. It was during this period when Europeans gained economic, political, and territorial control over large swaths of the world. Until this period, however, Europeans operated in a world where they were outnumbered and often worked in tandem with local peoples.

The Ottoman Empire as a Superpower

Between circa 1450 and 1770 the Ottoman empire became a formidable superpower in Europe, West Asia, and, after 1517, North Africa. During this period the Ottomans twice besieged the central European city of Vienna; conquered Constantinople, which had stood as the capital of the Byzantine empire (or eastern Roman empire) since circa 330 CE; and brought much of the Arab Middle East under their control. In the process of acquiring this empire, the Ottomans came into contact with many different peoples. Although the ruling family was a Muslim dynasty, the Ottoman empire had a significant minority of non-Muslim subjects, most of whom were Christians although there were many Jews as well. Unlike late medieval and early modern Europeans, the Ottomans were a tolerant empire that benefited from the abilities of their diverse subjects, although non-Muslims were not technically equal to Muslims.

It is difficult to point to any one move that led to the Ottoman ascendance, although there are several key elements of Ottoman success that cannot be overlooked. First, the Ottomans emerged as gunpowder empire, utilizing gunpowder-related weapons into their mobile armed forces much earlier than the emerging European powers. Thus, the Ottomans often employed siege cannons on their campaigns, perhaps the most famous instance being their capture of Constantinople in 1453. The Ottomans were also willing to integrate individuals from their Christian populations into their ruling class through the *devsirme* system. Under this system Ottoman authorities visited Christian villages in order to identify boys they believed to show both

OTTOMAN EMPIRE IN LATE 17TH CENTURY

great physical and mental potential. These boys were brought to the imperial centers, where they were trained for future government service. The boys received an excellent Ottoman education, and the highest-achieving individuals became advisers to the sultan's household, while the others became lifelong members of the Janissaries, the sultan's elite military force. Finally, the Ottomans were also able to further tap into their Jewish and Christian populations by allowing these groups to live, work, and worship freely as long as they paid a special tax. While these groups were not granted full equality with Muslims at this point in Ottoman history, they were active in the empire. They were encouraged to become productive members of society and were treated far better than minority groups in European states at this time.

The reign of Suleyman the Magnificent (r. 1520–1566) was arguably the high point of the Ottoman empire. At this time, the Ottomans were the single strongest military power in West Asia or Europe. They had recently added to their territory large swaths of North Africa along with the majority of the Arabian Peninsula and areas west of Iran along the Persian Gulf. Despite this, a significant reason later writers associated Suleyman's reign with the Golden Age of Ottoman history is that this is the way he portrayed his own rule. Similar to the Roman emperor Augustus, Suleyman commissioned artists, writers, and the development of buildings in order to bolster the empire and its culture. He also became famous for the promotion of Ottoman law and was known as the *Kanuni* (law giver). During the rule of his successors, the Ottomans carved out

a large empire in West Asia and Europe and established strong centralized rule, at least for this time period, centered around the sultan and his household.

Like all empires in this period, the Ottoman empire operated in an international environment. Yet because of his power relative to neighboring rulers in Europe and the Middle East, the Ottoman sultan considered himself and his state above other kingdoms. The Ottoman sultan could act unilaterally in proclaiming peace and war or giving gifts to other states. Yet there were instances when the Ottoman ruler did view a foreigner as an equal. In the sixteenth century Suleyman forged an alliance with King Francis I of France in which Suleyman apparently recognized Francis as his equal. Both of these men viewed the Holy Roman Empire as a chief rival. This alliance also highlights the fact that the Ottomans could and did ally with Christian states in Europe. Thus, the Ottomans acted like most successful empires; they fought, negotiated, and coexisted with the states around them regardless of religion.

The Ottoman sultanic concept of unilateral concessions also extended to the economic realm. Like China, the Ottomans believed that only Ottoman subjects deserved the full protection of Ottoman laws within the empire. Therefore, foreign merchants and residents within the Ottoman empire were often without legal protection and were subject to customs duties and taxes. Yet the sultan occasionally granted capitulations to foreigners to gain access to certain commodities or skills. This meant that these foreigners were able to operate in the Ottoman empire under their own government's laws and were exempt from Ottoman laws and taxes. During the sixteenth century when these capitulations began, they were mainly beneficial to the empire, but by the eighteenth century this system had become detrimental to the Ottoman economy.

Although the Ottomans did not acquire overseas colonies, they had a significant impact on global affairs in this period. It is generally agreed that a significant reason behind western European countries looking to transoceanic voyages to find routes to East Asian and Indian markets was that the Ottomans controlled the overland routes. The Ottomans also allied with various

cities and peoples along the Asiatic coast of the Indian Ocean in order to prevent Portuguese naval domination of the area. Furthermore, during the fifteenth, sixteenth, and seventeenth centuries the Ottomans often found themselves at war with their neighbors. These conflicts included an Ottoman-Hungarian war, Ottoman-Habsburg wars, the Ottoman-Mamluk war, and Ottoman-Safavid wars. Thus, the Ottomans fought Catholic and Orthodox Christians as well as Sunni and Shia Muslims.

Although the Ottomans remained a major power, during the seventeenth century their empire had begun to change. During the fifteenth and sixteenth centuries the sultan had been the empire's chief political and military leader. Although the imperial center remained powerful, the political and military roles of the sultan changed as his advisers and household members rose to prominent positions. By the eighteenth century power had devolved even further to provincial leaders, often Janissaries, members of a group that had begun as the sultan's personal army but had grown into a quasi-hereditary group that had spread throughout the empire and forged local alliances with merchants and provincial notables. Although still a major power, the Ottomans had to also begin dealing with the emerging powers in western Europe and the new Russian state.

The Mughals in India

The Mughal empire was founded in 1526 by Zahiruddin Ahmed Babur, a ruler from Central Asia. After entering India and defeating the ruler of the Delhi sultanate, Sultan Ibrahim Lodi, Babur

helped to establish the Mughals as one of the most powerful and wealthy empires of the early modern era. However, Babur's descendants became central to the establishment of the empire.

Babur's son, Humayun, became emperor in 1530, although he was forced to flee to Persia (Iran) during part of his reign. It was during his time in Persia that Humayun developed an interest in Persian art, literature, and culture, forming a connection between Persian and Indian cultures and Islam and Hinduism that defined the empire. When Humayun died unexpectedly in 1556 as he slipped and fell while hastening toward his prayers, his son Akbar ascended the throne when he was a young teenager. Akbar ruled until 1605 and became a defining leader of the empire. During his rule, the Mughals developed a fiscal and administrative structure that was extensive, efficient, and relatively fair. The economy relied upon agricultural productivity and complex trade networks (in India and in the Indian Ocean). Agricultural taxes, which were the main sources of imperial revenues, took into account crop rotation, productivity of soil, and other extenuating circumstances. Akbar and later emperors also developed a judicial system that was accessible and reasonable, with village representative bodies to adjudicate most minor cases according to local traditions and customs.

Beginning with Babur, the Mughals had a well-organized and intimidating military. The emperor controlled extensive forces, including the cavalry, infantry, and artillery divisions; an infrastructure of logistical support; and large numbers of horses and elephants. Moreover, the emperor also had access to the forces under the *Mansabdars* (state functionaries who commanded their own troops, had to swear allegiance to the emperor, and were assigned territories [*jagirs*] from which they collected land revenues that they shared with the emperor according to established rules). Along with a large army, the Mughals also utilized advanced weapons for their time, and they became known as a gunpowder empire due to their use of artillery. This military facilitated the expansion of the Mughal empire, an empire that encompassed most of northern India by 1605 (under Akbar) and controlled nearly all of South Asia by 1707 (under Aurangzeb).

➤ AURANGZEB AND DARASHIKOH, 1658

One of the defining events in Mughal history concerns the crisis of succession following Emperor Shah Jahan's illness in 1658. In the contest for the throne, Dara Shikoh, Shah Jahan's eldest son and the favored and popular heir apparent, was outmaneuvered and eventually killed by his brother Aurangzeb (r. 1658–1707). The contrasts between the two brothers were vivid and substantive. Dara Shikoh was enlightened, scholarly, and a sensitive patron of art and culture. He was a devotee of Sufi saints and wrote extensively on religious issues from a mystical perspective. He also translated Hindu texts, reached out to the Sikhs, and followed his great-grandfather (Akbar) in his pursuit of religious understanding and humanistic ideals. Aurangzeb, while not a hateful zealot, was nonetheless a devout Muslim whose faith informed and inspired his personal life and public policies. He sought to impose an Islamic stamp on the empire by undoing some of Akbar's tolerant traditions (e.g., by reimposing the *jizya*, a tax on non-Muslims). He also was a talented military leader who spent the last 26 years of his life fighting against Hindu kingdoms in southern India to expand the empire. Yet as he increased taxes on the peasantry to finance his military campaigns while he also alienated regional Mughal allies, Aurangzeb contributed to the process that led to the splintering of Mughal authority after his rule. What if Dara Shikoh had prevailed in 1658?

—Ahrar Ahmad

In addition to their military, the Mughals became famous for their support of art and culture. Following the interest in Persian culture starting with Humayun, Akbar and his descendants patronized new systems of art, culture, and architecture. The Mughals encouraged an artistic and aesthetic courtly culture that was exceptional and eclectic. Emperors patronized musical talents that devised a new vernacular of Indian classical music, and they also supported court poets and a new genre of miniature painting. In addition, the Mughals sponsored an architectural creativity that was ingenuous and imaginative. For example, Shah Jahan (r. 1628–1658) the grandson of Akbar, presided over an era of architectural achievements. Jahan developed the

capital, Delhi, and patronized the building of the famous Taj Mahal.

The Mughals were also known for their enlightened approach to religious issues. While some examples of intolerance may be found, Mughal rulers were essentially practical Muslims who found it easier to treat the Hindus as *dhimmis* (protected groups) and incorporate them into the framework of the empire. A substantial number of Hindus functioned in the upper echelons of the Mughal administration, including some who served in the imperial cabinet or as royal advisers. Under Akbar, laws that imposed special taxes on non-Muslims were repealed. In addition, many Mughal rulers personally exemplified the practice of interfaith marriage. Akbar personally illustrated this environment of openness when he inaugurated the *ibadat khana* (house of worship), a place where representatives of various religions (including Christian missionaries) were invited to engage in spirited debate and discussion.

As a result of these developments, the Mughal empire encouraged a fusion of cultures, religions, and ideas. This fusion continued even under Aurangzeb (r. 1658–1707), a leader known for a more conservative approach to Islam. Although he had a complex relationship with Hindus (especially regional Hindu leaders), Aurangzeb continued to employ Hindus in his administration. His main focus, however, was the expansion of the empire, and he exerted much of his efforts to ruling the entire Indian subcontinent. After Aurangzeb's death, Mughal rulers increasingly relied upon regional leaders to maintain the empire. Emperors also faced growing challenges from internal groups including the Marathas, Sikhs, and Pathans. By the middle of the eighteenth century, the British East India Company, a corporation that began as traders, became collectors and administrators in various areas under Mughal authority. The British eventually abolished the Mughal empire and deposed the "last Mughal," Bahadur Shah Zafar, in 1858; India passed under the direct jurisdiction of the British Crown at that time. However, Mughal contributions to art, culture, literature, and the global economy helped mark one of the most successful empires in the early modern era.

The Safavids in Persia

The Safavid dynasty, which ruled Persia and its dominions from 1501 to 1736 CE, established itself as a Persian ruling family despite its background as the leaders of a largely militaristic Turkic nomadic group. Much like the other two contemporary Muslim regimes, the Ottomans in the Near East and the Mughals in southern Asia, the Safavids were Turkic nomadic invaders who successfully conquered large urbanized and economically developed empires, supplanted the native ruling elites, and adopted aspects of their culture and lifestyles. Furthermore, the Safavids installed Twelver Shiism (Shia branch that believes that Twelve Imams were the legitimate successors of Ali) over a largely Sunni Muslim population as an aspect of centralizing theological and social control over their conquests. The early Safavid state was characterized by constant wars of expansion, directed toward Anatolia, Mesopotamia, central Asia, and the Caucasus, for the purposes of acquiring wealth and lands for the military.

The first Safavid shah, Ismail (r. 1501–1524), installed himself as the ruler of Persia, thereby displacing the Timurid dynasty from power. In order to consolidate his gains, Ismail imposed Twelver Shiism over his dominions. By tracing the ancestry of the Safavid dynasty to Sufi leader Safi al-Din (1252–1334), Ismail sought to appeal to the religious proclivities of Turkic nomads settling within his dominions. However, this led to the forced imposition of this form of Shiism over the mostly Sunni Persians. Moreover, the Turkish military elite, known as the *quzurbash*, wore red hats with 12 pleats in commemoration of the 12 Shiite imams. As the main advocates of expansion, the quzurbash were the crack troops of the Safavids

in their wars of expansion. For their service, they were awarded newly conquered lands and governing roles in the provinces, replete with levied troops and access to wealth through taxation.

The zenith of Safavid power occurred during the reign of Shah Abbas the Great (r. 1588–1629), who instituted a great deal of administrative reforms to consolidate his power and spurred economic growth by encouraging international trade. Among his reforms was the modernization of the military by incorporating European weapons and the establishment of a standing army, made up of former slaves (*ghulams*) and Persian peasant recruits who swore loyalty to the shah. Furthermore, he expanded the central government bureaucracy, staffed mostly by Persians, to assume many administrative duties across his dominions. However, both of these reforms struck at the privileges of the *qizilbash*. Abbas found these reforms to be necessary in order to provide stability, as economic prosperity had previously been derived from military expansion, which was no longer possible. Moreover, the *qizilbash*, which had been originally designated as the provincial aristocracy and military elite, were becoming a threat to the power of the dynasty itself.

Both long-term and short-term developments led to the fall of the Safavid dynasty by 1736 CE. The administrative reforms imposed by Abbas, while stimulating economic growth, were matched by increased taxation on much of the populace. The expansion of the state and the military at the expense of the regional *qizilbash* aristocracy exacerbated political rivalries and did little to alleviate external pressures by outside forces. The forced imposition of religion on newly conquered peoples and peripheral regions created a great deal of resentment directed at Safavid rule. While high taxes went to pay for lucrative palaces and amassed wealth, Persian peasants became destitute, as rampant inflation drove many of them into dire straits. This inflation occurred due to the entry of specie, particularly silver, into Persia as a result of increased trade with Europe and Mughal India. Incompetent governance on the part of Shah Abbas II and his incapable subalterns further led to the growing unpopularity of the Safavids throughout their realm. Afghan insurgency and popular discontent against the dynasty was rampant in

➤ ABBAS I

Safavid shah Abbas I “the Great” (1588–1629) entered power during a time of great discord in the Persian realm. Internally, the *qizilbash* military elite were actively threatening the power of the shah by conspiring against the royal family as well as expanding their own power within their dominions through their administrative capacities as subordinates of the shah. Externally, the Ottoman empire and the Uzbeks were actively expanding their territories at Safavid expense. Abbas sought to resolve these centripetal and centrifugal forces threatening his power by instituting a loyal standing army, composed of former slaves and Persian conscripts, to counter both *qizilbash* rival power and the external threat posed by the Ottoman Turks and Uzbeks. He further eliminated dynastical conspiracies by isolating Safavid princes in the harem and abandoning their use as administrators elsewhere in the empire. This had the unintended consequence of creating inept rulers among his successors, as they failed to have any sort of political or military training during their time in the harem, being surrounded by drink and women and engaging purely in debauchery.

—Abraham O. Mendoza

the last decade of Safavid rule. Ultimately, the last shah was deposed by his subaltern Turkmen military leader Nader Afshar in 1736, as Persia was immediately threatened by Afghan invasion.

The Estado da India, Portugal's Seaborne Empire

The Portuguese maritime empire was a constellation of trading posts and fortresses. A small nation on the Atlantic Ocean with limited maritime resources was able to pave the way for sustained contact between East and West. By reaching the source of the spices and purchasing direct from the producers, the Portuguese undercut the previously established markets in Venice and Antwerp that relied on Asian intermediation. Breaking into the intra-Asian trade required such tactics and strategies as intermarriage with the local elite and entering into trade contracts with Asian monarchs.

The term “Estado da India” (State of India) covers the Portuguese empire in the East, ranging from the Cape of Good Hope to China. Although the term defined the official remit of Portuguese power, unofficial trading by the Portuguese extended its influence far beyond these geographic confines. This, however, does not imply that the Portuguese ruled the entire coastline within these boundaries. The geographic limits of the viceroy of India's jurisdiction was over all Portuguese settlements and interests between the southern tip of Africa and the lower Yangzi River, which meant both official and unofficial Portuguese settlements within these boundaries

but nothing else. The majority of the coastal lands and cities remained outside of Portuguese control and interests.

Thus, the Estado could be considered a network linking a series of nodes, each with a formal Portuguese administration, conforming to an approximately common pattern. While the narrow and formal definition of the Estado applied to legal and bureaucratic matters, the broader definition was assumed in practice. The viceroy, or governor, resident first in Cochin and later in Goa on India's west coast and complemented by officials and a fortress stood at the pinnacle of this imperial mercantile machinery. Among other duties, he entered into commercial contracts with local rulers on behalf of the Portuguese king. The Estado, however, with the viceroy's centralized directives, was unwieldy. Its jurisdiction was too wide and not effective in some parts, particularly in Southeast Asia.

Within the Estado, royal monopolies and taxes curtailed the fortunes, and some Portuguese abandoned the Estado to seek larger fortunes. The Portuguese king had a monopoly on certain commodities, but there were leakages, for in reality there were other ready buyers. Pepper, cloves, ginger, cinnamon, nutmeg, sealing wax, silk, and tincal (borax) were taken to Lisbon by clandestine traders, who stored these goods in their houses and avoided entering them in the Casa da India (House of India). The Casa da India was a large warehouse that stored commodities openly and officially brought to Lisbon by Portuguese officials and private traders. It was also an emporium, or marketplace, where these commodities could be bought and sold.

Portuguese diplomatic relations with local rulers ensured that the commodities were sold only to the Portuguese Crown. A monopoly, with one buyer for a commodity, is not profitable to the producer or seller of the goods, as the monopolist fixes the price. There are no free market conditions where demand and supply meet, allowing for the market to determine the price of the commodity. In this restrictive situation, it is understandable that the producers sold their goods to other buyers. On September 8, 1520, the *Ordenações da India* (Acts of India) at Evora listed the commodities that were reserved for the Crown. In 1570, however, the Portuguese

king realized the impracticality of the royal monopoly and opened up the trade to all.

The Portuguese trade on the Malabar Coast in southwestern India began a new phase in international relations beginning in the early sixteenth century. A treaty of commerce and peace was signed with the Zamorin (*Samudri raja*) of Calicut, in 1500. A new trading organization, a *feitoria* (“factory”), was established by the Portuguese on the Calicut Coast and was announced to the mercantile world. A factory was a commercial organization having an autonomous existence set up in the Portuguese empire or in a protectorate through a concession granted by the local rulers. It was also a storehouse for both Eastern commodities awaiting transshipment to Lisbon and for goods brought from Lisbon to be bartered in the East. A *feitoria* also accommodated the special needs of the Portuguese commercial community, providing this separate entity in a foreign land with a Roman Catholic church and its consecrated burial ground, for example. A *feitor* (“factor”) was in charge of all economic, financial, and administrative activities, being the appointed agent of the Portuguese Crown. He regulated Portuguese traders, presided over the courts that meted out justice according to Portuguese law for these Portuguese expatriates, and dealt with the local authorities.

Early in the sixteenth century, the Portuguese were able to capture the trade on the Malabar Coast and set up several fortresses along the coast. As a result, Cochin became the initial seat of the overseas government of the Estado until 1530. Then the administrative headquarters was moved north to Goa, due to the trade available north of Cannanore and the Canara Coast, Goa, and Gujarat. On the Coromandel Coast in the southeast they only had unofficial Portuguese settlements in Pulicat and São Tome and farther north in Chitragong and Hugli. Portuguese supremacy gave way to the Dutch in the Indian Ocean at the end of the sixteenth century and in the early seventeenth century, but their dominance continued in Goa, Daman, Diu, Macau, Timor, and Mozambique well into the twentieth century.

Mercantile networks across northern Europe, the Mediterranean, and southwestern Asia had been built up centuries earlier by a variety of European trading families and cities.

➤ PERO DE COVILHÃ

Whereas the Portuguese voyage spearheaded by Vasco da Gama reached southern India in 1498, Pero de Covilhã who was sent overland reached the west coast before that, in 1488. The reigning Portuguese king, Dom João II, had sponsored several such expeditions, but none had reached the source of spices. Covilhã left Lisbon and traveled overland in the same year that Bartholomeu Dias sailed from Lisbon and rounded the Cape of Good Hope, gaining a glimpse of the Indian Ocean.

In a journey that lasted over two years, Covilhã visited the Persian Gulf and the Swahili coast. Unlike da Gama, Covilhã did not return to Lisbon. On reaching Cairo, he received instruction from his king to proceed to the land of Prester John, the mythical Christian ally somewhere in the East. It is not known if Covilhã's detailed report of his findings and insight into India, the spice trade, and Indian Ocean commerce reached Lisbon. The report would have been a valuable guide for Vasco da Gama. Judging by the petty gifts that da Gama took to barter for oriental spices, it appears that Covilhã's report was not available to da Gama. Covilhã's success illustrates how the Portuguese, who set their minds on reaching the source of spice production, resorted to charting both overland and sea routes.

—Shihan de Silva Jayasuriya

However, a true global market was first created by the Portuguese and the Spaniards, whose trade networks crisscrossed three oceans—the Indian Ocean, the Pacific Ocean, and the Atlantic Ocean—straddling the Old World and the New World. Operating through a constellation of trading posts and fortresses, which were in effect fortified commercial intermediaries, the Portuguese were generally confined to enclaves along coastal areas. In Asia, for example, Portuguese fortresses were erected from 1505, starting from the Malabar Coast. In Africa the foundations of the fortress of São Sebastião was laid in 1506, at Mozambique, to defend eastern Africa from the Turks. Over the years this fort was able to resist Dutch, British, and Omani intrusions and entrenched Portuguese power in eastern Africa until 1975.

Whatever the limitations of their fragile Estado da Índia, the Portuguese paved the way for other Europeans—Dutch, French, and British—to enter the Indian Ocean trade.

Portuguese words that have been adopted by languages in the Indian subcontinent and in Southeast Asia remind us of cross-cultural contact. Liaisons with local women and the generations of Luso Asians enhanced the process of transmitting Portuguese words into the vernacular languages. Largely autonomous groups of Portuguese mercenaries offered their services to Asian rulers and through intermarriage spread Portuguese identity by integrating with the local communities.

China's Turn Inward—Did the Middle Kingdom Isolate Itself?

China during the period 1450–1770 is usually remembered as a time when the country turned inward. Contrary to earlier times, such as the Han (206 BCE–220 CE) and Tang (618–907 CE) when China was in expansion, in this period the Chinese leaders seem to have been preoccupied with internal concerns. The image of China's inward turning became further sharpened by another contrast, one with the West that, during the same period of time, was going through some explosive growth, particularly in the areas of foreign expansion. Such an image appears to fit well with the Chinese experience in the nineteenth century, when it became prey to European imperialism. An inward-turning China from 1450 to 1770 seems to provide a perfect explanation for a fallen China in the nineteenth century. The legend was thus made.

Undoubtedly, there are many signs that show that China in that period was indeed turning inward. The inward turning was reflected in two areas: domestic and international. Domestically, the continuous rivalries between the imperial power on the one hand and the regional and aristocratic powers on the other led to the implementation of a series of institutional reforms. These reforms, which were aimed at strengthening the imperial power, began to bring fruition since the Song times in the tenth century. The trend was that power became increasingly concentrated in the hands of the emperor. The Mongol conquest briefly interrupted this trend, but the founding of the Ming dynasty in 1368 quickly resumed the momentum. Zhu Yuanzhang, the founder of the Ming dynasty, institutionalized one reform that significantly propelled the trend: he abolished permanently the position of chancellor so that the imperial power would have one less potential challenger. The room for individuals to initiate any kind of innovations became increasingly narrow, as the emperor was more concerned about stability than excitement. For example, the emperor often worried more about the potential challenges from his own generals who commanded troops in the frontiers than the threats from outside enemies. The best troops were kept in and around the capital under the emperor's direct watch rather than being deployed in areas where they were most needed.

These domestic institutional changes left a bearing on China's foreign policy. Expansions were no longer the priority, and the drive of exploring land afar was dampened. This was particularly true for the period starting around 1450. It was right after maritime adventures by Zheng He, under the sponsorship of the emperor Zhu Di, from 1403 to 1433, had opened a whole new world to China and brought back tremendous benefits: honor, profit, and a large number of things exotic. As the threat from the Mongols in the north gradually mounted, however, the government shifted its focus away from the maritime exploration to defense in the north. Before the Mongol threat was ever removed, piracy along the southeastern coast increased drastically in the sixteenth century, perhaps as a

CHINA FOREIGN RELATIONS, 15TH–17TH CENTURIES

by-product of the rapid expansion of commerce in southeastern Asia. Together, the Mongols and the pirates constantly kept the Ming rulers busy with defense and redirected their attention, priority, and resources. As a result, China's inward turning became one of the most favored topics for historians as well as the general public.

There was another side of the same story though, one that is less known but is an integral part of the whole picture. First, it might be true that the Ming were often on defense facing the Mongols and later the Manchus in the northern frontiers but were not always so in the south and southwest. The Chinese frontiers in these areas had been a haven for many tribal societies, who since the Han and Tang had maintained a semi-independent status toward the emperor in China. The Mongols took a big step toward

incorporating the regions in their China-based empire by converting the regional leaders from hereditary tribal headmen to regular government bureaucrats. For example, the kingdom of Dali, founded by a Thai-speaking people and located in today's southwestern Yunnan Province, was crushed by the Mongols. This was the movement known as *gaitu guiliu*. While the Mongol Yuan jump-started the movement, it was the Ming who had carried on the expansion in the hinterlands. It took the work of the Qing (1644–1911), the republic government (1911–1949), and the communist government to eventually complete the annexation of the tribes, but the Ming had certainly contributed greatly to the process.

In addition, while taking domestic matters as their priority, the Ming rulers never turned a blind eye to Europe. Beginning from the late

➤ ZHU DI AND THE GREAT FIRE AT THE FORBIDDEN CITY

In 1421, the Forbidden City of Beijing, then the capital of the ruling Ming dynasty, was struck by lightning and caught on fire. By the time the fire was out, the once-magnificent Forbidden City was left in ruins. The fire of 1421 was just one of a series of fires that had hit the Forbidden City ever since Beijing was made the capital. But unlike the other fires, the 1421 fire is believed to have left a profound legacy, affecting orientation of its subsequent policy making. Zhu Di was the emperor at the time of the fire; he came to power in an extraordinary way and in an extraordinary time. The legitimacy of his ascendance to the throne was open to question, as he wrested the throne from his own nephew. He moved the capital from its original site in Nanjing to shift the empire's gravity to his power base in Beijing, and he rebuilt the Forbidden City so that it would better symbolize his legitimacy, power, and influence, a move consistent with his foreign policy, characterized by aggressive maritime exploration. The fire reversed this orientation, however, and maritime exploration was halted in 1433. China turned inward and defensive. The fire of 1421 not only burned down the Forbidden City but also was an omen of the decline of the Celestial Kingdom of China.

—Yi Li

sixteenth century, the Jesuits showed up on the Chinese coast. While their mission to China was evangelical, the Jesuits sweetened the Christian pill with Europe's recent scientific and technological achievements. Matteo Ricci, the Italian Jesuit, came to China in 1583. He stayed for almost two decades and introduced his Chinese hosts to the great things that the Europeans developed, such as the sextant that still stands today in Beijing. Many high-ranking government officials showed tremendous interest and became close friends of Ricci, even though these things were not always familiar and were not always in harmony with their traditional terms. Meanwhile, other exchanges with the Western world also grew rapidly. Sweet potatoes, peanuts, and silver flowed into China as Chinese porcelain, tea, and other commodities flowed out.

Successive Qing rulers not only inherited this legacy of the Ming but also demonstrated a stronger interest in Western learning. The Kangxi emperor (1661–1721) maintained a good-sized advisory board that included many Jesuits; the Jesuits also helped him negotiate the first European-style international treaty with Russia, the Treaty of Nerchinsk, in 1689. The Jesuit presence in China was abruptly terminated soon after that, but the legacy that the Jesuits left behind was tremendous. While Chinese expansion and outreach at that time were dwarfed by their European counterparts, the Chinese had had an “open empire” even during the most inward-turning period.

Muslim Sultanates Replace Hindu States in Sumatra and Java, 1500s

The conversion of most of the population of Indonesia to Islam was connected to the rise of Islamic states in Sumatra and Java. Although Muslims may have been visiting Southeast Asia since the seventh century, it was only in the thirteenth century that Muslim states emerged in northern Sumatra. Before then Muslim traders lived in separate areas apart from the general population. Over time these traders married into and made political alliances with local rulers. Evidence for the presence of Muslim states and local converts consists of travelers' accounts and tombstones with Islamic names and dates from the Islamic calendar. The tombstone of Sultan Malik al-Salih, the ruler of Samudra, dates to 1297. Marco Polo, visiting the region in 1292, noted that while the

interior of Sumatra was populated by groups practicing traditional religions, the coast was inhabited by Muslim converts. He attributes the Islamic presence in the area to the activities of merchants from the Middle East. The Arab traveler Ibn Battuta, who passed through the Straits of Malacca in 1345, identified in many ways a typical Islamic society in northern Sumatra, complete with judges well versed in Islamic law.

Southeast Asia was long involved in international trade. During the fifteenth century such activities became more intensive. Southeast Asia became part of a trade network that encompassed China, India, the Middle East, Europe, the Americas, and Africa. Many of the rulers of the new trade-oriented states embraced Islam. The most important of the new Muslim states was Malacca, located in present-day Malaysia. A Muslim sultan ruled over a cosmopolitan society where people from diverse religious backgrounds came to buy and sell commodities, particularly spices. Its capture in 1511 by the Portuguese marked a turning point in the history of the region. While the Portuguese were ultimately unsuccessful in their plan to dominate the spice trade, their capture of the port marks the start of direct European influence in the region. Ironically, the fall of Malacca also facilitated the spread of Islamic states. New trade centers like Aceh and Penang grew in influence, and Islam was seen by some local people as an attractive counterpoint to the religion of the Portuguese, Christianity.

The fifteenth century saw Muslim states emerging in northern Java in the wake of the eclipse of the last great Hindu empire in Indonesia, Majapahit. According to the Chinese sailor Ma Huan (the secretary to the Chinese admiral Cheng Ho, whose fleet made several voyages in the Indian Ocean region during the early 1400s), much of the coast had been either converted to Islam or settled by foreign Muslims. Demak was the first important Islamic power in Java and by 1550 controlled much of the island, at least in theory. Its leaders were proud of their connections to the *wali songo* (a group of early Islamic missionaries) and to the royal house of Majapahit. The power of the coast was short-lived, as influence shifted to the interior of Java with the

rise of Mataram. Sultan Agung (r. 1613–1646) systematically brought most of central and eastern Java under his control, although he failed to destroy the new Dutch settlement of Batavia (present-day Jakarta).

During the sixteenth century Aceh became the dominant Muslim power in northern Sumatra. Aceh derived its wealth and power through the trade in pepper. The Achenese sultan Iskandar Muda (r. 1607–1636) headed an impressive court given to flamboyant display; he even possessed 600 elephants. His court was a center of scholarship but also a center of intrigue; Iskandar Muda had his own son killed. Aceh was a regional if not a world power. Iskandar Muda corresponded with foreign monarchs like Elizabeth I of England as an equal. However, Achenese attempts to recapture Malacca were unsuccessful.

The Islamic states of Sumatra and Java had to deal with the growing power of the Europeans. The Portuguese and later (more successfully) the Dutch tried to dominate the region economically and then politically. Eventually Europeans would colonize the region, and Muslim sultanates would be absorbed into the Dutch East Indies and the British colonies of Malaysia. But there was nothing inevitable about this process. In fact, rivalries between Islamic states were often just as important, at least in the short term. Thus, the great rivalry in the sixteenth century over control of the Straits of Malacca involved Aceh on one side, with Muslim Penang and the Christian Portuguese on the other. When Portuguese Malacca fell to the Dutch forces supported by Penang in 1641, Portugal had vainly turned to its old rival Aceh for help.

Lan Xang (The Land of a Million Elephants)—The Lao State in Southeast Asia

The Kingdom of Lan Xang (Land of a Million Elephants), established by Fa Ngum in 1353, ruled over the area that took in all of modern Laos, the northeast region of Thailand, and extended into parts of Vietnam and Cambodia. By 1707, extensive Vietnamese and Siamese intervention had forced an end to the united Kingdom of Lan Xang. The kingdom split into three competing kingdoms of Champasak, Luang Prabang, and Vientiane. The split, coupled with Siamese control over the kingdom toward the latter half of the eighteenth century and into the nineteenth century, effectively heralded the end of Lan Xang, whose descendants had enjoyed over 600 years on the throne. In its prime, the Kingdom of Lan Xang was considered to be one of Southeast Asia's largest kingdoms, whose army and military prowess were known throughout the region. The Kingdom of Lan Xang is believed to have been responsible for the flourishing of Lao culture and civilization, which up to this point had been theorized as being fragmented at best.

Fa Ngum (r. 1353–1373), the first ruler of the Kingdom of Lan Xang, established his capital in 1353 in Luang Prabang, which was well positioned with established trade routes passing directly through the city and created ongoing sources of revenue. Other sources of revenue came from the kingdom's taxation system whereby tribute was paid from the local rulers to the king. Volunteer labor was also used

at certain times for civic projects, such as the building of wats (Buddhist temples), walls, palace works, and other buildings; such payment in kind was popular and enabled the kingdom to expand without creating excess pressure on civic funding. Lan Xang's king enacted laws so as to unify the kingdom and provide socioeconomic and political stability and cohesiveness. Laws and their requisite punishments covered such things as murder, theft, and property damage; however, laws were not able to stem the frequent military incursions by rival kingdoms to the west (Burma and Thailand), to the south (Cambodia), and to the east (Vietnam), which occurred from the mid-sixteenth century.

Despite Lan Xang's reputation for being large and powerful, it was subject to enormous external and internal pressure. The constant threat of war placed excessive pressure on the military and affected the relative stability of the economic and social structure of the kingdom. The city of Viang Chan (made the capital of Lan Xang in 1560) fell under Burmese rule in 1574, and the kingdom became a vassal state from 1574 to 1587.

Internally, there had been mounting dissatisfaction with an authoritative monarchy. Religious rivalry was evident in Fa Ngum's first decade of rule, with trouble between different Buddhist sects (Mahayana, and Theravada worship) and animists during 1362–1368, overshadowing his expansionist ambitions. These problems persisted throughout the kingdom's history and contributed to a somewhat unstable monarchy. A particularly tumultuous period in 1428 saw no less than six kings losing their lives. The ongoing uncertain political stability decreased popular support for the apparently unstable monarchy. By the sixteenth century, Lao civilization had undergone a dramatic revision, and calls for a unified Lao identity became the norm, as did support for a stronger monarchy that increased particularly under the tutelage of King Phothisarath (r. 1520–1547) and King Setthathirath I.

The Kingdom of Lan Xang was primarily Theravada Buddhist; however, it also ascribed to animist beliefs prevalent due to the enormous amount of incorporated ethnic identities. Mahayana Buddhist practice surfaced during the

➤ WAT THAT LUANG (THE GREAT STUPA)

That Luang (the Great Stupa) was built by King Settathirat I in Vieng Chan in 1560–1566 when it became the capital of the kingdom. The Lao, many of whom are devout Buddhists, consider That Luang to be one of the country's most revered Buddhist sites. Many believe that That Luang was built on a religious site, as King Asoka, the great Indian king who converted to Buddhism, may have brought a Buddhist relic to the country during the third century and placed it in a stupa on the same site. Since its founding, That Luang remains a focal point of Lao religion, despite various unfortunate events throughout its lifespan.

That Luang is often viewed as a physical representation of Lan Xang's once-powerful status. It symbolizes a time when Laos was a united kingdom and provides a glimpse into its richly detailed past, as the Wat is over 147 feet (45 meters) tall and was originally covered in 24 karat gold leaf. Set out with three different levels, representing aspects of complex Buddhist philosophy, That Luang encouraged both contemplation and learning, and its religious and sociocultural importance was solidified through its use by royal families for official functions, festivals, and religious observance.

Following its construction, That Luang was the victim of rival aggressors who completely destroyed the Wat. The Burmese military and Chinese bandits also destroyed the complex, especially during the later half of the nineteenth century when Chinese Hui invaded Vientiane and overran the entire city. Much of what is standing today is the result of an intensive restoration effort led by a

Wat That Luang, a Buddhist temple in Vientiane, capital of Laos, built in 1566. (Mike Thomas)

—Samaya L.S. Chanthaphavong

earlier years of Lan Xang; however, Theravada became the prominent practice due to its affiliation with the monarchy. Animist beliefs such as *Phi* (spirits) and shamanist rites were commonly associated with village level religion. Buddhism provided social cohesion in the form of schooling (at wats by monks), at annual festivals, and in the form of hierarchical rule whereby people at the immediate village level were first able to consult directly with monks about their problems and, should the issue not be resolved, move to higher forms of justice. When animist beliefs

were coupled with Buddhist practices (such as spirit conversing, rites, etc.), the rulers of Lan Xang were able to appeal to a wide populace.

Contesting royal families and their ongoing sociopolitical and religious quarrels during the seventeenth century resulted in Lao civilization experiencing further restructuring. The years 1621 to 1633 witnessed succession disputes over the throne of Lan Xang, which signaled the beginning of the end. Despite an intense period of peace under King Surinyavongsa (r. 1633–1690), the once-strong kingdom, weakened by

persistent infighting and political stress, was divided into three kingdoms upon his death. The new kingdoms of Champasak (established in 1713 in southern Laos) and Luang Prabang (in northern Laos) claimed legitimacy of rule with the installation of their own monarchies and asserted their independence from Viang Chan. The kingdom of Lan Xang was now divided into three distinct ruling factions, microcosms of rule. The split resulted in weakened military structures so that in 1765 Luang Prabang was invaded by the Burmese army, which in addition to looting the city succeeded in bringing the area under its control. It is believed that tens of thousands of Lao people lost their lives until Siamese forces, under the military command of Taksin, were eventually able to drive out the Burmese at the cost of placing Luang Prabang under Siamese suzerainty.

Early British Empire Building in Asia

Elizabethan efforts to found an overseas empire largely came to naught. Twenty years after its creation by royal charter on New Year's Eve 1600, contemporaries would still have found it incredulous that the East India Company (EIC) would less than a century and a half later conquer a significant province of the Mughal empire. Such, however, was the demand for Eastern luxury goods—including spices, textiles, and latter tea—that had traditionally reached English markets via Portuguese ships that rounded the Cape of Good Hope or overland routes through the Levant, or eastern Mediterranean. Early English empire building, which centered

on the Muscovy, Levant, and East India companies, sought direct trade with the East in order to maximize commercial profits.

As early as 1553, some 200 English investors financed a voyage to Cathay via the Norwegian cape and the Barents Sea. Two years later, a royal charter granted the Muscovy Company a monopoly on all trade with Russia and all lands northward. When the Northeast Passage proved impassable, attention shifted toward reaching Cathay via Moscow, the Caspian Sea, and Central Asia. Warfare east of Bukhara in the late 1570s rendered this route impractical as well. Attention then turned to Persia, but the bulk of that country's trade flowed westward into the Levant, and developments in England rendered irrelevant the repeated efforts of the Muscovy Company to develop trade with Persia via Russia.

English merchants had abandoned trade in the eastern Mediterranean for several decades after 1550 because of the strength of the Ottoman Navy. However, developments in European international relations during the 1570s increasingly favored England and eventually led to the incorporation of another chartered trading company in 1581. The Levant Company would remain the most lucrative component of England's overseas trade until the 1620s but ultimately would not be able to compete with the EIC, as the latter eliminated all intermediaries by sailing around the Cape of Good Hope.

Although the embassy of Thomas Roe (1615–1619) secured the position of the EIC within the Mughal empire, the 1620s were a difficult period that dashed much of the hope that had surrounded the company at its founding. The Dutch fiercely resisted all attempts to break their control of the Indonesian pepper and spice trade. However, the focus of the EIC was slowly shifting toward Mughal India, specifically Surat in western India, Madras on the Coromandel Coast, and Bengal. It was not until the late eighteenth century that European textiles would rival Indian calicoes, which were popular with Europeans on both sides of the Atlantic. Nevertheless, the future of the EIC reminded shaky well into the 1660s. In the last decades of the seventeenth century, the calico trade expanded dramatically, as did the company's profits.

► THE BRITISH IN ORISSA, FROM THE MUGHALS THROUGH THE BATTLE OF BUXOR, 1764

Prior to 1765, when authority over the eastern wing of the Mughal empire was transferred to the East India Company (EIC), a single Mughal governor, or nawab, administered Bengal, Bihar, and Orissa. Successive nawabs increasingly ruled independent of the imperial center. Their usurpation encouraged others. The result was a decade-long war in the 1740s that saw Orissa lost to the Marathas; the British retook the province in 1803. In 1756, unlike the French, Dutch, and most Indian elites, the English balked at the traditional demands of the new nawab of Bengal, Siraj-ud-daula, for money. Siraj-ud-daula ordered Calcutta sacked in retaliation, though his exact objectives are unclear. British reinforcements sailed from

Madras under the command of Robert Clive, who at the 1757 Battle of Plassey defeated Siraj-ud-daula primarily by bribing his army to stand aside. Successive nawabs of Bengal, who were now clients of the EIC, were dismissed in 1760 and in 1763. In the case of the latter, Mir Kasim, the deposed nawab, rallied the Mughal emperor and the wazir of Oudh to his cause, but all three were decisively defeated at the Battle of Buxar. In addition to gaining the right to collect taxes, the EIC gained a new “ally,” the wazir of Oudh, who also was forced to accept a British garrison and most significantly established a bridgehead.

—Sean Kelly

In 1664 and 1670 the Marathas, a Hindu warrior caste from the Deccan plateau, sacked Surat. As cracks in Mughal authority spread, the Dutch, French, and English East India companies filled the gap. The EIC increasingly focused on Madras and Bengal. Both Fort St. George and Fort William, at Madras and Calcutta, respectively, were fortified, and over time European communities, along with segregated towns of Indian merchants and artisans under English protection, developed. By 1689, the EIC felt strong enough to challenge Mughal authority outright, though the war ended with the English paying reparations. Distracted by the Maratha insurgency throughout the 1690s, by the early 1700s the Mughals lacked the military resources to stem rising European influence.

At the outset of the eighteenth century, Europe's relationship with Asia remained largely unchanged from that of Roman times. It was a purely commercial enterprise, though the scale had increased dramatically. Historians continue to have a hard time explaining why, but the latter half of the eighteenth century proved transformative for the EIC. By 1744, the War of Austrian Succession had spread to the Indian Ocean. Two years later on behalf of autonomous regional allies, who pledged nominal loyalty to the Mughal emperor, the British and French East India companies were fighting over disputed territory in

southeastern India. Fighting continued until the British won a decisive victory in 1761. It was developments in Bengal, however, that led to the EIC obtaining the right under the Treaty of Alahabad (1765) to collect taxes in Bengal, Bihar, and Orissa on behalf of the Mughal emperor. Governing some 20 million Bengalis raised EIC revenues by several million pounds per annum, the annual tribute to the emperor being largely symbolic. In addition to tying the EIC closer to the British state, which itself would have profound consequences in the ensuing decades, Calcutta now rivaled Delhi, seat of the Mughal emperor, in influence. Dominance over all of India was still unimaginable, but by becoming a regional Indian power, the EIC assured itself of a future role in Indian politics.

Absolutism in Practice

The development of absolutism in western Europe in the seventeenth century, particularly in Bourbon France, was characterized by the gradual absorption of all political and economic power by the centralizing monarchy at the expense of the aristocracy. As the wars of religion ravaged much of Europe, monarchs in France, England, Spain, and the Holy Roman Empire sought to consolidate their power amid the religious civil wars (i.e., Thirty Years’ War and English Civil War) being fought against their respective subaltern aristocracies. While France was able to successfully consolidate the power of the Bourbon monarchy (particularly that of Louis XIV who reigned from 1661 to 1715), the monarchs of England, Spain, and the Holy Roman Empire found themselves either sharing power with their respective aristocracies or experiencing further political fragmentation.

In practice, absolutism was based on the centralizing authority of the monarchy, which claimed to derive its authority from God. The concept of the “divine right” of kings that was expressed forcefully by James I of England in 1609 was based not only on examples from the Christian Bible but also on legal and historical precedents. Nonetheless, the idea that the monarch reigned through divine legitimacy was motivated by the religious climate in post-Reformation Europe. Due to the endemic warfare and religious upheavals that had characterized the wars of religion of the late sixteenth and early seventeenth centuries, the centralizing monarchies of Europe found an opportunity to expand their authority at the expense of the quarrelsome aristocracy. For

example, Habsburg emperor Ferdinand II instigated the Thirty Years’ War (1618–1648) under the pretense of ousting Protestantism from his realms to expand royal authority throughout the politically fragile Holy Roman Empire that spanned Central Europe. The Stuart monarchy in England, represented by James I and his son Charles I, also sought to centralize the authority of the English Crown by ignoring the authority of Parliament, eventually prompting the English Civil War (1642–1649). In contrast, Louis XIV (1643–1715), the Sun king of France, was successful at displaying his grandeur as the divine representative of God on earth not only through his lavish displays of wealth and his ostentatious lifestyle but also through his royal authority, ensured throughout the French realm by his royal intendants (royal officials) and an extensive royal bureaucracy.

The first king of Great Britain (England and Scotland) and Ireland, King James I founded the ill-fated Stuart royal dynasty in the early seventeenth century. (Library of Congress)

The most successful example of absolutist regimes is that of Bourbon France, established over the course of a century through the work of the politically savvy Cardinal Armand Jean du Plessis de Richelieu (who served Louis XIII) and Cardinal Jules Mazarin and royal ministers Nicolas Fouquet and Jean-Baptiste Colbert (who all served Louis XIV). While the monarchies of England, Spain, and the Holy Roman Empire were unsuccessful in asserting their power vis-à-vis their aristocracies, the French Bourbons were particularly effective in restraining and limiting the power of their nobles. The use of intendants, who were responsible only to the monarch, served to infringe on aristocratic autonomy in France's many regions. Intendants, many of whom came from wealthy middle-class backgrounds, created a nobility of the robe loyal to the monarch but also paid for the privilege to serve as such, further adding to the state coffers. Cardinals Richelieu and Mazarin and royal ministers Fouquet and Colbert served their respective monarchs by asserting royal control through intendants but also by intriguing against potential power plays by the high nobility against the current king. In particular, Richelieu and Mazarin had to contend with the quarrelsome queen regents they served, who were often allied with high aristocracy against their own sons. Furthermore, these high officials also found ways to ensure revenue for the monarchy by encouraging the development of commerce, increased taxation, and efficient fiscal policies, utilizing the instruments of the state to these ends.

The fiscal instruments created by French absolutism fostered the expansion of the French economy through the stimulation of industry and the practice of mercantilism, which was tied to French foreign policy aims. By encouraging the development of trade within France and its American possessions, the monarchy was able to tap more sources of revenues to fund France's many wars against the Habsburgs. The expansion of French commercial strength in Europe and North America ensured rivalry with upstart England and the United Provinces (the Netherlands) while financing the many wars that Louis XIV fought against most of the European powers through much of the late seventeenth and early eighteenth centuries.

➤ KING JAMES I ON THE DIVINE RIGHT OF KINGS

In a speech before Parliament on March 21, 1609, James I expressed the clearest and perhaps most forceful assertion of the concept of kings' absolutist authority from God.

"The state of monarchy is the supremest thing upon earth. . . . Kings are justly called Gods, for that they exercise a manner or resemblance of divine power upon earth. For if you will consider the attributes to God, you shall see how they agree in the person of a king. God has power to create, or destroy, make, or unmake at his pleasure, to give life, or send death, to judge all, and to be judged nor accountable to none: to raise low things, and to make high things low at his pleasure, and to God are both soul and body due. And the like power have Kings; they make and unmake their subjects: they have power of raising, and casting down: of life, and of death: judges over all their subjects, and in all causes, and yet accountable to none but God only."

James Harvey Robinson, *Readings in European History* (Boston: Ginn, 1906), 2:219–220.

The lavish and ostentatious lifestyles of the monarchs in seventeenth-century Europe served as a symbol of their authority and divine right to rule their respective realms. The luxurious courts that were established also served to circumscribe the power of their aristocracies by keeping friends close and enemies closer. The palace of Versailles, established by Louis XIV of France, was characterized by rituals in which high nobility would serve the king on a daily basis in routines such as handing him a piece of clothing to ensuring that he had washed himself after using the bathroom. The Stuart court at St. James, while less extravagant than that of Versailles, was also an example of English monarchical wealth and exuberance. Both James I and Charles I surrounded themselves with court favorites and paramours to enjoy feasts, hunts, and outright debauchery, often causing outrage among their subjects. In Spain, the Habsburg

royal court in Madrid of Philip III, which was characterized by ongoing festivities, contrasted with that of his father Philip II's Escorial, a somber monastery outside of Madrid representative of that monarch's pious nature and fervent Catholicism.

Composite Kingdoms in Early Modern Europe

Early modern Europe was characterized by the ubiquitous existence of composite states or kingdoms that included more than one state under one ruler. Historian H. G. Koenigsberger put composite states into two major categories: those separated geographically (i.e., Spanish Habsburg realms) and those contiguous to each other (i.e., England, Scotland, and Wales). From 1450 to 1770 European composite kingdoms constituted the bulk of the political entities from the British Isles to the Polish plains. Composite states usually retained their distinctive linguistic, cultural, and ethnic characteristics that formed an integral part of their regional identity, which often put them at odds with what was interpreted as foreign rule, particularly when the ruling sovereign did not reside there or attempted to remove or constrict local privileges. While under the direct yet at times nominal rule of the sovereign, many of these composite kingdoms maintained differing levels of autonomy and regional representation. Moreover, in the late sixteenth century to the early eighteenth century, despite the attempts of many European monarchs to establish absolutist monarchies, many of their composite kingdoms managed to retain their historical rights and privileges vis-à-vis the sovereign.

In the early sixteenth century the Habsburg realms reached their greatest territorial expanse under the reign of Charles V as heir of the

Habsburgs of Austria, the Valois of Burgundy, the Trastámara of Castile, and the House of Aragon. As heir to the lands of Castile, Charles also possessed territories in the Americas, thereby illustrating the global dimensions of Habsburg rule. However, in spite of the accumulation of states and territories and his position of Holy Roman emperor, Charles had to contend with the myriad issues of ruling each state individually. The crown jewel of the Habsburg dominions, Spain, was divided into the kingdoms of Castile and Aragon with their own bureaucratic and representative institutions. In particular, Aragon's representative institution, the Cortes, retained a high level of control over the taxation and administration of the realm, over which the regional aristocracy held a tight rein to defend against possible intrusions of the monarch. Moreover, the Revolt of the Comuneros (1520–1521) in Castile was a rebellion by the “commons” against what was perceived regionally as foreign rule, as well as against increased taxation by the Crown. Given these and various other challenges, Charles divided his realms in 1556 between his brother Ferdinand I and his son Philip II, thus dividing the Habsburgs into the Austrian and Spanish ruling branches. Nonetheless, the wars of religion (the Habsburg-Dutch War and the Thirty Years' War) illustrated the complexity of ruling composite kingdoms for later Habsburgs in light of the effects of the Protestant Reformation and their attempts to create absolutist monarchies to replace composite rule. These religious and financial pressures caused the Dutch to revolt against Philip II in the late sixteenth century. The combination of the Dutch Revolt and the Thirty Years' War forced Philip III and Philip IV to begin levying taxes on all the kingdoms under their rule to Castile in order to help mitigate the cost of the wars. These perceived intrusions on historical rights and privileges caused the revolts of Catalonia and Portugal in 1640.

English acquisition of the kingdom of Wales in the eleventh century and its attempts to establish its hegemony over Scotland and Ireland in subsequent periods led to the development of a relationship with these realms as composite states. In this arrangement, Wales was

directly under the control of the English Crown, while Scotland and Ireland were able to maintain their sovereignty. However, Scotland and Ireland recognized their subservience to the English Crown while retaining their administrative structures largely untouched well into the fifteenth century. However, when James VI of Scotland inherited the throne of England in 1603 (becoming James I of England), both the Scottish and English realms came under the direct control of the Stuart dynasty. In spite of this development Scotland and England remained different, with their own representative institutions for the landed aristocracy, gentry, and burghers. James I's espousal of the concept of the divine right of monarchs put him at odds with both his Scottish and English subjects. His son Charles I would trigger the English Civil War in his attempts to circumvent the religious and political rights of his composite kingdoms. It was not until the Acts of Union of 1707 that the kingdoms of Scotland and England joined to form the United Kingdom of Great Britain, a unitary state, by virtue of uniting their parliaments and royal privy councils, thereby ceasing to be composite states.

The fragmented nature of the Holy Roman Empire created a patchwork of composite kingdoms, with sovereigns possessing multiple principalities, duchies, and kingdoms, among other polities, while remaining under the nominal, largely figurehead, rule of the Holy Roman emperor. In this arrangement, the emergence of the Kingdom of Austria (ruled by the Austrian Habsburgs after 1556) and the state of Brandenburg-Prussia (ruled by the Hohenzollern dynasty) illustrated the growth of these states amid the complexities of ruling composite realms. The Austrian Habsburgs held lands in Bohemia, Moravia, and Hungary, by virtue of possessing the crowns of those states, while having smaller holdings elsewhere. The Austrian attempts to centralize their control over the Holy Roman Empire culminated in the Thirty Years' War (1618–1648). After this dismal failure, the Austrian Habsburgs focused their attention on centralizing their control over their familial holdings in eastern and central Europe, through myriad arrangements with aristocrats

➤ CHARLES V AND HABSBURG COMPOSITE STATES

While Charles V ruled a multitude of composite kingdoms in Europe and territories in the Americas, these various political entities held differing levels of autonomy and regional representation, illustrating the limitations to power posed by composite states to the institution of monarchy. The following are Charles V's individual titles as ruler of each territory.

Holy Roman Emperor
 King of the Romans
 Archduke of Austria
 King of Castile and Leon (and its possessions in the Americas)
 King of Aragon and Sicily
 King of Naples
 Duke of Burgundy
 Duke of Brabant
 Duke of Limberg
 Duke of Lothier
 Duke of Luxemburg
 Duke of Guelders
 Margrave of Namur
 Count Palatine of Burgundy
 Count of Artois
 Count of Charolais
 Count of Flanders
 Count of Hainault
 Count of Holland
 Count of Zeeland
 Count of Zutphen

—Abraham O. Mendoza

in Hungary, Bohemia, and Moravia, while making Vienna the center of power. In spite of these attempts, these kingdoms retained various levels of administrative and aristocratic privileges and political autonomy while holding mutual allegiance to the Habsburg Crown. In contrast, Brandenburg-Prussia, particularly after the Thirty Years' War, exerted greater control over its disparate and contiguous territories, following an absolutist model of royal centralization of power at the expense of local autonomy, much like the Bourbons in France.

Russian Autocracy—Rise of the Tsars

One of the great success stories of the period 1450–1750 was the rise of a powerful Russian state. Prior to the fifteenth century, Russia had little political cohesion and was fragmented into dozens of small principalities that often feuded with each other. The Mongol conquest in the thirteenth century proved to be a turning point in Russian history. Besides the cultural and demographic catastrophe it produced, the some 250-year-long Mongol yoke also contributed to the birth of a stronger Russian state. The Duchy of Moscow played a central role in the Russian liberation efforts. Its rulers gained political experience and clout as tax collectors for the Mongols, gradually reduced the authority of other Russian princes, and expanded their own realm. Duke Ivan III (r. 1462–1505) of the Muscovite Rus, as this nucleus of the future Russian empire was known, did more than any other ruler (prior to the eighteenth century) to consolidate and strengthen the authority of Moscow’s rulers and lay the foundations for a centralized state. A shrewd and cunning statesman, he cultivated a friendly relationship with the Mongols as long as it suited his political interest. He overthrew Mongol domination in 1480; made Moscow’s last Russian rivals, Tver and Novgorod, bow to its overlordship; and set in motion the reconquest of the Ukrainian lands from Poland and Lithuania. His marriage to Sophia-Zoe Paleologue, the niece of the last Byzantine emperor, allowed him to claim the Byzantine empire’s legacy, be it in state imagery (e.g., two-headed eagle) or title (“tsar” derived from “caesar”).

Ivan’s policies of consolidation and expansion were continued by his successors. His grandson Ivan IV (r. 1533–1584), justly called the “Terrible” (although in this case “terrible” is used to describe power and might, not horror and cruelty), was instrumental in developing the Russian autocracy and expanding the boundaries of Muscovite Russia even farther. His conquest of Kazan and Astrakhan brought the Volga River under Russia’s control, gave Moscow access to foreign trade in the east, and opened eastern Eurasia to Russian exploration and empire building. But his most important legacy is in his domestic policies and the extended Livonian War (1558–1583). Historians still debate Ivan’s personality, some believing that he was mentally unbalanced and others arguing that he was a shrewd and pragmatic statesman. The first half of his reign saw a series of important reforms. In 1550 he adopted a new law code (*Sudebnik*) that curbed corruption and strengthened central authority. A year later he convened a church council (*Stoglavyy sobor*), which curbed clerical abuses and increased the tsar’s control over the church. He created the first permanent forces of musketeers (*streltsy*) and reorganized military obligations for nobles. Ivan then reformed the central government by creating chanceries (*prīkazny*), each dealing with a single area of government concern. In 1558 he launched one of the longest conflicts in Russian history by challenging Poland and Sweden in Livonia (the Baltic region). Despite some Russian victories, the war ultimately proved to be unsuccessful for Russia, and military setbacks had a profound impact on Ivan’s domestic policies. Indeed, throughout the war Ivan displayed progressively violent and suspicious behavior, suspecting the nobles (boyars) of plotting against him. Military failures during the Livonian War only increased his anger, and he blamed them on boyars and other officials. In the early 1560s he turned unforgiving toward his perceived enemies and resorted to arrests, banishments, and executions. By 1565 he created the infamous institution of secret police, the *Oprichnina*, to seek out “traitors” in Russian society. Dressed in black, riding black horses, and carrying their symbols of dog’s head and a broom (signifying the hounding and sweeping

of treason from Russia), these 6,000 strong “dark riders” spread terror throughout the state, killing thousands and brutally enforcing the tsar’s will. The Oprichnina also created a separate royal court and administration that ruled over half of Russia and drove the great nobles to the periphery known as *zemshchina*.

This state terrorism remains a difficult political phenomenon to explain. It certainly was the result of Ivan’s paranoid nature but also served his political goal of reducing the authority of the powerful hereditary nobility and strengthening the tsar’s rule. The Oprichnina carried on for eight long years and saw numerous abuses and atrocities. In 1570 Ivan, suspicious of the city of Novgorod’s loyalty, let his Oprichniki sack the city for days, killing 10,000–15,000 people and plundering this once wealthiest of the Russian cities. Ivan ended the Oprichnina in 1572, but its effects proved to be long-lasting. Besides the deserted villages and sacked towns, this policy greatly weakened the aristocracy who opposed the centralization of power in Russia.

But Russia’s aristocracy was not destroyed, and 20 years after Ivan’s death it tried to reassert itself. In 1598 Russia descended into the chaos of civil war following the death of the childless Tsar Fedor (r. 1584–1598) and his successor Boris Godunov (r. 1598–1605). For the next 15 years the country was in the midst of the Time of Troubles as various pretenders, supported by noble factions and foreign states, tried to ascend to the throne. At the same time, the volcanic explosion in South America affected climate throughout the world and resulted in the worst famine that Russia had experienced in centuries, killing tens of thousands of people during 1601–1604 and exacerbating political turmoil. Sweden and Poland exploited this tumult to attack Russian territory, while outlying Russian provinces broke away from the central government. But foreign intervention also incited a national liberation movement that drove the foreigners out of Russia. In 1613 the Assembly of the Land, which included representatives of social estates, chose a member of the Romanov family as the new tsar. This was the beginning of the Romanov dynasty that was to rule Russia for the next 300 years.

➤ LETTER FROM IVAN THE TERRIBLE TO QUEEN ELIZABETH I

In 1570 Ivan the Terrible wrote a letter to Queen Elizabeth I of England that clearly illustrates his autocratic personality.

“And how many letters have been brought to us here [from England] . . . but every letter had had a contrary seal, which is inappropriate, and such letters in all places are not credited, but every prince in his realm has one proper seal; but we acknowledged these letters [nevertheless]. . . . And after that we had news that a subject of yours had come to [Russia] by name Edward Goodman . . . and [we] commanded him to be searched for letters and we found many letters; and in those letters were written words not allowable against our princely state and empire, how that in our empire were many unlawful things done. . . .

And we had thought that you are the sovereign in your domain, and rule alone, and seek your sovereign honor and your country’s profit, and therefore we wished to deal with you. But now we perceived that beside you there are men who rile, and not men but low class traders, who look not to our sovereign heads, honor, and profits, but seek their own trading profits. And you abide in your maidenly state like a commoner.”

Council of the Indies, Viceroy, and *Audiencias*

The exploration and conquest of the vast territory ruled by the Spanish Empire after Columbus's voyages was achieved primarily through individual enterprise with little help from the Crown. Monarchs had initially promised the conquistadors extraordinary financial and political rewards. However, by the early sixteenth century Queen Isabella and her successors sought to regain control of the newly discovered territories. The Council of Indies, the *audiencias*, and the viceroyalties were key institutions aimed at establishing the Crown's political power in the New World. The Consejo de Indias was an advisory council endowed with legislative, administrative, and judicial powers over the colonies in America and the Philippines as well. From its seat in Spain, the Consejo also ruled on military and religious matters. This powerful

agency, however, emerged only gradually and in a rather unplanned manner. In 1493 following Columbus's first voyage, Isabella entrusted the administration of the newly discovered territories to her trusted aide, Bishop Juan Rodríguez de Fonseca. Over the years, other advisers and civil servants came to assist Fonseca in what became an informal agency managing Spain's colonial empire. The first references to the council as a separate agency appeared only after Fonseca's death in 1524, and its statutes were not put into writing until 1542 as part of the New Laws of Charles V. By then, the Consejo de Indias was one of the highest-ranking institutions in Spain, second only to the Council of Castile and reporting directly to the king. It included more than 20 members and was presided over by a chancellor and his deputy.

During the seventeenth century membership in the Consejo was used as a form of patronage and political reward, turning it into a large and expensive body. The attempts undertaken in the eighteenth century to make the council smaller and more nimble failed.

The *audiencia* was another agency developed early on as part of the Spanish Crown's attempt to curb political autonomy in the colonial world. *Audiencias* existed in Spain but only as judicial courts. In America, however, they had broader powers, including administrative responsibilities that coexisted with and even limited the political power enjoyed by local executive officials. As such, the *audiencias* were also entrusted with keeping governors from overstepping their bounds as well as maintaining the rule of law in the colonial world.

Ferdinand I ordered the establishment of the first *audiencia* in Santo Domingo in 1511, and the Spaniards then set up one of these courts in each important city. While the *audiencias* in larger colonial cities and towns included numerous members, usually up to a dozen or more, smaller ones had only a few members and struggled to keep up to date with their business. Nonetheless, as a key institution of colonial America, the *audiencias* created long-lasting institutional customs that shaped the political world of the continent after the independence of Spanish America.

Antonio de Mendoza was the first viceroy of New Spain, serving during 1535–1550. (Scala/Art Resource, NY)

GOVERNMENT IN COLONIAL SPANISH AMERICA

Instrucción para . . . contestar el Juicio de Residencia que debo dar de los empleos de Gobernador y Capitán General . . . by Juan Manuel Fernández Campero.

The representatives of the king in the New World, the viceroys enjoyed great power but also demanding responsibilities. A complex political and administrative system limited their influence and authority, forcing them to engage in constant political maneuvering and negotiation. Complaints against their rule could be brought forward during the *juicio de residencia*, the hearing that regulated the offices of all royal administrators in Colonial Spanish America.

“Not even the best governor can keep everybody happy and he would be very good if he could please half of his subjects. I took office in this city [Cordoba] in 1764. . . . In time of plague, the year 1766 I alleviated what I could of the people’s needs, providing them a physician, which they lacked, calling on the most miserable in their homes, bringing them food from my own table, and contributing to their shrouds and funerals. . . .

My efforts were public and notorious and nobody can deny that I administered for everybody in a disinterested manner. . . . I visited all the forts and frontiers in my province in a conspicuous manner. I maintained good relations with the people in the city and checked on public prisons several times. I cared for the widows and minors as much as I could as can be testified by Doña Lorenza de la Camara and Doña Juana Gallo. I strove for ecclesiastical judges and priests to be treated with respect. I bequeathed a red and yellow silk drapery to the presbytery in the Cathedral’s main chapel from my own assets. In this city dominates the party spirit and stubbornness of a few Europeans . . . who, resenting some of my government’s decisions . . . started . . . to making parties, ties and alliances to get revenge and make me disliked by the Viceroy and the Royal Audiencia.”

Graciela Meronoi, *La Historia en Mis Documentos* (Buenos Aires: Editorial Huemul, 1979).

The first half of the sixteenth century saw the emergence of the viceroyalty, another political institution that was to persist as a key element of the Spanish empire in the Americas. The viceroy was considered the direct agent of the king in the colony and thus enjoyed the highest administrative, military, and juridical authority. Yet because viceroys were compelled to work in concert with *audiencias*, their power was not absolute. The viceroy also served as the president of the royal *audiencia* in the capital city. He appointed other officers in the jurisdiction, and among his main duties was the defense of the territory. He was also to improve the viceroyalty’s economy and look after the indigenous people. To this end, the Crown ordered the viceroys to dedicate much of their time and efforts to address the Indians’ needs.

The first viceroy appointed to the mainland was Antonio de Mendoza, an experienced administrator who set the mold for future viceroys

during his reign over New Spain between 1536 and 1550. This viceroyalty included all territories in the Western Hemisphere north of Panama. The second in the Americas, the viceroyalty of Peru, was established in 1544. It covered all of South America with the sole exception of the northern Caribbean coast and Brazil, a Portuguese colony. The capitals were the cities of Mexico and Lima, respectively. To make their administration more manageable, the two viceroyalties were divided into smaller units ruled by a president, a captain-general, or a governor. The viceroyalties of New Spain and Peru were the largest political entities in the Americas until the eighteenth century, when the viceroyalties of New Granada (incorporating Colombia, Ecuador, Panama, and Venezuela) and Rio de la Plata (including Argentina, Bolivia, Paraguay, and Uruguay) were created under the rule of Bourbon kings, who introduced deep reforms.

Corregidor Rule and Native Response

In the sixteenth century, the Spanish instituted a system of rule by local magistrates (public officials) to govern their far-flung empire. Three terms were used to describe the magistrates: *corregidor*, *alcalde mayor*, and *gobernador*. The *gobernador* and the *alcalde mayor* were governors of a province and could have other local magistrates under them. The term “*alcalde mayor*” (major judge) stood in contrast to the *alcaldes ordinarios* (ordinary judges) of cities and towns. The *corregidor* (one who corrects), originally began as an office used by Ferdinand and Isabella (the monarchs who were patrons of Christopher Columbus) in order to gain more royal control over the Castilian municipalities in Spain. When extended to the Americas, *corregidores* exercised roughly the same powers as the other types of local magistrate but might be

subject to the authority of a *gobernador* or *alcalde mayor*.

The *corregidor* collected royal taxes in the district, dealt with criminal law, maintained order, and supervised various labor drafts and other programs organizing native labor. They were in part judicial positions, but since they were seldom lawyers, all decisions were subject to approval by the court of appeals, the *audiencia*. The magistrate had a large degree of coercive power. The *corregidor* also provided some royal supervision over the *encomienda* and later over the regulation of the supply of native labor, the *repartimiento*. As the *encomienda* grants eventually passed to the Crown, those districts too fell under the jurisdiction of the *corregidor*. The districts of the *corregidores* frequently corresponded to native territorial boundaries. Beyond this, the institution was imported fairly faithfully from Spain with few modifications.

All local magistrates, regardless of their title, served at the pleasure of the Crown. Magistrates in the important towns and provinces of the empire usually received their appointments directly from the Crown. All others were appointed by local officials, either the viceroy or the local royal tribunal, the *audiencia*. While early in the colonial era nearly all of the magistrates were Spaniards born in Spain, called *peninsulares*, by the end of the sixteenth century nearly all were Spaniards born in the New World, called *criollos*. The magistrates served fixed terms of office, usually two to five years, and would frequently

➤ BUYING AND SELLING OFFICE—IMPERIAL SPAIN

In the fifteenth century, Juan II of Spain (1405–1454) began a program of selling municipal offices in order to gain funds for the royal treasury. This practice declined during the reign of Ferdinand and Isabella as they attempted to gain more royal control but gained momentum again during the reign of Philip III (1578–1621) when the Crown was in serious need of money. Originally, the offices included only secretarial positions, such as scribes and notaries. Since the minimum qualification was knowledge of how to read and write, many people qualified. In order to determine who might best

serve the office, the Crown accepted bids, in part based on the revenues of the office. Later this practice was expanded to include seats on town councils where the prestige of office was high, the power limited, and the income nominal. Later, local magistrates were included, and finally in the mid-seventeenth century, seats on the royal courts of law, the *audiencia*, were sold. Scholars have suggested that except for ecclesiastical offices, every position in the colonial bureaucracy had been sold at least once, including that of viceroy.

—John Schwaller

be assigned to a new district at the end of their term. They were subject to a review of their government at the end of their appointment, called a *residencia*, a period during which they resided in the district and were investigated by their successor for malfeasance and other illegal acts.

By the seventeenth century, the Crown began to sell the offices at public auction. In order to win the office at auction, the magistrates made contracts to borrow money from merchants. Once in office, they then needed to pursue tactics to gain enough money to repay the loan. Through this, abuses such as the forced sale of goods became endemic to the system. A forced sale meant that a magistrate acquired goods from a merchant. The magistrate in turn forced the natives of his district to purchase the goods at inflated prices or face imprisonment. Magistrates might also coerce natives into labor contracts with local landowners.

The natives nevertheless had some recourse to justice in spite of the magistrates. Special courts were established in the important capitals just to hear cases coming from Indians. The *residencia* was also a time when complaints could be lodged against magistrates. Natives could also enlist the assistance of local priests and missionaries to oppose a magistrate, since in many regions the magistrate and the priest were the only Spaniards. Even if a rebellion occurred in which a corregidor might be killed, the priest would only be threatened or, at most, roughed up.

■ Introduction: Innovations in Political Thought

To understand the foundations of modern political thought we must venture back to twelfth-century Italy, where the Italian city-republics experimented with self-government. These practices provided numerous juridical, rhetorical, and philosophical reflections that eventually contributed to the emergence of modern political thought. Chief among these was the idea of liberty that centered on the independence of a given city and its republican self-government. Such ideas were elaborated and defended in the works of the first civic humanists of the early Renaissance, such as in the writings of Brunetto Latini and Albertino Mussato. Yet one scholar holds particular place in this long line of humanists. Niccolò Machiavelli (1469–1527), a Florentine diplomat and political philosopher, authored one of the most famous and influential political treatises, *The Prince*, in 1513, although it was not published until five years after Machiavelli's death. Infamous for its embrace of expediency in politics, the treatise attracted generations of statesmen, laying a foundation for political realism and sec-

ular power politics and turning its author's surname into a political term (Machiavellianism) for deceitful politics. Yet, Machiavelli's other works are no less interesting, chief among them his *Discourses on Livy* which, by analyzing the early history of Rome, also enumerated the elements of a republican state, including the concept of checks and balances.

Machiavelli's contemporary, Thomas More (1478–1535), in his famous *Utopia* (which means “nowhere”) described an ideal society and government as its author envisioned it. More's political vision blended Christian beliefs with traditional hierarchies and ideas of social equality and freedom. Yet, More believed that spiritual authority, based on Scripture, always superseded the temporal. Meanwhile, in France, the writings of Jean Bodin (1529–1596) supported the absolutist authority of French kings. In his influential book *The Six Books of a Commonwealth* (1576), he argued that the monarchy had absolute sovereignty within a state. Acknowledging different forms of government, Bodin observed that a “just” government of any form was acceptable

as long as it served the common good; yet, suspicious of the common peoples' motivations, he denounced democratic governments. In Spain, Francisco Suárez (1548–1617) drew heavily on Christian political thought, especially that of St. Thomas Aquinas, while writing his book *A Treatise on the Laws and God the Lawgiver* (1612). Suárez sought to integrate Christian beliefs into political theory. According to him, a monarch possessed the absolute sovereignty to make laws in conformity with divine and natural law. Like Bodin, he believed that a sovereign is not subject to the law, but rather is the law itself; while he ruled in the interest of the people, the sovereign did not require their consent and the people did not have a right to replace their rulers (unless the ruler was a Protestant or sought to destroy a Christian community).

The seventeenth century included a number of important political theorists. Court preceptor to Louis XIV of France, Bishop Jacques-Bénigne Bossuet was a strong advocate of political absolutism. He used Scriptures to support his arguments in favor of the divine authority of kings, arguing that a royal government expressed the will of God, was therefore divinely blessed and sacred, and that any rebellion against it was criminal and aberrant. A sovereign, Bossuet believed, was to behave as God's image, and govern his subjects as a good father. In England, Bossuet's ideas were shared by Sir Robert Filmer who, in his major work *Patriarcha* (1680), proposed that the state was a family and the king a patriarch. Adam was the first king, Filmer argued, and the English kings ruled the country as Adam's eldest heirs.

Unlike Suárez and Bossuet, the Dutch jurist and political philosopher Hugo Grotius (1583–1645) embraced the idea of natural rights and laid the foundation for liberal civil society and a government based on social contract. These concepts, however, were better elaborated in the works of English political theorists. Sir Francis Bacon (1561–1626) sought to incorporate science into government. In his book *New Atlantis* (1627), he made a case that government's reliance on science and technology would lead to political and military power and prestige, coining the famous phrase "Knowledge is Power." In his treatise *The Commonwealth of Oceana*

(1656), James Harrington (1611–1677) agreed with Aristotle's notion of economically independent citizens as virtuous rulers and categorized governments based on economic factors. A supporter of republicanism, he believed that a republican system was dependent on the existence of a strong middle class while the separation of economic and political power inevitably led to a political revolution. Unlike Harrington, Thomas Hobbes, in his influential work *Leviathan* (1651), championed the idea of a strong government capable of maintaining strict order and protecting its subjects. Hobbes maintained a dark view of human nature and mankind's selfish appetites which the government had to control. He argued that royal power came not from a divine right but rather from a 'social contract,' an unwritten agreement among the early people by which they agreed to give up their individual liberties for political order and stability delivered by a ruler. Hobbes believed in the absolute power of the monarch, declaring "nothing the sovereign representative can do to a subject, on what pretence soever, can properly be called injustice or injury." Hobbes's ideas inspired another English philosopher John Locke to write his famous *Second Treatise on Government* in 1690. Locke shared Hobbes's belief in a 'social contract' but he also contended that the king's authority should be limited by the very contract that carried the people's consent to be ruled. If the government misused or overreached its authority, then the people had the right to withdraw their consent and terminate the agreement. In his *Treaties on Government*, Locke explicitly stated the people's right of revolution to oppose unjust rule and overthrow authority.

In Germany, Samuel Pufendorf (1632–1694) tried to reconcile both Hobbesian and Lockian views. He agreed with Hobbes about the nature of humans being characterized by weakness, self-interest, and self-preservation which led to the conclusion of a social contract. Pufendorf, however, also believed that all individuals were entitled to rights of equality and freedom, while governments were responsible for maintaining safety by enforcing civil laws and protecting natural rights.

During the Enlightenment period, new political theories emerged as *philosophes* such

as Jean-Jacques Rousseau, and Charles-Louis de Secondat, baron de Montesquieu joined the political debate initiated by Locke and Hobbes. These theorists pondered fundamental questions on the origins of state and the relations between the state and the people. Montesquieu, most famous for his book *The Spirit of the Laws* (1748), admired the British constitution of a limited monarchy and called for the separation of governmental powers and adoption of the system of checks and balances. He favored a republican government which, he believed, encouraged the virtues of equality, democracy, and patriotism in its citizens but he also claimed that a republic could not exist in a territorially vast country. He took an anthropological approach to politics noting that a country's customs, religion, climate, and economy greatly affect its politics. Arguably the most influential of the *philosophes*, Jean-Jacques Rousseau (1712–1778) accepted John Locke's view of human nature but specified that humans were kind, caring, and sympathetic only in their natural state while civil society corrupted them by instilling vanity, pride, and other vices. He championed a republican government with popular sovereignty, insisting that every citizen must participate in governance and each must give up his/her rights to the whole community. He famously declared that “freedom is obedience to laws one has prescribed to oneself,” arguing that individuals should be subsumed by the “general will” or common good. Any civil disobedience to the general will would be considered a subversion of the common good and the dissenter could justly be punished or executed. Thus, to many political observers, this notion of a general will underlay much of the violence of the terror during the French Revolution and, in later years, the totalitarian regimes of the twentieth century.

—Alexander Mikaberidze

Niccolò Machiavelli

Niccolò Machiavelli (1469–1527) was an Italian historian, statesman, and political philosopher. His political theory, as presented in his works *The Prince* (1532) and *The Discourses* (1534), has turned his name into a synonym

for amoral deception and cunning in pursuing one's goals.

Machiavelli was born in Florence on May 3, 1469. He began his influential career in politics when he became a clerk for the newly proclaimed Florentine Republic in 1498. In the new republic Machiavelli served as secretary of the ten-man council that conducted diplomatic negotiations and supervised the military operations of the republic. Machiavelli's duties included, among other things, missions to the French king (1504, 1510–1511), the Holy See (1506), and the German emperor (1507–1508). While Machiavelli was involved with these diplomatic missions, he became acquainted with many rulers and was able to study the methods they used in governing. The most significant such ruler whom Machiavelli studied was Cesare Borgia.

In 1512 when the Medici, a Florentine family, regained power in Florence and the republic was dissolved, Machiavelli was removed from office, and the Medicis temporarily arrested him for allegedly conspiring against them. Once he was released from prison, Machiavelli spent much of the rest of his life on his estate near Florence. It was during this period that he wrote his most important works, including *The Prince* (published in 1532) and *The Discourses* (published in 1534). Machiavelli was never able to curry political favor with the Medicis, and consequently he never regained his former prominent place in the political life of Florence. To make matters worse, when the Florentine Republic was temporarily reinstated in 1527, Machiavelli was suspected of being too closely allied with the Medicis to regain his former post. On June 21 of the same year, Machiavelli died in Florence.

Machiavelli is considered by many to be the father of modern political theory. In his book *The Prince* he argued that a ruler is justified in using whatever means necessary to secure power. A ruler should not be too tyrannical, for this might enflame the hatred of the governed. Yet the ruler should not seek to be too kind or beneficent, for without fearing the prince, the governed may pursue selfish ends that are ultimately to the detriment of the state and the prince. Within these parameters, however, Machiavelli claimed that the most successful rulers

(rulers he studied while on diplomatic missions) were those who could, through deception and cunning, foster the love, respect, and fear of the citizens. Some have interpreted *The Prince* to be a satire that should be read as a critique of absolutist rulers such as the Borgias. This reading would emphasize the importance of liberty and the role of government in protecting the liberties and rights of its citizens, hence the reason that Machiavelli is often cited as the initiator of modern political theory, for much of modern political theory is concerned precisely with detailing the manner in which a government or ruler is legitimate only if the government or ruler protects the rights and liberties of the governed. However, this reading of Machiavelli fell largely into doubt in 1810 when a letter by Machiavelli was discovered in which he reveals that he wrote *The Prince* to endear himself to the ruling Medici family of Florence. Read in light of this letter, *The Prince* emerges as a justification for strong governments, even absolutist if necessary, as a means of reducing the influence and threat of foreign powers.

Although Machiavelli's name has become a pejorative term, these associations should not lead one to minimize the importance of Machiavelli as a political theorist. Regardless of the motives that led him to write *The Prince*, many of Machiavelli's observations and analyses of political tactics, the role that chance plays in restricting political policy, and many other points stand on their own as important contributions to the theoretical study of political strategy and tactics. Machiavelli is also an important figure in the resurgence of humanism and the Italian Renaissance. Since Machiavelli's time, political theorists have turned their attention to the human condition, to human nature, and to structuring a government that is based on conclusions regarding these issues; Hobbes is a case in point. This is in direct contrast to the ancient and medieval tradition of imposing an ideal form on human beings and molding and raising people who are best accommodated to this form. It is this turn to humanism in political theory that is perhaps Machiavelli's greatest contribution to Western culture.

Thomas Hobbes and Political Thought

The English philosopher and mechanist scientist Thomas Hobbes (1588–1679) is considered to be one of the forerunners of modern political theory because he was both the first to focus on the role of the individual and the first to espouse the idea of the social contract. Hobbes's profound conservatism, and in particular his espousal in the *Leviathan* of an all-powerful government, inspired John Locke to produce his own works of political theory in opposition to Hobbes. Hobbes can rightly be said to be the first philosopher to focus on the role of the individual vis-à-vis the state. Ancient philosophers typically focused on the role of the state (or polis), the church, royalty, or the rule of law. Hobbes's unit of analysis, though, is the individual citizen. This is often used as the demarcation point between ancient and modern political philosophy. Whereas ancient political thinkers viewed governments as divinely ordained or, in the Greek tradition, the ultimate good that people must serve, Hobbes defined government as existing to serve the people. He believed that the existence of government rested on the social contract: the tacit consent among the people to trade the freedom of the "state of nature" for the security ensured by government.

Although the social contract is widely seen as the theoretical underpinning of democracy, as in the U.S. constitutional notion of a government of the people, by the people, and for the people, Hobbes never envisioned a democracy. Rather, he called for an authoritarian monarchy to control the very people whom the government sought to protect. Because Hobbes

believed man to be inherently evil, he believed that in the absence of a powerful government, society would degenerate into “war of every one against every one.”

This is where Hobbesian conservatism really began to show. Hobbes believed that rational men would sacrifice liberty in order to secure the protection that a strong government would afford. Conversely, Locke believed that government could be limited to that which is necessary to secure life, liberty, and property. Locke would later add to the social contract a key component: the right of the people to resist the government, its ultimate exposition being the right to revolution. This would ensure that the people were always stronger than the government and was based upon a notion of the inherent goodness of man. Yet Hobbes could surprise the reader. In fact, his conservatism was based on an underlying egalitarianism that was rare for his time period. He believed that the strong government was necessitated by the inherent equality of all men, as seen in the following passage: “From this equality of ability, ariseth equality of hope in the attaining of our ends. And therefore if any two men desire the same thing, which nevertheless they cannot both enjoy, they become enemies.”

Just how strong the government was to be is made clear by the title of Hobbes’s seminal work, *Leviathan*. A leviathan is a biblical sea monster of mythical proportions. Of course, Hobbes’s leviathan was the government. In other words, it is better that one suffer under an authoritarian monster than be subject to the terrible freedom of being left to fend for oneself. Nevertheless, despite the overwhelming strength of the leviathan, there was one thing that it could not require of a citizen. It could not unjustly require of a man his life, because this would be a violation of self-preservation and would be placing the individual essentially right back into the feared chaotic state of nature. Just causes, though, such as military service and a trial and sentencing were allowed because they served the betterment of the leviathan. This, then, would help the self-preservation of many others.

Subsequent critics have challenged various aspects of Hobbesian thought. Of course,

scholars now question his use of American Indians as his primary example of the chaotic state of nature, as it is based on dubious assumptions. Other scholars have challenged his definition of the social contract. David Gauthier, for instance, notes that individuals who are wholly focused on self-preservation would not give up their rights to a completely sovereign king who might require them to die in combat. He proposes the notion of an “alienation social contract” whereby there is either limited sovereignty or the “citizens merely loan their rights to the sovereign” but can take them back. This allows for the right to revolution if self-preservation is being violated but still allows for an authoritarian government if the citizens remain motivated, as in Hobbes’s view, by fear of the state of nature, where life will be “nasty, brutish, and short.”

In conclusion, Hobbes had the honor of accomplishing many firsts in political philosophy. He was one of the first authors to focus on the role of the individual, thus making him one of the very first authors of modern political theory. He was the first author to create and define the notion of a social contract, something that we take for granted today. He was far ahead of his time in thinking that all men were inherently equal. And yet from these egalitarian beginnings he is now known as one of the fathers of conservatism because he believed that men were inherently evil and that they must be controlled by an authoritarian government. He documents this necessity in his most famous work, the *Leviathan*.

John Locke and Enlightenment Political Thought

John Locke (1632–1704) was one of the figureheads of the Enlightenment and is widely considered to be the founding theorist of liberalism. Like many other Enlightenment thinkers, Locke's scholarly interests spanned considerable breadth. He was an active contributor to Enlightenment philosophy, education, and medicine, and the impact of his political thought was immense and far reaching. Locke's ideas about political liberty and the right of revolution were at the core of much European and British eighteenth-century political philosophy, especially as the field was developed by writers of the Scottish Enlightenment. In addition, Locke's political thought was demonstrably influential in America, particularly in the decades leading up to the American Revolution. But even more than this, one might say that Locke's writings and the consequences to be drawn from them became synthesized and deeply imbedded in Enlightenment political thought.

Locke was born in Wrington, England, and educated at Westminster School and Christ Church, Oxford, graduating with a BA in 1656 and an MA in 1658. He would later enter medical school and was elected a member of the Royal Society in 1668. For several years he served as both medical adviser and private secretary to the prominent political leader Anthony Ashley Cooper (later the 1st Earl of Shaftesbury), but Locke's true vocation was writing. Locke addressed topics in a wide variety of fields, including economics, education, medicine, and religion in addition to philosophy and politics. His most important books related to political theory were *An Essay Concerning Human Understanding* (1690), *Two Treatises of Government* (1690), and *A Letter Concerning Toleration* (1698). All three were published in the aftermath of England's Glorious Revolution of 1688–1689, a revolution that aimed to limit the power of the Crown and resulted in

the fall of King James II and the succession of the co-monarchs William III and Mary II.

Locke's *An Essay Concerning Human Understanding* aimed to delineate the extent and limits of human knowledge. He argued, in opposition to the French philosopher René Descartes, that ideas were not innate to the human mind but that the mind was a blank slate that acquired ideas as the product of sensory experience, which was not always accurate. Locke's *Essay* quickly became standard reading and a commonplace staple of English thought, and it is difficult to overemphasize the impact of Lockean empiricism on the Anglo-American intellectual world by the middle of the eighteenth century.

Locke's epistemological foundation helps to explain his *Two Treatises of Government*. Published anonymously, *Two Treatises* appears largely to have been overlooked for the first ten years after its publication. Its slowly rising reputation might be dated to the early eighteenth century in the hands of popular British authors, such as Daniel Defoe, who wrote against parliamentary supremacy. Arguing against the divine right of kings espoused by the seventeenth-century royalist author Sir Robert Filmer, Locke maintained that in the precivil state, or the "state of nature" as he called it, men had certain natural rights. Among these natural rights were life, liberty, and property. While Thomas Hobbes had argued in *Leviathan* (1651) that the state of nature was a perpetual "war of all against all," Locke reasoned that in the state of nature all men would instead aim "to preserve the rest of mankind." Moreover, on entering a civil state, man's natural rights were not rescinded. Locke reasoned that if the rulers of any state made it impossible for its citizens to enjoy their natural rights, the people had a right to revolt against their leaders.

As such, Locke's *Second Treatise* became an important intellectual foundation for American colonists seeking to justify and encourage revolution. Locke's *Second Treatise* was not published in America until 1773, but it had been widely available to American readers decades earlier, as its presence in surviving book catalogues and other references in print shows clearly. James Otis famously quoted from Locke in his *The Rights of the British Colonies Asserted and*

Proved (1764), as did Nathaniel Ames in 1765. Locke was also cited in some of the most important political pamphlets of the day, such as Richard Bland's *An Inquiry into the Rights of the British Colonies* (1766) and Samuel Adams's *A State of the Rights of the Colonists* (1772). And as numerous scholars have shown, when in 1776 Thomas Jefferson spoke of "inalienable rights" in the preamble to the Declaration of Independence, he clearly owed a considerable debt to Locke, as Jefferson did on the topic of religious freedom. In his *Letter Concerning Toleration* (1698), Locke had argued that religion was a matter to be decided by individuals (although for this English Protestant, full toleration did not include Roman Catholics or atheists). Locke argued that churches ought to be voluntary associations, thereby partially setting the stage for the doctrine of the separation of church and state later incorporated into the U.S. Constitution and a mainstay of the modern liberal democratic thought. For instance, Locke's impact might be traced in the development of political thought in eighteenth-century France. There thinkers of the French Enlightenment, such as Voltaire and Montesquieu, championed English government and notions of religious toleration, in part as they understood these through their reading of Locke's *Two Treatises of Government*.

The Enlightenment and Political Philosophy

Ideas associated with the Enlightenment—secularism and anticlericalism, turning a skeptical eye toward tradition and custom in favor of the application of reason and expertise to public affairs and to a lesser extent democracy—played a prominent role in the history of political thought in the eighteenth century and later.

The Enlightenment completed the secularization of European political philosophy. For Enlightenment philosophers, rulers did not get their authority from God, as Christian political thinkers had asserted. Authority had to be justified in other ways, such as the consent of the people or the ruler's capacity to rule for the benefit of all, a benefit defined in terms of earthly prosperity rather than eternal salvation. Much of this theory derived from the English Revolution of the mid-seventeenth century and the "contractual" political thought of Thomas Hobbes and John Locke, who probably had more influence on mainstream Enlightenment political thinking than any other philosophers. The theory of a social contract was most fully developed in the Enlightenment by Genevan philosopher Jean-Jacques Rousseau. Rousseau's *The Social Contract* (1762) put forth a democratic theory of authority. Rousseau's contract was between equal individuals, not, like Hobbes's and Locke's, between the people and a sovereign. Rousseau's ideal society was based on equality of rights among its citizens (although Rousseau strongly distinguished between the rights and functions of men and women) and obedience to "the general will," which was not always the will of the majority.

► HENRY LLOYD ON TOLERATION AND THE ENGLISH CONSTITUTION

The English political and military writer Henry Lloyd considered England's free constitution indissolubly linked to its practice of religious toleration. In *An Essay on the English Constitution* (1870), he explains that tolerating a diverse range of opinions was not merely a necessary evil to avoid persecutions and civil wars but instead was a positive good.

"Toleration is a necessary consequence of civil liberty, and I shall always consider it as one of the greatest advantages of the English government; freedom of opinion is inseparable from civil liberty, inasmuch that when I see a prince endeavour to establish a unity in religion, I conclude he means to enslave his subjects, because the one leads to the other. It is on this principle that all Roman Catholic princes, who are more or less despotic, have proscribed all other species of religion, as much as in them lays. In a free government, the legislative power must never interfere with men's opinions, philosophical or religious. Their actions alone are subject to the laws. It is useful there should be a variety of opinions, and none should be excluded, but such as embrace tenets contrary to the principles of a free government. Even these must be treated with lenity. A variety of opinions always produces an emulation favorable to good morals."

The secularization of political philosophy went along with a suspicion of any involvement of church and state. Although not all Enlightenment philosophers went all the way to advocate a fully secular state, all distrusted the political power of the clergy. China, idealized as a place governed by wise magistrates who had marginalized the priesthood, was often put forth as a model in this regard. Religious domination was not only wrong and unjustified in that it stifled human freedom, but it also held back economic development. A favorite example of many French

Enlightenment philosophers was Louis XIV's expulsion of the Huguenots (French Protestants) from France in 1685, which some argued had been an economic catastrophe, depriving the country of many skilled workers.

The idea of political and social power as justified by tradition also found little favor among the Enlightened. Eighteenth-century Europe was a complex structure of groups and classes claiming privileges on the basis of custom and tradition. The nobility possessed many social and legal privileges, and even the vaunted British Parliament was elected on a crazy quilt of franchises based on historic traditions rather than on abstract political logic. Enlightenment philosophers, many of whom came from the middle class, attacked local traditions and privileges in the name of the universal values of reason and justice. They pointed out the fundamental irrationality of a system that distributed essential responsibilities on the basis of birth rather than ability. Enlightenment philosophers even approved of some revolutions, including the English Revolution of 1688, the failed Genevan Revolution of 1770, and the American and French revolutions. However, Enlightenment philosophers did not value revolution for its own sake or think it preferable to other methods for social reform. They condemned revolutionary movements driven by traditionalism and religion like Pugachev's rebellion in Russia.

Monarchy itself was the most obvious example of traditional privilege, and Enlightenment opinion was split on the subject. More radical philosophers opposed it, but moderates often found it pragmatically best to accept kingship as an institution and work with monarchical reformers. The ability of a strong monarch to defy the church and overcome vested interests and traditions was appealing to many philosophers. The Enlightenment conceived of monarchy as the calling of an individual to work for the good of the people. Monarchy must be subordinated to laws, and moderate Enlightenment thinkers sharply distinguished between lawful monarchy and despotism. To live under a despotism was to be no better than a slave. There was also, however, a strong republican strain in the Enlightenment, particularly marked in the works of Rousseau. Philosophers admired the ancient

republics of Greece and Rome and viewed the overthrow of the Roman republic in favor of the empire as a political tragedy. However, only a few radicals went fully in the direction of supporting democracy. Many others, including Voltaire, were suspicious of the uneducated and religious common people.

Philosophers supported radical reform of the judicial system, which in addition to upholding aristocratic privilege still admitted—and in some cases relied on—evidence obtained by torture. Enlightenment philosophers pressed with some success for the abolition of torture and moderation in the use of the death penalty. The protracted nature of legal proceedings was another favorite target. Voltaire and other French Enlightenment philosophers attacked France's hereditary magistrate class, the so-called Nobles of the Robe, for being more concerned with its own privileges than with the administration of justice. Despite their skepticism over the ability of the judiciary to produce justice, philosophes still preferred due process of law to arbitrary actions, such as the French king's power to arbitrarily imprison subjects. Persons living under such arbitrary rule, whether or not they were personally affected by it, could not be free.

Much of Enlightenment political philosophy was subordinated to the promotion of the Enlightenment agenda of practical reform. Political reforms that found broad support among the Enlightened included religious tolerance and the abolition of laws that infringed on personal liberty for religious reasons. Away from religion, Enlightenment philosophers usually favored a more equitable legal system, penal reform, the abolition of "unreasonable" privileges, the creation of a freer economic market, a reorientation of monarchical culture toward care for the people rather than military glory or conspicuous piety, and the abolition of slavery. Rulers who enacted such reforms could always count on support from some Enlightenment thinkers no matter how despotic they were as sovereigns. Frederick the Great of Prussia was particularly prominent among the absolutist rulers who won some Enlightenment support. However, the nondespotic religiously tolerant parliamentary government of Great Britain was often put forth as an ideal for emulation.

The Reign of Absolutism in Western Thought

Absolutism was the dominant form of government in Europe during the seventeenth and eighteenth centuries and occupied a central place in the political thought of the time. Theoretically, an absolute monarch had limitless and uncontested power; in practice, absolutist rule had many limitations. Political theorists of the period, particularly in France, generally agreed on the divine origins of the king's boundless power and were cautious to differentiate between absolutism and despotism. Although the monarch's power was theoretically unchallenged, it was expected to be contained within certain bounds.

Monarchs had to answer directly to God for their actions and were limited by the corporative nature of society. They were also bound by the fundamental laws of the realm (the Salic Law in France, for example, that determined succession to the throne) and by natural law, which meant that they were expected to respect the rights, freedoms, privileges, and property of their subjects. These limitations helped ensure that the kingdom would not be at the arbitrary mercy of the monarch.

Jean Bodin's (1529/1530–1596) *Six Books of the Republic* (1576) was one of the major works of political writing of the sixteenth century. Bodin's theory of sovereignty was at the core of this piece. Written during the French Wars of Religion (1562–1629), this treatise sought to vindicate the absolutist claims of divine-right monarchs by arguing that sovereignty had always belonged exclusively to the king. Sovereignty, being indivisible and absolute, must not be disputed by anyone. Nor could subjects attempt to depose their king no matter how bad he may have been,

➤ J. B. BOSSUET, *POLITICS DRAWN FROM THE VERY WORDS OF HOLY SCRIPTURE*, 1709

Politique tirée des propres paroles de l'Écriture sainte was written by the bishop Jacques-Bénigne Bossuet (1627–1704). Books I–VI were written in 1677–1679 for the Dauphin (Louis XIV's eldest son), whom he tutored during 1670–1680. Books VII–X were written in 1700–1704. The *Politique* was posthumously published in 1709. This is Bossuet's major political work and the one that established his reputation as a great theorist of royal absolutism. While the *Politique* was a means for instructing the Dauphin in his future obligations as king of France, it primarily served as a defense of the theory of divine-right absolute monarchy. Bossuet used the Bible as evidence for his thesis that the power of kings is directly derived from divine authority and is hence natural. Although Bossuet argued that the king's person was sacred and should not be subject to earthly scrutiny, he drew a clear line between absolutism and arbitrariness. Although all-powerful, an absolute monarch had to respect his realm's ancient rights and privileges and natural and fundamental laws. Having witnessed the horrors of the Fronde (1648–1653)—a series of unsuccessful civil wars during Louis XIV's minority—Bossuet knew how lethal the weakening of monarchical authority could be and understood how necessary it was for Louis XIV and his successors to promote the idea of an undisputed absolute divine-right monarchy.

—Joan G. Gonzalez

as it was prohibited by divine law. These ideas would later be echoed by Thomas Hobbes (1588–1679) who supported absolute government, arguing in *Leviathan* (1651) that sovereignty was absolute and that rebellion against it would be disastrous because it would lead humanity back to the bellicose state of nature.

Bodin's thought was further elaborated by Jacques-Bénigne Bossuet (1627–1704), who in his *Politique tirée des propres paroles de l'Écriture sainte* (1709) affirmed that the king's power was sacred, paternal, and absolute. As such, kings were representatives of God on earth and possessed quasi-divine powers. Bossuet also declared that civil disobedience should be unthinkable no matter how unjust a ruler was.

He did not, however, promote despotism, as he clearly urged kings to respect the *lois fondamentales* (fundamental laws) and their subjects' property.

Yet many early modern states were complex and decentralized and were composed of many groups, provinces, and cities with their own sets of privileges and laws, which the king was expected to respect and abide by. The absolutism of Louis XIV (r. 1643–1715), for example, was accomplished through a series of compromises with these various entities and was part of a process of constant negotiation that began during the period of the French Wars of Religion. In Spain there were actually more limitations than absolute powers because the king did not have jurisdiction in all parts of his kingdom. Furthermore, Spanish sovereigns were too dependent on the Cortes (the Castilian parliament), the pope, and royal officials such as the *corregidores*.

France and Spain also had distinct types of absolutism. In France, exemplified by the absolute monarch Louis XIV, everything was centered on the person of the king and revolved around a cult of personality. In Spain, especially during the reigns of Philip II (r. 1556–1598), Philip IV (r. 1621–1665), and Philip V (r. 1700–1746), there was a focus on kingship as a depersonalized institution. While French kings possessed more-than-human attributes, such as the royal touch that could cure scrofula, Spanish kings did not rule by divine right and were simply seen as administrators of the realm.

Not all thinkers, however, supported absolutism. John Locke (1632–1704) and Jean-Jacques Rousseau (1712–1778) were prominent critics of absolutism. As a supporter of the Glorious Revolution (1688–1689) and a key contributor to the English political debate between absolutism and constitutionalism, Locke argued in his *Two Treatises on Government* (1690) that the people have a natural right to replace tyrannical monarchs. For Locke, absolute power was by nature arbitrary and should be suspect. Rousseau likewise advocated in *The Social Contract* (1762) the possibility of overthrowing and replacing repressive rulers. Rousseau did not consider kingship sacrosanct and believed that the general will was sovereign, thereby

dismissing the whole concept of divine-right absolute monarchy.

These new theories about kingship were central to the Enlightenment and led to a new kind of rule: enlightened absolutism. Enlightened monarchs, such as Frederick the Great (r. 1740–1786) of Prussia, Catherine the Great (r. 1762–1796) of Russia, and Joseph II (r. 1780–1790) of Austria, tried to combine Enlightenment ideals with absolutist powers. These monarchs desacralized their persons and proposed reform programs designed to improve society, modernize the state, and increase their economic and military power. This essentially consisted of a political shift from “*L’état c’est moi*” (“I am the state”)—a saying wrongly attributed to Louis XIV—to Frederick the Great’s motto, “I am the first servant of the state.”

From Divine Right to Rational Foundations in Political Thought

The evolution of political structures in Europe from absolutist monarchies to constitutional representative institutions followed various courses in different states. The concept of divine right, which asserted that the monarch has absolute authority over the realm as a result of his power and legitimacy anointed by God’s will, was increasingly questioned by political thinkers in the wake of the Wars of Religion and the rise of the Enlightenment. The English Crown, which had shared some degree of political power with the representative institution of Parliament for centuries, offered a glaring example to be followed to devotees of the Enlightenment. In contrast, the increasing power of absolutist regimes in France, Prussia, Russia, and Habsburg Austria offered examples of the divine right of kings

infringed on aristocratic privilege, the rights of the emergent burghers, and the destitution and bondage of both the peasantry and serfs.

The political conception of the divine right of kings was not by definition a political theory but rather the amalgamation of different ideas in support of the absolute rule of the monarchy in early modern Europe. According to this concept, the monarch was granted the authority to rule over his designated realm through the will of God, who alone has the right to grant such power. This was partly based on the biblical tale describing the anointing of King Saul by Samuel by the authority of God in his designation of Saul as king of Israel. In the years following the Protestant Reformation, German rulers within the Holy Roman Empire sought to impose the concept of *cuius regio, eius religio* (“whose region, his religion”) on their subjects in the Peace of Augsburg (1555), at least for Catholics and Lutherans. It was not extended to Calvinists until the Treaty of Westphalia in 1648, which ended the Thirty Years’ War. These instances set a precedent in which a hereditary ruler had both absolute spiritual and secular authority over his subjects.

Nonetheless, in the quest for advocates of divine right to curtail the rights and privileges of the nobility, the peasantry, and the commoners, a surge of resistance emerged throughout Europe based on Enlightenment ideals and rationalist political discourse in the eighteenth century. In France, where Cardinal Richelieu, Cardinal Mazarin, and Louis XIV had created an absolutist monarchy that centralized all authority under the Crown, the nobility in the provinces countered by centering their own power in *parlements* (royal courts). Furthermore, the onset of the Jansenist movement, a fringe Catholic group in France that advocated predestination and was opposed to the influence of the Jesuits, also served as a spearhead in opposition to the growing power of the French monarchy. In their quest to reclaim and defend the privileges and rights of the nobility, many of these French aristocrats referenced old medieval laws that gave the nobility legal jurisdiction and right to representation. Using the *parlements* as their pulpit, these nobles resisted French royal encroachments, resorting to flight when disbanded under royal decree but nonetheless influencing

► FROM HOBBS TO MACHIAVELLI—LEVIATHANS, PATRIARCHS, AND PRINCES

Early modern European political theorists, while recognizing the political interests of the masses, were also aware of the differing interests of various sectors of society. The ideas of Niccolò Machiavelli (1469–1527) and Thomas Hobbes (1588–1679) have been regarded by scholars to be either cynical or utilitarian, given the context of the era. In his book *The Prince* (1532), Machiavelli viewed a strong prince, in the context of the chaotic and anarchic Italian city-states of the Renaissance, as one who could exert his legitimate authority through his willingness to resort to force. Writing from a later period and in the context of the English Civil War and the Cromwellian Protectorate, Thomas Hobbes in his work *Leviathan* (1651) also advocated a strong central authority in order to represent the interests of the realm and end the factionalism created by civil war and domestic discords. Both of these works advocated strong initiative (or brutal repression) by the ruler to impose order and maintain stability given the alleged flaws in human nature and behavior, which were not conducive for an orderly society.

—Abraham O. Mendoza

the discussions taking place in the salons of the wealthy back in Paris. The Fronde (1648–1653), which was a series of rebellions by the nobility against Mazarin's rule, was also triggered by absolutist centralization.

Enlightenment political theorists, such as Thomas Hobbes, John Locke, Baron de Montesquieu, Voltaire (François-Marie Arouet), and Jean-Jacques Rousseau, critical of the existing paradigm, proposed new ways to formulate government according to rational principles that advocated for representation of various social group interests, institutionalized checks in the power of the executive, and fixed laws that the monarch abide by in governing. England was a special case because during Henry VIII's reign, he granted Parliament more power in return for their acceptance of him as the head of the Anglican Church. Furthermore, since English nobles paid taxes, they felt that they had more of a stake to play in the English Parliament. In

spite of the absolutist tendencies of the House of Stuart under James I and Charles I, the English Crown devolved much of its political authority to Parliament following the English Civil War (1642–1651) and the Glorious Revolution (1688–1689), in effect illustrating the potential effectiveness of representative institutions. The English political philosophers Hobbes and Locke both purported that the Crown had to rule within the established law and adhere to the interests of the people, which composed the body politic of the realm. However, they differed on the degree of power that such a representative institution should carry, with Locke advocating for more representation. In spite of living in absolutist France, French intellectuals such as Montesquieu, Voltaire, and Rousseau were critical of the Old Regime and suggested a new course for France. In France, the Baron de Montesquieu, while sustaining the argument for the monarchy, recognized that its power should be checked and balanced by that of a legislature, such as that of Parliament in England, and a fixed body of law through the courts. Voltaire, critical of the trappings of the Old Regime, attacked the monarchy, the nobility, and the Church, advocating radical positions regarding human liberty for the commons while retaining conservative positions regarding the masses. Rousseau, who much like Hobbes believed in the interests of the masses (conceptualized in his idea of the General Will), recognized that while it must be acknowledged by the monarch, said monarch as a representative of it had the right to do what he felt was right for the interests of the masses.

Anglo-Portuguese Relations

The beginning of Anglo-Portuguese relations is traditionally dated to the twelfth century. In 1147 a group of English crusaders journeying to the Holy Land helped King Afonso Henriques

(the first king of Portugal) capture Lisbon from the Moors. Their alliance was formalized in 1387 with the Treaty of Windsor. Most of the time, the two countries were able to find friendship in their common enmity for the Spanish. However, outside political forces did not always allow for the two countries to honor their allegiance.

In 1580 Philip II of Spain was able to use his claim to the Portuguese throne in order to invade Portugal. Due to the alliance with the English, many Portuguese people expected Elizabeth I to provide assistance, especially because Spain's annexation of Portugal was a threat to England since it would double the size of the Spanish empire. Despite this, she did not help because she was trying to avoid war with Spain. Instead of direct help she used subtle measures against the Spanish, namely allowing privateers like Sir Francis Drake to attack Spanish silver fleets returning from the Americas while claiming no knowledge of the attacks and sending aid to the Protestant Dutch who were rebelling against Spain. The situation changed after 1588, however. The English navy defeated the Spanish Armada, and Elizabeth saw this as an opportunity to use Portugal against Spain. The plan was to send troops into Portugal and attempt to incite a nativist revolt against the Spanish. However, the goal of this plan was to hurt the Spanish and destroy the remnants of the Armada, not to help the Portuguese. By the time the English army reached Lisbon, a majority of the soldiers had succumbed to illness, which was exasperated by their indulgence in Portuguese wine. Once they reached the capital, they were disappointed to find that the Portuguese were not as ready to revolt as they had been eight years previously, and the plan was a complete failure.

When the Portuguese finally did revolt in 1640, the new king João IV faced many diplomatic and economic problems. Other European countries were reluctant to recognize Portugal's independence at the risk of starting war with Spain, especially since the Thirty Years' War had just ended. King Charles I of England was one of the few monarchs willing to receive Portuguese ambassadors and negotiate a treaty. He himself was having his own problems, as England was on the verge of a civil war. In 1642 Charles and João signed a treaty whereby English merchants

THE MARRIAGE OF CATHERINE OF BRAGANZA TO CHARLES II OF ENGLAND

When Catherine of Braganza set sail for Portsmouth on April 25, 1662, she had no idea what to expect out of Charles II as a husband. The marriage treaty had been advantageous for both countries: Portugal had acquired the military assistance necessary to win a war against Spain, and Catherine brought the largest dowry ever brought by an English queen consort, £1 million sterling. While the marriage looked good on paper, the actual relationship would turn out quite differently. Prior to his marriage, Charles was already having an affair with Barbara Palmer, who was pregnant with their second child. Palmer was just one of many mistresses whom Charles kept throughout their marriage, producing 12 illegitimate children (6 with Barbara Palmer alone), two of whom are ancestors to Princes William and Henry of England on their maternal side. Charles's relationships caused quite the scandal at court, as he paraded his mistresses along behind him, buying them expensive pieces of jewelry and providing lodgings for them at Whitehall Palace.

Despite the amount of women who passed through Charles's bedroom, he remained loyal to Catherine throughout their marriage. As the years went on, many members of Parliament became concerned at Catherine's lack of ability to produce a live heir (she had several miscarriages and stillbirths). They knew that if Charles died without legitimate issue, his brother James would be next in line for the throne. This was worrisome because many suspected James of being a crypto-Catholic, and they did not want to see a Catholic on the throne. Many suggested to Charles that he divorce Catherine in favor of someone who could produce him a child. He always refused this adamantly (possibly because he was a secret Catholic). Other suggestions included allowing him to commit bigamy, sending Catherine to a convent, and legitimizing the Duke of Monmouth, his eldest son. Charles refused all of these requests. Desperate, a "Popish plot" was fabricated in 1678 in which Catherine was accused of plotting to poison the king. He never did believe the charges, and Charles even defended her after Parliament voted to have her banned from the palace in 1679. Charles remained married to Catherine until his death in 1685, hours after converting to Catholicism.

—Monique Vallance

were given easier access to the Portuguese colonies, and English merchants residing in Portugal were given freedom of conscience and allowed to hold Anglican religious services. In return, Portugal received the friendship and recognition of the English, the first step toward being recognized by the rest of Europe.

When rebellious Parliament members executed Charles I in 1649, João found himself in a new realm of diplomacy. He was caught in a difficult position: although he had supported Charles as a fellow monarch, he did not want to incur the odium of Oliver Cromwell. While João attempted to remain neutral, circumstances dictated otherwise. Prince Rupert, the Count of Palatine of the Rhine and nephew of Charles I, had been appointed the commander of the royalist fleet. After several battles with the parliamentarians, he was eventually forced to take refuge in Ireland. Shortly thereafter Cromwell invaded Ireland, and Rupert asked João's permission to flee to Portugal in November 1649. João granted him permission but withdrew it when Rupert began using Lisbon's port as a base of operation for attacking English merchant ships. While João was obviously a royalist sympathizer, Rupert's actions were both harming trade and angering the English Commonwealth. Ten months passed before the Portuguese were able to finally oust Rupert from Lisbon in 1650, but relations with England had significantly soured by then. The English were on the verge of declaring war on Portugal. It took Portuguese diplomats four years before a treaty could be negotiated with the new government. In this new treaty of 1654, the Portuguese were forced to grant several concessions to the English concerning trade while only receiving the promise of peace and mutual friendship in return.

Although Portugal paid dearly for assisting the Stuarts in 1649, this effort would be rewarded in 1660 when Charles II returned to England and assumed the throne. Charles's first order of business in England was finding a bride. His financial woes were great, as he was left with enormous debts accumulated from both his father and his own court-in-exile. Although the Spanish ambassador did his best to obstruct the marriage negotiations, Charles agreed to marry João's daughter Catherine of Braganza

in 1661. This alliance would provide England the largest dowry ever brought by any queen: £1 million. Portugal would also reconfirm the treaty of 1654 as well as cede the territories of Bombay and Tangier to England. However, this time Portugal actually received something tangible in return. Charles promised English ships to be used in the defense of the Portuguese coast against Spain as well as the use of English troops for land campaigns on the Portuguese frontier. While this treaty was widely criticized in Portugal due to the loss of territories, it was the main reason that Spain abandoned the hope of reacquiring Portugal in 1668. Once they had the promise of English defense, the Portuguese were safe from the Spanish armies, and peace was finally declared.

England and Portugal's relationship partly consisted of economic ties, and these influenced their mutual political interests as well. After the beginning of the eighteenth century Portugal would come to England's aid, even to its own detriment. For instance, the Portuguese fought alongside the English troops during the War of the Spanish Succession (1701–1714), and even though it cost them dearly, they made no gains from the outcome.

Development of Habsburg Policy

From the late fifteenth century well into the eighteenth century, the Habsburg royal family played a significant role in the power politics and international relations of the major European powers. Through key marriage alliances with Spain, Austria, and France, the Habsburgs were able to create composite kingdoms that included not only vast areas of Europe but also overseas possessions in the Americas, Asia, and Oceania. However, over the centuries major conflicts with

rebellious Lutheran princes within the Holy Roman Empire and the Dutch provinces amid the religious schisms caused by the Protestant Reformation, various wars with the French Bourbons, and border skirmishes with the Ottoman Turks preoccupied the Habsburgs and limited their ability to centralize their control over Central Europe.

In the mid-fifteenth century the Habsburg family was able to acquire a substantial amount of land through marriage in the southeastern portion of the Holy Roman Empire as well as ensure the continual election of their family scion as Holy Roman emperor. In 1477 Archduke Maximilian I of Austria married Mary of Burgundy, thereby securing control of the Netherlands. His son Phillip married Juana in 1496 (daughter of Catholic king Fernando of Aragon and Isabel of Castile), thereby acquiring the Spanish dominions and American colonies for the Habsburgs. Their son Carlos I of Spain, when elected Holy Roman emperor (1519), became the famous Charles V, who ruled Spain, Spanish holdings in the Netherlands and Italy, Spanish America, and Austrian holdings in the Holy Roman Empire. Under Charles V, the Habsburgs ruled the largest land empire held by Europeans up to that time.

In 1521, possession of the Austrian lands was delegated to Ferdinand I by his brother Emperor Charles V, thereby effectively splitting the Habsburg domains between two family branches. This was due to the fact that Charles found it nearly impossible to rule over so many kingdoms effectively amid the rebellions in Castile and the schisms caused by the Protestant Reformation in the German realms. After 1556 the Austrian Habsburgs held the title of Holy Roman emperor and the Habsburg hereditary lands (both kingdoms of Bohemia and Hungary). The Spanish Habsburgs ruled over the Spanish kingdoms (Castile, Aragon, and Portugal), the Netherlands, the Habsburgs' Italian possessions, and the American colonial empire. Revolts in the Netherlands and in Catalonia and Portugal in 1640, along with the piracy and maritime competition ignited by Tudor England in the sixteenth century, distracted the attention of the Spanish Habsburgs. Portugal was only held from 1580 to 1640. The Austrian Habsburgs fought the Thirty Years' War (1618–1648) against the

➤ THE *EINRICHTUNGSWERK* OF CARDINAL KOLLONICH, 1683–1690

In the 1680s, Cardinal Kollonich was put in charge of Hungary's finances by Austrian emperor Leopold I amid efforts by Magyars to resist centralization of their affairs by Habsburg authorities. Kollonich, serving his Catholic sovereign, managed to anger many a Protestant Magyar by appointing and favoring Catholics and persecuting dissenting Hungarians. Nonetheless, Magyars continued to struggle against these pressures, often with external support from Bourbon France or the Ottoman empire. From 1683 to 1690 the Austrian policy of centralizing its control over the Kingdom of Hungary proved unpopular as it emulated absolutist practices already common throughout Europe, most notably in France.

—Abraham O. Mendoza

Protestant electors in an effort to centralize the power of the Catholic Habsburg emperor amid revolts in Bohemia and northern Germany. Farther east, the Kingdom of Hungary, under de jure Habsburg suzerainty from 1526 but under de facto Ottoman occupation for 150 years, was finally recovered at the end of the seventeenth century by the Austrian Habsburgs and their Polish allies, which were responding to Ottoman threats to Vienna.

The Spanish Habsburgs died out in 1700 with the passing of Carlos II, who was unable to procreate due to impotence, and prompted the War of the Spanish Succession after Carlos willed the Spanish throne to Louis XIV's grandson, Philip. This was contested by the Austrians, who feared a pro-Bourbon power block in western Europe. The war ended with the acceptance that while Spain would have a Bourbon monarch, the French Bourbons would not be allowed to seek the throne for its own heirs. When the last male heir of Austrian Habsburgs died out in 1740, the situation also prompted a major intra-European war (War of the Austrian Succession, otherwise known as the Seven Years' War). The emergent Kingdom of Prussia refused to acknowledge the legitimacy of the female heir, which was enacted through the Pragmatic Sanction signed by most of the electors.

Maria Theresa, the heiress of the last Austrian Habsburg, married Francis Stephan Duke of Lorraine in 1736, and their descendants carried on the Habsburg line from Vienna under the dynastic name Habsburg-Lorraine. At this point, the Habsburg royal family was relegated to retaining the position of Holy Roman emperor by a male heir until the abolition of that political entity by Napoleon Bonaparte in 1806. Nonetheless, the emperors of Austria, along with the kingships

of Bohemia and Hungary, were always inherited by Habsburgs until 1918.

■ Introduction: Politics and Religion

The religious changes of early modern times were intimately bound with politics, and if anything politics and religion moved closer in this period. Political authority was also religious authority, whether it was the Protestant English monarch, the “Defender of the Faith”; the Ottoman sultan, the inheritor of the caliph’s power over Sunni Islam; or China’s “Son of Heaven.” However, religopolitical authority could take a variety of forms both domestically and internationally. One extreme was marked by the Spanish monarchy, which boasted of the rigidity with which Catholicism was enforced throughout its worldwide dominions. The legendary Spanish Inquisition was a powerful tool for enforcing internal conformity, one on which the papacy consciously modeled the Roman Inquisition, a key institution of the Catholic Reformation. However, even the king of Spain, “His Catholic Majesty,” on occasion was known to hire Muslim or Protestant soldiers or ally with non-Catholics. Tokugawa Japan, after the suppression of Christianity in the early seventeenth century, was also an officially intolerant state, with every Japanese required to be affiliated with a Buddhist temple. Some rulers, such as England’s Henry VIII or Akbar of the Mughal dynasty of India, even fundamentally reshaped religion in the hope of better serving state or personal needs. Henry had more success than Akbar, whose new religion never spread far from his court.

Some states were strongly affiliated with a particular religion but tolerated others. Drawing on a legacy of Islamic tolerance, the great

Muslim empires of the Ottomans, Safavids, and Mughals tolerated to varying degrees Jewish, Christian, Zoroastrian, and Hindu communities that were allowed self-government in many areas. The Dutch Republic, while maintaining an official religion of Reformed Protestantism, also tolerated all Christian sects, including Catholicism, and Judaism as well. Generally, Protestant states were more tolerant than Catholic ones, particularly after Catholic Poland and France became more intolerant in the late seventeenth century and Protestant England became more tolerant. Religious toleration was not religious equality and throughout much of the world was seen as a necessary evil for civil peace and economic prosperity rather than a positive good. European Jews in particular benefited from the widespread belief that tolerating a Jewish community was economically advantageous, an argument for which the Dutch example was particularly powerful.

Generally, rulers sought to control the religious organizations within their realms. This was particularly the case with European Protestantism in which the international organization of Catholicism was replaced by a series of national Protestant churches. Control over religion could be something more of a challenge for Catholic rulers, as the pope always retained a degree of independence regardless of the influence that powerful secular rulers could bring to bear. Buddhist and Muslim rulers, faced with religions with less central organization than Christian denominations, could also face internal challenges.

Japan was challenged by powerful Buddhist monasteries or Islamic states by the ulama of the great cities. Religious differences could lead to dangerous internal divisions, as could be seen in the British Civil Wars of the mid-seventeenth century or the Christian Shimabara uprising in Tokugawa Japan.

Reformation Germany

The Protestant Reformation had its beginnings in Germany (the Holy Roman Empire). As an intellectual movement that began among clergy, the movement experienced a swell of popular support that spread rapidly throughout various social classes, influencing other reformers all over Europe. The lack of national unity that characterized the German states at the time contributed to an environment that was naturally conducive to new and innovative thinking, as Germany lacked the anchor of strong monarchy found in other places in Europe at the time. Since the time of the collapse of the western Roman empire, the German states were loosely constituted into the Holy Roman Empire, governed by central institutions that lacked consistent authority. These institutions included the office of Holy Roman emperor, elected by an electoral college, and the Imperial Diet, a legislative body that met to formulate policies but lacked true enforcement ability, given the independence of various German states. Germany also lacked consistent and cohesive systems of taxation, resulting in further decentralization of power. These unique political conditions combined with the religious innovations of Protestantism to bring about dramatic social and political consequences in the sixteenth century, eventually contributing to a series of religious wars that devastated Europe.

The traditional dating for the beginning of the Protestant Reformation in Germany is October 31, 1517, and the “protest” first registered by Martin Luther in his *Ninety Five Theses against the Sale of Indulgences* at his parish church in Wittenberg. The initial reaction to Luther’s ideas produced chaos and division and eventually contributed to political rebellion. Holy Roman emperor Charles V summoned Luther to a meeting of the Imperial Diet held at Worms in April 1521.

At that meeting Luther defended his views before an assembled body of nobles of Germany, at least some of whom agreed with Luther. When asked by the emperor if he was willing to continue to stand by what he had written, Luther was firm in his resolve. He left Worms under the protection of Frederick (the Wise), the elector of Saxony, and lived under the elector’s protection at a privately owned castle in Warburg. After Luther’s departure, the Imperial Diet issued the Edict of Worms, which condemned Luther and declared him an outlaw, prohibiting any innovations that might result from Luther’s ideas. However, the protection of powerful German nobles made the Edict of Worms impossible to enforce.

Reformation thought ignited discontent among various groups of the German population.

➤ VIOLENCE AND THE REFORMATION

Violence characterized the Reformation in Germany as radical ideology took shape among various factions that diverged from Luther’s original protest movement. One of the most significant among the rebel leaders of the Peasants’ Revolt, Thomas Muntzer, radicalized the Reformation thought of Luther and incited approximately 8,000 peasants into battle against a heavily armed Philip of Hesse at the Battle of Frankenhausen in May 1525. The superior training of artillery of Philip’s forces meant a slaughter of thousands of peasants, and Muntzer surrendered and was executed. Another dramatic incident of religious violence resulted from the fanaticism of an Anabaptist named John of Leiden, who claimed to have established the “New Jerusalem” in Munster, Westphalia, in 1532. In an effort to establish a cultlike theocracy, Leiden claimed to be the descendant of King David and took multiple wives, legalizing polygamy for the entire community. Leiden forced his followers to live communally and allowed no holding of private property. Franz von Waldeck, the bishop and prince of Munster, besieged the city in June 1535, killing many of Leiden’s followers before capturing and executing Leiden. The turbulent religious atmosphere of Reformation Germany produced reaction and radicalism, which unfortunately often resulted in brutal violence.

—Cheryl H. White

THE REFORMATION, 1517–1560

A revolt in the Rhineland among petty German nobility in 1522 erupted amid the religious and political dissent that Lutheranism produced. While imperial troops quickly suppressed this revolt, a second and potentially more serious rebellion, known as the Peasant's Revolt, broke out among lower classes in southern Germany during 1524–1525. Luther's message in many ways represented a challenge to old institutions, and again many of the rebels cited Lutheran sympathies and inspiration. The abuses of the feudal structure in Germany were probably the

main reason behind the unrest and violence, but peasants were quick to invoke Luther's teaching about Christian freedom. Religion quickly became a framework for expressing social and political discontent in the German states.

At the same time as the Reformation in Germany, there was the rise of the burghers, a new emerging business and commercial class. The individualism seemingly expressed in Reformation thought found a following among this class, who wanted the freedom to pursue their business interests without the medieval barriers linked to

the Church's teachings on usury and profits. An intellectual attack on these traditional Church teachings naturally had broad appeal in this environment, and this population began to demand economic changes.

The prospect of religious change touched upon the political realm in a profound way. Many of the German princes embraced the new Reformation ideas, forging the Alliance of Torgau in 1526 to provide for their mutual defense against rival German states that did not agree. This alliance succeeded in securing a resolution at the Diet of Speyer in 1526 that permitted territorial princes to make decisions regarding the religious condition of their provinces. This only served to increase division and tension among the German states. The Diet of Augsburg that met in 1530 formalized a confessional statement that expressed the theology of Lutheranism and further distanced the Catholic states from those claiming Reformation.

By 1531 the major Protestant cities and provinces of Germany united in the Schmalkaldic League, an alliance based on strengthening religious reform and providing for mutual defense. In effect, a military attack launched against any of the signatories resulted in the interpretation that it was an attack on all. The principal parties to this agreement included some of the most powerful of the German princes: Philip of Hesse, John of Saxony, and Philip and Otto of Brunswick, among others. Saxony and Hesse took on the role of a military command structure should the need arise. The league secured the cooperation of Denmark in 1538. Certain that the league could now forcefully impose the Reformation in the resistant territories of Germany, they began confiscating church property and seizing bishoprics in several areas. Roman Catholics responded with the formation of the Catholic League in Nuremberg in 1538. The Holy Roman emperor gave his backing to the Catholic League and pledged imperial troops if armed conflict resulted.

With war a real possibility, the Holy Roman emperor attempted compromise and concessions. At the Diet of Regensburg in 1541, Charles V attempted in vain to achieve a reduction in tension among the German states, but the Reformation had splintered into various factions that were irreconcilable. The Roman Catholic

Church called the Council of Trent in 1545, just a year before Luther died, in an attempt to formulate a response to the Protestant Reformation. In 1547 Charles V won a victory over the Schmalkaldic League at Muhlberg and captured Duke John Frederick of Saxony. Philip of Hesse also surrendered. The idea of a united Germany startled France into launching an invasion of Germany in 1552, contributing to resurgence of Protestant strength. The Peace of Augsburg in 1555 permitted every principality in Germany to follow the faith of its prince, a result that amounted to little more than a lengthy truce but not an end to religious war.

Reformation in Switzerland

At the time that the Protestant Reformation broke out in Germany in the early sixteenth century, Switzerland was a loose confederation of 13 independent cantons, or states. Just like other regions of Europe, Switzerland experienced the same disenchantment with the late medieval Roman Catholic Church. A large portion of the Swiss population spoke German; therefore, the publications of Martin Luther were widely read there. The immediate impact of Reformation ideas in Switzerland was subtle, with reformative ideas initially appearing in Sunday sermons and resulting in a general questioning mood among the clergy. By 1525 the new thinking of the Reformation era shaped Switzerland through men who took the ideas of Martin Luther and modified and adapted them to uniquely Swiss ends.

The main promoter of Reformation in Switzerland was Ulrich Zwingli from Basel. Drawing inspiration from Martin Luther, Zwingli was a priest in Zurich when he chose to marry in 1523, deliberately challenging the Church's historical position on clerical celibacy. This led to a public hearing in Zurich before the City Council

in January 1523 known as the Public Disputation of Zurich, where Zwingli defended his opinions on reform thinking. Zwingli offered arguments based on the ultimate authority of Holy Scripture, citing specific doctrines of the Church unsupported by biblical foundations. Because of Zwingli's persuasion and leadership, the Church in Zurich underwent significant changes, including greater secular control over the functions of the Church and its clergy. By 1528 many of the major cities of other Swiss cantons had all accepted Protestantism.

Many considered Zwingli's personal theology to be more radical than that of Luther, particularly with regard to his understanding of the nature of Christ's presence at the Eucharist. While Luther held to a theology based on the mystery of Christ's "Real Presence" in the bread and the wine, Zwingli held that the elements were merely symbolic and that the Eucharist was a simple commemoration of the Last Supper. Because of the potential for this disagreement to rupture Protestantism in its infancy, the two men met at Marburg in 1529 and engaged in a public debate to attempt to reconcile their theological differences but failed. This resulted in a distinct separation within the Protestant movement surrounding key points of theology.

While many of the Swiss cantons followed some form of reformed theology, the cantons of Uri, Schwyz, Unterwalden, Lucerne, and Zug remained Roman Catholic. This inevitably led to discord and a deepening divide that erupted into a violent series of religious wars between Protestants and Catholics, waged not only for religious reasons but also for economic ones. In 1531 Zwingli died fighting in the Second War of Kappel, which was a victory for the Catholic cantons. Because of these conflicts, Zurich allied itself with the Schmalkaldic League, an alliance of Lutheran princes in Germany, but endeavored to remain neutral during the German religious wars of the next decade. Following Zwingli's death, Heinrich Bullinger took over the reform efforts in Zurich and was instrumental in the development of the Helvetic Confessions, which were a summation of common beliefs among reformed thinkers of Switzerland in this era.

Due to the potential for economic, religious, or political conflict erupting into violence

throughout the Swiss cantons, there was little room for tolerance of radically divergent views such as those held by a group known as the Anabaptists. Zurich banned this faction from the city in 1525 for its unpopular views on the rebaptism of adults, and the Anabaptists soon found themselves persecuted throughout Switzerland and Germany by other Protestants and Catholics alike. The Anabaptists did not believe in infant baptism and separated themselves from mainstream society. This faction is the forerunner of groups such as the Amish and the Mennonites, who fled Europe for the New World beginning in the seventeenth century to escape religious persecution.

The city of Geneva in Switzerland accepted John Calvin's teachings and organization of an established reformed church. Calvin was a lawyer from Paris who fled France in response to Francis I's opposition to Protestant teachings. Geneva did not receive Calvin well on his first visit, and the city banished him in 1538, but the City Council invited him to return in 1541. By that time Calvin had already published his signature work, *The Institutes of the Christian Religion*, in 1536. Calvin clearly articulated a theology of Divine Predestination, based on his understanding of God's supreme sovereignty and providence for His creation. According to Calvin, there are human beings who are predestined for salvation; therefore, there are also those predestined for damnation. Accordingly, God's elect behave according to rigid moral guides, so the city of Geneva became a theocracy guided by strict Calvinist principles.

Calvin worked to reform the organization of the Church by seeking a model like that of the "primitive" Church, that of the earliest Christians. He therefore rejected a model that required ordained priests and consecrated bishops and instead relied upon a model of governance known as a presbytery. In supporting Calvin's call for staunch reform, the City Council of Geneva adopted his *Ecclesiastical Ordinances*, establishing a Consistory, which was a ruling council of elders who could punish citizens in violation of moral laws such as usury, gambling, or participating in traditional Catholic religious behaviors. The Consistory operated as the primary means of regulating private morality within the city of

Geneva, an aspect of Calvin's Reformation that was particularly important to his theology of God's elect.

Although the Zwinglian and Calvinist branches of Reformation remained separate influences throughout Switzerland and the rest of Europe, under the leadership of Bullinger and Calvin in 1549 the two factions agreed upon the Zurich Consent. This accord consolidated the variant Protestant opinions against the Roman Catholic doctrine of transubstantiation and the Lutheran teaching on Real Presence. Calvin's influence extended far beyond Switzerland and into the New World, England, and Scotland, where the theology of Calvinism became foundational to many Protestant groups. At the time of Calvin's death in 1564, his movement had surpassed Lutheranism as the dominant intellectual force in Europe.

The English Reformation

The religious movement that swept through Europe in the early sixteenth century, known as the Protestant Reformation, took a different turn when it reached England. A movement that was embraced by some peasants and German princes caused a firestorm that would rage throughout the European continent during the sixteenth century. In England, the nature of and reaction to the Reformation took a much different form, causing less turmoil. The reason for this is probably because the English Reformation was rooted in political causes rather than necessarily religious ones.

King Henry VIII (r. 1509–1547) led the way for England's separation from the Roman Catholic Church. However, when the Reformation started in 1517, he did not agree with Martin Luther's theological arguments against the Church. In fact, Henry was awarded the title “Defender

of the Faith” by Pope Leo X in 1521 for his pamphlet titled *Assertio septem sacramentorum adversus Martinum Lutherum* (*Declaration of the Seven Sacraments against Martin Luther*). However, events in his life would cause Henry's loyalty to the Church to change.

Henry's elder brother, Arthur, died in 1502, leaving behind a widow, Catherine of Aragon. Henry VII was not keen to return the dowry he had received from King Fernando and Queen Isabella and therefore kept Catherine in a state of limbo at the English court while he decided what to do. In the end, he decided to marry Catherine to his son Henry, and a special papal dispensation was granted in order to allow the marriage. However, the marriage still did not take place until 1509, just before his coronation as Henry VIII. Despite the bride being six years older, Henry and Catherine's marriage seemed to be a relatively happy one for the first few years. Unfortunately, Catherine was plagued with reproductive issues, and by the 1520s she had only produced one living child, a daughter named Mary. The Tudor Dynasty was still a new one, and the lack of a male heir began to worry Henry. The last time England had been ruled by a female was during the reign of Empress Matilda in 1141. During this time, Henry managed to produce an illegitimate son named Henry Fitzroy, which proved to him that he was able to produce a male heir and that something must be inherently wrong with either Catherine or his marriage. It was this belief that led him to begin seeking an annulment for his marriage in 1527, based on a passage in the Bible (Leviticus 20:21) that forbids a man from marrying his brother's widow. The Catholic Church does not allow divorce; the only way a person is allowed to remarry is if he or she is widowed or obtains an annulment (a document stating that the marriage never occurred). Another reason he began to seek an annulment was his relationship with Anne Boleyn, who refused to have a sexual relationship with the king without marriage. At 42, it looked as though Catherine was beyond her child-bearing years, and the young Anne Boleyn seemed to be Henry's only chance of producing a male heir.

His annulment was to be based on the premise that Pope Julius II was wrong to grant the papal dispensation that allowed Henry and

➤ QUEEN FOR NINE DAYS

Born in 1537, Lady Jane Grey, a great-niece of Henry VIII, was thrown into a political whirlwind when she married Lord Guilford Dudley, son of the first Duke of Northumberland. The young king was ill and without heirs, causing Northumberland and his supporters to worry as the Third Succession Act, passed in Parliament before Henry VIII's death, had established Edward's sister Mary as his successor. This posed problems. A Catholic Mary would be likely to return England to the Roman Catholic Church, and the Protestants wished to avoid this fate. As a result, Edward changed the succession as he lay on his deathbed in 1553 to pass over his sisters and instead fall to the Protestant heirs of Edward's great-aunt Mary. This change placed Jane as the heir presumptive, something her father-in-law was quick to take advantage of once the king died on July 6, 1553. By July 10 Northumberland had her proclaimed queen, and she went to the Tower of London to await her coronation. Meanwhile, attempts were made to seize the Lady Mary before she could gain any supporters, but she was able to escape to Suffolk.

By July 19 Mary rode into London to reclaim her throne. Many of Jane's supporters quickly switched their allegiance back to Mary, and both Jane and Dudley were imprisoned in the Tower of

London. Initially Mary was inclined to spare Jane's life because Mary recognized that her cousin had been only a pawn in her father-in-law's political machinations. The Duke of Northumberland was convicted of treason and executed on August 21, 1553. The couple was charged with high treason and found guilty in November 1553, but their death sentences were not carried out.

Unfortunately for Jane, Wyatt's Rebellion erupted in January 1554. The rebellion protested the queen's impending marriage to her cousin, Philip II of Spain, and its supporters included Jane's father, the Duke of Suffolk, and others who had supported Jane's brief ascension to the throne. The rebels also called for Jane's reinstatement as queen. Philip's ministers began pressuring Mary to have Jane and Guilford executed, and the queen realized that Jane's continued existence would remain a rallying point for rebels. On February 12, 1554, Guilford Dudley was taken to Tower Hill and beheaded in public. Jane was then taken to Tower Green and beheaded in private, a privilege usually only extended to members of royalty. Her actions show that Mary probably regretted the execution of 16-year-old Jane. Queen Mary died four years later, and the fears of those who initially supported Jane's coronation were put to rest.

—*Monique Vallance*

Catherine to marry in the first place. Catherine defended herself using Deuteronomy 25:5, a passage that directs men to marry their brother's widow if they are childless. Catherine also claimed that her marriage to Arthur was never consummated. Unfortunately for Henry, the current pope Clement VII was in a position whereby he could not grant the annulment. The Holy Roman emperor and Catherine's nephew, Charles V, had only recently sacked Rome and taken the pope prisoner. This left Clement in a tough political position. He could not risk angering Charles by allowing Henry to put his aunt aside, but he did not want to lose England to the reformers either.

Meanwhile, Henry's attempts at obtaining the divorce assured Anne that she would eventually marry the king, and she finally submitted to a sexual relationship with him. This resulted in

a pregnancy, and the couple married secretly in January 1533, which made Henry frantic to obtain the divorce so he could marry Anne before the birth in order to guarantee its legitimacy. The pope, in an impossible situation, attempted to negotiate with Henry, even offering to legitimize any children born to Anne, but Henry would have none of it. By this point, he wanted only divorce. Between 1529 and 1553, several laws were passed that effectively solidified England's break with the Catholic Church and confirmed Henry's role as supreme head of the Church of England. He used this role to confirm his marriage to Catherine as null and void and his marriage to Anne legitimate. Unfortunately for Henry, Anne's pregnancy resulted in another female offspring named Elizabeth in September 1533.

Throughout Henry's rule, his Reformation remained a political one. While he did not return

England to the Catholic Church, he never made any radical changes to the rituals, and the new Church of England remained liturgically close to the Catholic Church. This would change after his death in 1547 when his nine-year-old son Edward VI would ascend the throne. The son of Protestant Jane Seymour, Edward was more adherent to the reforming ideas than his father ever was, and what had been a political reformation now became a radical religious reformation. During Edward's reign, the Church of England changed in ritual and procedure. All images, bells, silver, and any other adornments were ordered removed from all churches. Clergy were forbidden from wearing vestments and were allowed to marry. Finally, the Book of Common Prayer was introduced in 1549, the first prayer book written for the Church of England. A revision was written in 1553 but would not come into use because of Edward's death that same year.

Henry's first daughter, Mary, was the next to come to the throne. Raised as a devout Catholic, Mary was intent on bringing England back into communion with the Church. Those whose fortunes were invested in keeping Protestantism became nervous; many members of Parliament had bought church lands nationalized by Henry in the 1530s, something they were not eager to return. Another event to make them nervous was the marriage of Mary to her cousin Philip in 1554. Even though the marriage contract provided that he would not be crowned and would receive no inheritance without an heir, the ties to Catholic Spain were still not desirable. Mary also began to persecute Protestants. John Foxe estimated in his *Book of Martyrs* that 284 people were burned at the stake, although there are no concrete figures to confirm this. These executions earned her the name Bloody Mary. Approximately 800 Protestants left the kingdom during the reign. Mary's short but turbulent reign was ended in 1558 when what she thought was a pregnancy turned out to be stomach cancer.

Elizabeth, the last of the Tudor monarchs, would be the one to finally settle the question of religion in England with the Elizabethan Settlement. Although raised as a Protestant, Elizabeth was anxious to settle the religious problem in her kingdom and found a middle way. Upon her ascension to the throne, she repealed the

acts instituted by Mary and brought England away from the Catholic Church once again. Part of this settlement was the Act of Uniformity in 1559 that required that all subjects attend Anglican services on Sundays or else pay fines. The Elizabethan government did not care what its subjects believed personally but only cared that they adhere to the Anglican Church outwardly. Included in this was a new Book of Common Prayer, which was a revision of the one published during the reign of Edward VI but with all derogatory remarks aimed at the pope removed. It also allowed for participants to either stand or kneel and to participate in Communion as a remembrance or transubstantiation, the belief that the Eucharist was transformed into the body and blood of Jesus Christ. The Church of England now offered enough flexibility so that both sides of the religious conflict could participate in the Church. However, it was during this time that the group known as the Puritans began to emerge. These Puritans, as they were called by their detractors, were interested in "purifying" the Anglican Church from all of its Catholic vestiges and returning it to what it was under Edward. Although not too much of a problem for Elizabeth, the Puritans caused many problems for her successors, the Stuarts.

Catholic Reformation

In the wake of the Protestant Reformation, the Roman Catholic Church responded intellectually with an examination of its doctrines and practices. While the Church had been battling heresy and criticism of its practices for the preceding centuries, the far-reaching force and

➤ IGNATIUS OF LOYOLA, FOUNDER OF THE JESUIT ORDER

Ignatius of Loyola was born in northern Spain in 1491 and began the process of progressive but dramatic conversion experience to Christianity when, in 1521, he was wounded in battle fighting against the French at the Spanish town of Pamplona. During the battle he was struck by a cannonball in the thigh, and his leg was severely broken. Because the French physicians attending him did not set the leg properly, it was necessary to break the limb a second time and reset it, without anesthesia. Loyola's condition deteriorated, and he suffered for many days with fever and pain. At one point, physicians told him that he should prepare for his imminent death. Yet his condition abruptly improved, and Loyola began passing the time reading about the life of Christ and the lives of the saints of the Church. It was the beginning of a process of deep spiritual discernment, something he described later in his work *Spiritual Exercises*. In 1522 while traveling in Spain, he experienced a profoundly moving vision on the banks of the Cardoner River. Although Ignatius of Loyola never revealed the specifics of this vision, he said that it was a significant and life-changing event that compelled him to found his new order, the Society of Jesus.

—Cheryl H. White

impact of Reformation thought took the institution by surprise. The intellectual foundation for the Protestant movement was laid before the movements of Martin Luther and John Calvin. Indeed, much of the opposition against the practices and teaching of the Church throughout the fourteenth and fifteenth centuries involved issues that served as the springboard for the Protestant movement of the sixteenth century. The Church attempted to institute its own reforms in a way that balanced some real change with a strong and conservative reaction to the teachings of Protestantism. This process of self-examination and calculated response to Protestantism is called the Catholic Reformation, or the Counter-Reformation, and refers to the rise of the Jesuit order (the Society of Jesus) and the convening of the nineteenth Ecumenical Council of the Church, the Council of Trent.

One of the important conservative reactions to the opposition against the Church was a movement known as the Society of Jesus, or the Jesuits, founded by Ignatius of Loyola. This order, recognized by Rome in 1540, was based on the reactionary idea that clergy should return to a model of strict obedience to the Church and its structures of authority. Loyola's own personal conversion experience in 1521 was a significant motivator for his movement, and he required absolute obedience from those men within the order. This began as a small movement, but by the middle of the next century it had over 15,000 members as it sought to renew universal Christianity in a way that would bypass local and regional politics that historically had interfered with the function of the Church. Because of its commitment to traditional teachings and the hierarchical structures of the Roman Church, the Society of Jesus was a significant manifestation of reaction within the Catholic Reformation.

From a theological perspective, the Jesuits highlighted what they believed to be a fundamental flaw within Protestantism—the teaching of predestination—and used this as a point of Catholic renewal. The Jesuits attempted to hold out the hope of salvation for all and in this way tried to strengthen the universal appeal of the Christian message. In order to reinforce and expand this message, the Jesuits helped to build universities and schools throughout Europe and undertook great missionary efforts in the New World. Because of their rapid expansion and influence, the Jesuits also became one of the most controversial groups of the age.

The Catholic Reformation is also characterized by aggressive measures against the followers of reformers like Luther and Calvin. The Holy Office of the Inquisition, established in the thirteenth century, expanded its control and jurisdiction in areas where the Church was still firmly rooted, such as Spain and France. The Church also used censorship as a means of suppressing Protestant teachings and writings, including the ongoing use of its Index of Forbidden Texts. In some areas, local bishops and prelates openly burned works by Protestant reformers.

The ongoing religious and political gains of Protestants in Europe resulted in the calling of the Council of Trent in 1545 by Pope Paul III. The

purpose of the council was to examine Protestantism and define Church teachings in response. The council met in three separate sessions that convened over an 18-year period (1545–1563). In the end, the Council of Trent advised some tangible and meaningful reforms of abuses, such as the sale of indulgences. The abuses widely apparent within the episcopacy (the office of bishop) were also reformed as a result of deliberations at Trent. For example, following this council, bishops would be required to live in the dioceses they presided over, and the practice of simony was also abolished. These reforms were needed to restore the Church's legitimacy as a spiritual authority within the secular world.

The Council of Trent was not without its own controversy. Although Pope Paul III endorsed the idea of a council to respond to Protestantism, not all of his successors shared his enthusiasm. This is one reason why the council spanned three separate sessions over 18 years but actually only met in session for less than 5 years. Francis I of France opposed the calling of the Council of Trent for fear that it would have political implications for the balance of power in Europe, and a succession of popes opposed it because they feared that it might symbolize a weakening of papal power in favor of the authority of a Church Council. Attendance at the sessions of the council was often small in number, and records indicate that Italian and Spanish bishops and prelates dominated the debate and discussion sessions. Nevertheless, the reforms that did result from Trent were significant for correcting abuses of practice that had once been the target of Protestantism, and Pope Pius IV finalized the council's decrees in 1564.

The Council of Trent failed to change official Church teachings on issues such as the Seven Sacraments, the literal interpretation of the Bible, and the authority of the pope. In the end, the Church reformed abuses but reinforced its own doctrines and theology in a way that offered little compromise with Protestants. The Catholic Reformation may have served in many ways to deepen the divide between Catholics and Protestants, for it reinforced the universality of its own tradition and scriptural interpretation and yielded little to Protestant thought on those divisive issues. Because the rapid and intense rise of

Protestantism in Europe forced the Roman Catholic Church into a position of self-examination and calculated response, it can be summarized that the Church's response manifested itself in both reasonable and reactionary ways. While meaningful reforms resulted from this process and the bold new Jesuit order emerged as a new Roman Catholic intellectual and scholastic force, many believed that the reforms came too late. Protestantism was already an unstoppable movement by the time of the Catholic Reformation.

Spanish and Portuguese Inquisitions

During the early modern era, European monarchs began making moves to centralize their power away from the nobles who had previously held much regional power during the medieval era. In the Iberian Peninsula, this was achieved by unifying people around their identities as Christians, and later as Roman Catholics, and by persecuting those who did not fit that image. The main institution that enforced these norms was the Inquisition, first established in Spain and later in Portugal. Popular culture has portrayed the Inquisition as a tool of the Counter-Reformation, a method of eradicating Protestants from the Iberian Peninsula. Rather, the Inquisition was a tool of the Crown to ensure royal hegemony over the noble class and the respective national churches.

The official history of the Inquisition in Spain begins with the Jewish population, or Sephardic Jews. The Jewish population of the Spanish kingdoms (Spain was not a unified entity until after the sixteenth century) had experienced persecution and discrimination throughout the medieval period. A forced conversion took place in 1381 in which thousands of Jews were converted to Christianity. However, despite their conversion,

► TORTURE AND THE SPANISH INQUISITION

Although the Inquisition is infamous for its methods of torture in order to extract confessions from the accused, in reality torture was used infrequently and was used only as a last resort. The instructions of 1484 sent to Spain permitted the use of torture on the accused, but the use of torture and the acceptance of confessions gathered after the use of torture were severely restricted. For instance, if the inquisitors decided to use torture, it could only be applied to the accused once. However, this was seldom told to the accused, and it was instead implied that the torture was only being suspended and would continue later if a confession was not obtained. In addition, a confession taken during torture was not

considered valid. Rather, the inquisitors were required to wait one day after the torture was applied for the confession to be ratified before it could be considered valid. Often, the inquisitors showed the accused their instruments of torture, which was usually enough to extract a confession. Before 1530 torture was very rarely used. After 1530 the numbers rose but stayed limited to cases of heresy, which was the minority of cases tried by the Inquisition. The amount of torture used by the Inquisition was not any more frequent than the amount of torture used by many other European courts of the time. Finally, in 1816, Pope Pius VII forbade the use of torture in any of its tribunals.

—Monique Vallance

they and their descendants were still not seen as true Christians, and they were therefore still worthy of suspicions as secret “Judiazers.” This matter was not helped by the fact that many of the more affluent *conversos* (as the converts were known) made use of their substantial resources to buy public offices and gain political power, something they were eligible for once they became Christians. This suspicion continued into the fifteenth century, and in response Fernando and Isabel applied to Pope Sixtus IV for an inquisition, which was granted to them on November 1, 1478. This was not unusual, as instances of heretical outbreaks often prompted requests for temporary inquisitions from Rome. What was different about this instance was that this Inquisition was a permanent one.

The Crown was given the control to appoint the inquisitors, something that was not done for two years. Finally, on September 27, 1480, Juan de San Martín and Miguel de Morillo, two Dominican monks, were appointed, and Juan Ruiz de Medina was appointed as their adviser. The Consejo de la Suprema y General Inquisición was then created in 1483. That same year, Tomás de Torquemada was appointed Inquisitor General of Aragon, Valencia, and Catalonia by papal bull. Tribunals were established across Spain in which torture was used in order to encourage the accused to confess their sins. Those who

confessed were allowed to do penance and released. Those who maintained their innocence and were found guilty were executed at ceremonies called autos-de-fé in which the people were burned at the stake. In the case of those accused who managed to escape the Inquisition, their effigy was burned instead. The Spanish Inquisition was most active until 1530 but would not be abolished until 1833.

In Portugal the situation was different. The persecution of Jews was not as blatant as it was in Spain; however, there also existed a community of *Cristãos-novos* (“New-Christians”), as conversos were called in Portugal, who were viewed with suspicion by the mainstream Christian community, especially since many had substantial financial resources and as the population had increased after the expulsion of the Jews from Castile and Aragon in 1492. King João III ascended to the throne in 1521 and set about reversing the policies of tolerance that his father, Manuel I, had established toward the New Christians. The situation finally came to a head after a significant earthquake hit Portugal in 1531, convincing many that the existence and tolerance of crypto-Jews in Portugal had incurred the wrath of God, thus causing the earthquake. Shortly after, King João III applied to Rome for an inquisition, to be set up in a similar manner to the one in Spain. This was not granted until 1536, as the

New Christian community had managed to send lobbyists to block the application, but it was only delayed. The king's brother, the Cardinal Henrique, was named the Grand Inquisitor, and tribunals were set up in Portugal as well as in Goa.

Both inquisitions had religious motives at the core: besides crypto-Jews, the inquisitions also had the authority to try those suspected of being witches, heretics, bigamists, blasphemers, and sodomites. In addition, the inquisitions used their religious authority to censure books that might contain any blasphemous materials, especially the works of people like Erasmus and Luther. Despite popular thought, neither inquisition prosecuted many Protestants, as the movement was not very large in the Iberian Peninsula. As far as the Crown was concerned, the inquisition also served as a tool to control the noble class. In addition, if the king was aware that a noble was to be apprehended by the Inquisition, he could either stop the arrest or give the accused sufficient warning so that he might escape. Those found guilty by the Inquisition were subjected to confiscation of their lands and fortunes by the Crown, creating an avenue of much-needed revenue that was especially important during the sixteenth century when both the Portuguese and Spanish empires were growing.

Despite the fact that both inquisitions were to be based on the same model, differences between the two became apparent after 1640. The Spanish ruled Portugal during 1580–1640, and when the Portuguese gained their independence, the inquisition worked against King João IV, as the Portuguese were Spanish and wanted to see Philip IV return to the Portuguese throne. This created a division between the inquisition and the Crown, and this, in addition to the work of Antonio Vieira, a Portuguese Jesuit who had sympathies toward the New Christians and disapproved of the Inquisition, resulted in the Inquisition being suspended in Portugal during 1676–1681 by Pope Innocent XI. The arrival of the Enlightenment slowed the inquisitions in both countries: the auto-da-fé was abolished altogether in the eighteenth century under the Marquis of Pombal in Portugal. However, neither inquisition would officially end, in either country, until the nineteenth century.

Ottoman Millet System and Religious Tolerance

Contrary to popular belief, the early Ottomans were not all Turkish Muslims. Rather, they were Turks and Greeks as well as Muslims and Christians. Like all early modern empires, they ruled over a religiously diverse population. In 1453 the Ottomans conquered Constantinople, the capital of the Byzantine empire and the seat of the Eastern Orthodox Christian Church. As part of their grand plan to refashion the conquered city into the Ottoman imperial capital, the sultan ordered the settlement in the city of Muslims, Christians, and Jews from different parts of the empire. This vision reserved a prominent place for non-Muslim communities, but the question was how to rule them. The Ottoman answer was to organize each into a largely autonomous communal group known as a *millet*.

Each millet consisted of the followers of an independent religious sect, such as Greek Orthodox Christianity or Rabbanite Judaism. The Ottomans recognized the top religious figure of each of these religious communities as the representative of his millet and held him responsible for the millet's obligations toward the government. For example, after establishing the number of Orthodox Christians in a town in Anatolia and surveying their land, the Ottoman officials would ask the head of the Orthodox Church to raise the required amount of tax from his millet. Each millet also maintained its own court system, in which it applied its own religious and communal laws without intervention from the

DEVSHIRME

The *devshirme* was the levy of slaves to serve as part of the Ottoman sultan's Janissary forces or the staff of the Imperial Palace. The exact start and end dates of the *devshirme* are unknown, but it is generally accepted among historians that it was most active between the mid-fourteenth and mid-seventeenth centuries.

The *devshirme* operated through conscripting young males from the empire's Christian populations, converting them to Islam, and subjecting them to a scrupulous program of physical and cultural training in Istanbul to prepare them for imperial service. Upon completing this program, some conscripts would join the ranks of the Janissaries as soldiers with the prospect of advancing to military leadership positions. Others would join the palace as administrators or as aides to the sultan. Here too they were groomed to occupy leading government positions including that of grand vizier.

Devshirme recruits were legally slaves of the sultan. However, they had the chance to amass immense power and authority because of their leading positions in the army and the palace and their special association with the sultan. In fact, until the mid-seventeenth century freeborn Muslims were in no position to match their influence, except those who rose in the ranks of the religious establishment.

—Omar Cheta

Ottoman imperial government. However, these courts were only permitted to rule on disputes between members of the same millet. For example, if two Rabbanite Jews disagreed over how much one of them owed the other, they were allowed to appear before a Rabbanite Jewish court. On the other hand, if the dispute was between a Jew and a Muslim, the Jew would have had no other choice but to appear before an Islamic court.

Interestingly, many non-Muslims preferred to go to an Islamic court even when their dispute was with a coreligionist. Their decisions were not necessarily deliberate acts of religious disobedience. More often, they were the result of practical concerns. By going to an Islamic court, a non-Muslim litigant was pursuing a court

ruling that was more likely to be enforced. Unlike millet-specific courts, Islamic court rulings were enforced through the mighty apparatus of the state. In addition, Islamic laws were often more lenient than those applied in non-Muslim courts. A prominent example is that of divorce. The Orthodox Christian tradition viewed marriage as a sacred matter and set very harsh conditions for divorce that made it practically impossible. Islamic laws, alternatively, viewed marriage as a contractual relationship that could be annulled at the request of either the husband or the wife as long as they fulfilled their contractual obligations (paying alimony by the man or giving up on financial rights by the woman).

Judging by the standards of the fifteenth century, the Ottoman millet system was remarkably tolerant toward religious minorities, especially when compared to the atrocities that Europe witnessed during the same time, such as the mass expulsion of Iberian Jews and Muslims. Nevertheless, the status of religious minorities was not ideal by modern standards. All was not equal before the law. Religion was the primary social marker in early modern Ottoman society. Social and legal hierarchies that favored Muslims over non-Muslims were in place. Significantly, some religious experiences, like conversion, could not be located within the generally tolerant model of the millet.

With the exception of the *devshirme*, the Ottoman empire did not force its non-Muslim subjects to convert to Islam en masse. However, for a variety of reasons, many Christians and Jews chose to convert to Islam. Some converted in order to escape the extra taxes that were levied exclusively from non-Muslims. Others converted in hope of career advancements. Since Islamic law prohibited the enslavement of Muslims, slaves occasionally chose to embrace Islam in order to free themselves. Likewise, because Islamic law forbade Muslim women from marrying non-Muslim men, women often converted in order to escape unhappy marriages.

While far and few between, instances of religious intolerance existed in Ottoman history. Interestingly, one of the most severe episodes did not primarily hurt non-Muslims. For most of the seventeenth century, a group of zealous Muslim preachers, known as the Kadizadelis,

spearheaded a popular puritan movement that tried to enforce strict codes of public conduct in Istanbul based on literal readings of Islamic texts. Significantly, their main targets were Muslim followers of Sufism, the mystical tradition of Islam. At the height of their influence and for a very short period, the Kadizadelis colored Ottoman policy toward non-Muslims. In the aftermath of the major fire that hit Istanbul in 1660, the Ottoman government refused to let the Jewish community rebuild its affected synagogues on their original sites.

Religious Fringe and Politics

With the onset of the Protestant Reformation and the reactionary Catholic Counter-Reformation in the sixteenth century, political and religious movements overlapped across much of Europe well into the late eighteenth century. At the international level, Catholic states such as Habsburg Spain fought to ensure the religious uniformity within their realms against the spread of Lutheranism and Calvinism. However, within the Protestant realms from England to northern Germany, Anglicans, Lutherans, and Calvinists fought to stamp out smaller fringe religious groups in tandem with their efforts

to eliminate Catholicism. Often these smaller groups would align themselves in political and intellectual institutions that advocated greater religious liberty in their efforts to dissuade persecution. Moreover, fringe movements within Catholicism, notably Jansenism, also contributed to political reaction against the French monarchy and its interpretations of Catholicism. In both instances, Protestant and Catholic states sought to impose both ecclesiastical and absolutist uniformity against religious fringe movements, which sought to maintain their political and religious autonomy.

Schisms between the Catholic Church and secular authorities had occurred since late antiquity, most notably over the issue of investiture (the appointment of bishops). The level of contention between Church and secular factions, especially in the context of the Babylonian Captivity and the Avignon Papacy, illustrated the level of division regarding the political authority of the Catholic Church over Christendom. However, with the onset of the Protestant Reformation in the fifteenth century, Catholicism developed a more reformist tone in regard to maintaining the ecclesiastical unity of its realms. Counter-Reformation Catholic institutions, such as the Inquisition, and orders, such as the Jesuits, were used to ensure ecclesiastic homogeneity and eradicate Protestantism. Institutionalized Protestantism, such as the state churches in England (Anglican), Scandinavia, and the northern Holy Roman Empire (Lutheran), as well as Swiss city-states such as Geneva (Calvinist) devised similar secular-ecclesiastical authorities to deal with their own Protestant fringe groups.

Fringe religious groups in Civil War England were mostly in the Parliamentary factions fighting against the Anglican Stuarts. Groups such as the Levellers, Diggers, Ranters, Fifth Monarchists, and Quakers, among others, dispersed their social and religious ideas among the Puritan ranks of Parliamentary forces. During the war they were able to gain adherents from English Puritans and Anglicans, as they all jointly faced the Stuart royalist forces. Parliamentary leaders, such as Oliver Cromwell, allowed for the existence of these factions amid the war, regardless of their demands in Parliament. Since they were integral to military forces, such as

➤ MUNSTER REBELLION (1534–1535)— ANABAPTIST THEOCRACY

After the Peasants' War in the Holy Roman Empire, the city of Munster became an Anabaptist stronghold amid persecution by Lutherans and Catholics alike. In 1534 several prominent Anabaptist leaders sought to establish theocratic rule over the city. The Dutch Jan Matthys deposed the city magistrates and designated himself as leader. Many citizens were rebaptized into the Anabaptist faith. Matthys was eventually deposed by John of Leiden (John Bockelson), who proclaimed himself king in the new "Zion." However, infighting among Anabaptists and siege by its expelled bishop led to the end of the short rule of Anabaptists over a major German city. Many of the leaders and adherents of the rebellions were subsequently tortured and executed by the returning authorities.

—Abraham O. Mendoza

Cromwell's crack troops in the New Model Army, they were mostly left alone. This allowed some of these groups, such as the Levellers and Diggers, to advocate greater religious and political freedom, through pamphlets and public engagements, than had been granted by the Anglican Stuarts. With Colonel Thomas Pride's expulsion of those who did not support the Grandees of the New Model Army from Parliament in 1648, an event known as Pride's Purge, the political agency of these groups, especially that of the Levellers, was effectively removed. In this manner, the Puritan leadership under Cromwell was able to seize power and impose religious uniformity throughout the English realm.

In the northern Holy Roman Empire, Protestant state persecution of non-Lutheran and non-Calvinist religious fringe groups, mostly the Anabaptists (those who practiced adult baptism), continued alongside the struggle against Catholicism, as these were viewed as heretical within their respective worldviews. In these circumstances, it was nearly impossible for the Anabaptists to acquire political power, as the secular authority in place was the only one granted legal right to do so for the populace as decreed in the Peace of Augsburg of 1555 (with Calvinists added in the Peace of

Westphalia). Lutheran and Calvinist princes and electors were as keen in stamping out Anabaptist movements as were their Catholic enemies. A short-lived victory for the Anabaptists was the establishment of a theocratic government in Munster in 1534 that was crushed the following year. During the Thirty Years' War (1618–1648), the persecution of fringe groups occurred on both the Protestant and Habsburg areas of control, as both sought to enforce religious uniformity in their lands.

In France, absolutist secular authorities were confronted by both Calvinist Huguenots and Jansenist Catholics for much of the period following the Reformation. Ecclesiastic uniformity, as enforced during the French Wars of Religion, eliminated Huguenot political authority to a significant degree. The Edict of Nantes of 1598 allowed the Huguenots some political rights, such as the right to fortify cities and to practice their faith in these urban centers. However, these rights were ultimately revoked with the Edict of Fontainebleau in 1685. This act led to many Huguenots migrating to Protestant regions in northern Europe and settler colonies in North America and South Africa. Jansenist Catholics, who were mostly aristocrats resentful of absolutist power gained at their expense, also flourished in France. Jansenists, who emerged as a consequence of theological deliberations in the early Counter-Reformation, believed in the concept of the elect, much like Calvinists, albeit within the confines of Catholic beliefs. Moreover, they were strongly represented in local courts, or parlements, that served as a means of resistance against Bourbon absolutism. Jansenist aristocrats, in their efforts to resist Bourbon encroachments on their withering power at the provincial level, developed ideas that would transcend well until the French Revolution.

Shia Islam under the Safavids

Safavid religious policy set Iran off from its powerful Sunni neighbors; at the same time, it began to shed its extremist *qizilbash* (literally “red head” in reference to the militant group’s red head gear) trappings. Immediately after entering Tabriz in 1501, Shah Esmail had announced that the official religion of his kingdom would be Shia—not the *gholat* (militant) Shia of the *qizilbash* but a more or less conventional Twelver Shia, to which he had probably been exposed while under the protection of Kar Kia Mirza Ali in Gilan. As indications of this, the names of the Imams were invoked in the Friday sermons and coins were stamped with Shia slogans. This promulgation of Twelver Shia in Iran was undoubtedly the most important and enduring of the Safavid accomplishments, but the problem of how and why it was done needs much additional study before it can be satisfactorily resolved.

It is often thought that Iran in 1500 was a predominantly Sunni country and that the transformation to Shia was accomplished by the threat—and at times definitely the application—of force. The change may actually have been not quite so dramatic as this implies. It should be remembered that the real bastions of Sunni Islam in central Asia were and remained outside the Safavid domain. Heterodoxy had long been common in western Iran, and many Shia communities and principalities are known to have existed there. Moreover, Shia, in the general sense of special affection for the family of the Prophet, had been deeply embedded in popular religion for centuries. There were aspects of Shia, notably its emphasis on legitimacy, that appealed strongly to Iranian sensibilities. The Safavids, for example, skillfully exploited the belief that the Imam Hosayn had married the daughter of the last shah of Iran, and that the later Imams—and the Safavid family—descended from this line. Ultimately, the application of this policy came down not so much to transforming the religious orientation of the Iranian population as to replacing Sunni ulama (religious authorities and jurists) with Shia ones, whom the populace would then follow. To do this, some were co-opted by the offer of material support, while others were imported from other Shia

communities (especially Bahrain and the Jabal Amil region of Lebanon); and those who resisted were either executed or, again in the words of Hasan-e Roumlu, compelled “to creep into corners to conceal themselves.”

In any case, the benefits to the Safavids of promoting Shia are fairly apparent. The appeal to Twelver Shia broadened the constituency of support for the Safavids; provided the Safavid ruler with an additional element of legitimacy as a descendant of the Imams; diluted the specifically Turkoman-*qizilbash* orientation of the state; created a juridical institution that owed its position, at least initially, to the will of the shah; and gave an ideological basis to the struggle with the Ottomans and Ozbeks. The costs are also clear. First, the injection of the Sunni-Shia schism into the wars and political struggles of the time thoroughly embittered relations between the two branches of Islam and led to bloody persecutions on both sides. Second, the Shia ulama soon consolidated an autonomous position and became potentially a threat as well as a prop to Safavid power, a situation remarkably similar to that of the Zoroastrian clergy in Sasanian times. This point is of such importance to all of subsequent Iranian history that it needs some special consideration.

It is a truism that there is no priesthood or church in Islam, but the Shia that developed in Safavid Iran can be said to have acquired the equivalent of both a powerful clerical class and a clerical institution. Many factors contributed to this. The Safavid rulers themselves gave a special recognition and hierarchical organization to the Shia ulama by establishing offices such as that of the *sadr* to oversee religious activities (even though the original purpose was undoubtedly to exercise control over the clerics). Involvement in the administration of charitable endowments (*waqf*), including substantial properties donated by Safavid aristocrats, and the collection of certain religious tithes and fees provided the ulama with a largely independent source of funding. The juridical tasks performed by the ulama required an advanced education and knowledge of Arabic that would of necessity distinguish them from the ordinary Persian- and Turkish-speaking masses. Since the Safavids were suspicious of other Sufi orders, Sufism in

➤ CURSING THE CALIPH

It is common practice among many Shiites to ritually curse and defame some companions and relatives of the prophet Muhammad. They are those who pushed aside the claims of the only legitimate successor of the prophet Muhammad, Ali Ibn Abi Talib, or even raised arms against him. In particular, they are the first three caliphs: Abu Bakr, Umar, and Uthman, but also Aisha and Ali's enemies in the battle of the camel (656) and, finally, his adversaries Muawiya (governor of Syria) and Amr ibn al-As, who voted against Ali in the famous arbitration of Adhruh, are openly denounced. However, all of those are venerated by pious Sunnis, while Shiites consider them enemies of Muhammad. As such, they are cursed on ceremonial occasions and prayers. The act is called *tabarra* (to reject or abandon) and was introduced by the Fatimid caliph al-Hakim (985–1021). The Safavid ruler Shah Ismail (1487–1524) made the cursing of the first three

caliphs mandatory during Friday sermons and rigorously enforced it, threatening to kill anyone who did not oblige. At times, effigies of Umar or Yazid bin Muawiya, who is seen as the murderer of Hussain bin Ali and his family, were burned during institutionalized ritual cursings. Today it is customary to disassociate with the enemies of Muhammad, but the cursing is not mandatory. Sunnis, however, still consider this a sacrilege, and it is a major obstacle for improving inner-Islamic relations.

Iran provided neither the alternative to Shia nor the focus of popular religion that it did in Sunni states. Great clerical families tended to monopolize religious positions for generations, and their position was further buttressed by marriage and kinship ties among them. Many claimed to be descendants of Imams themselves and thus to have a special status and legitimacy of their own.

Their authority ultimately derived from their knowledge of Shia law, and they had no particular reason to attach special importance to the role of the Safavid shah as either the spiritual guide of a Sufi order or the charismatic leader of the qizilbash. Finally, they developed an ideological basis for their authority that owed nothing to the Safavid ruler: In the absence of the “hidden” Twelfth Imam, questions about religious conduct must be decided on a continuing basis by scholars (*mojtaheds*) trained in jurisprudence and juridical methods (*feqh* and *osul-al-feqh*) and sufficiently advanced to exercise independent judgment (*ejtebad*). Ordinary believers were obliged to consult a mojtahed and “imitate” his example, a practice known as *taqlid*. This idea did not develop at once, and there was considerable opposition to

it within Shia, but once it was established it conferred great influence and authority on the top members of the clerical establishment. Mojtaheds typically came to control a patronage system with considerable financial resources and to extend their influence over whole sections of the country through a network of lower-ranking *mollas* orakhounds.

The trend toward greater clerical influence was noticeable as early as the reign of Shah Tahmasp, when there are reports of religious dignitaries who consorted on familiar terms with the shah, who interfered in the running of the government, and whose requests, whether for material benefits or specific actions, were inevitably granted. According to one famous story, the Imam Ali appeared to Tahmasp in a dream in 1532, after which Tahmasp “repented” of drinking wine and his other vices, and he issued a number of puritanical regulations on public conduct. This was almost certainly evidence of the influence the Shia mojtaheds were beginning to have on the court and a tacit recognition that the shah was no longer a spiritual guide beyond reproach, but was bound by traditional religious law and convention.

The late Safavid era was also the period when the problem of excessive clerical influence became most severe. It is said that Shah Abbas had allowed one mojtahed to address him as “founder of a borrowed empire” and as a sign of humility walked on foot in front of another mojtahed riding through the main square of Isfahan. He had certainly spent lavishly to refurbish Shia shrines and create charitable endowments, and he made a great show of visiting religious centers like the tomb of Imam Reza, on one occasion traveling the whole way from Isfahan to Mashhad on foot and carrying out such menial tasks as cleaning the mosque and trimming the candles. In the case of Shah Abbas, such actions were probably intended only to cultivate the mojtaheds through the use of flattery and financial rewards and to create the impression of piety on his part. Later Safavids, however, were quite clearly subservient to clerical interests. The notoriously timid and superstitious Shah Soltan Hosayn (1694–1722), for example, was thoroughly dominated by the ulama. The great Shia jurist Mohammad Baqer Majlesi (d. 1699) held the top clerical post (then called *mollabashi*) and encouraged the shah to persecute both non-Muslims and Muslims he considered heretical. Ironically, one of the chief targets of this new intolerance was what Majlesi called the “foul and hellish growth” of Sufism, the very form of religion the Safavids had originally championed, and which constituted the bedrock of their movement. Implicit in these developments was the notion that the mojtaheds, not the shah, acted as representatives of the Hidden Imam, and that the shah was at best an executive agent on their behalf.

Mughal Religious Policy—Akbar and Jahangir

No aspect of Mughal history has received as much attention or generated as much controversy as religious policy. Indian nationalist historians like A. L. Srivastava and S. R. Sharma praise Akbar's policy of religious pluralism and regard it as a precedent for the contemporary secular state of India. Orthodox Muslim historians like I. H. Qureshi and K. A. Nizami condemn Akbar as an apostate and persecutor of Muslims and regard his policies as fatal to the empire in the long run. This disagreement echoes the chroniclers of Akbar's time. Akbar's official biographer Abu'l Fazl regarded his master's religious initiatives “as the foundation of the arrangement of mankind,” while a critic at that time, `Abd al-Qadir Bada'uni, considered Akbar a false messiah. This bitter rhetoric inevitably masks a complex and nuanced reality that matches neither of these opposing narratives.

The legitimacy of traditional monarchs depended in part on their status as the champions, or at least supporters and guardians, of a specific faith. Akbar's Timuri predecessors were Sunni Muslims and ruled as Sunnis. Akbar promulgated the concept of *sulh-i kull* (literally “peace with all,” meaning religious pluralism) as the ruling religious principle of the empire. Akbar's elimination of the *jizya*, the capitation tax paid by non-Muslims to Muslim regimes to indicate their subordinate status, in 1579 fundamentally altered the constitutive principles of the empire. Loyalty and subordination to the ruler, not sectarian affiliation, defined a person's status. Akbar settled on this concept after more than two decades of experimentation. The concept reflected three main considerations: Akbar's inability to win the support of the Indo-Muslim intellectual and cultural elite; the need to secure the active, or at least passive, support of the numerous local potentates and their military followers; and Akbar's personal disdain for religious particularism.

The leading ulama (Muslim religious scholars), Sufi sheikhs (leaders of Sufi orders), and men of letters of Indo-Muslim society had developed close ties to the Afghan dynasties that had ruled the northern subcontinent for most of the

THE DIN-I ILLAHI

The Din-i Illahi, literally the divine faith, was a religious order founded by and focused upon Akbar. It was not, as historians hostile to Akbar have claimed, an attempt to found a new religion that would supplant Islam. It was not a mass movement; Akbar never attempted to propagate the Din-i Illahi beyond a small circle of high-ranking officers. There may have been no more than 11 members.

The Sufi term *muridi* (“discipleship”) defined the relationship of the adherents of the Din-i Illahi to Akbar. Their sovereign was also their spiritual guide. Akbar’s biographer and ideologue Abu al-Fazl asserted that spiritual guidance is an inherent part of kingship. The ritual of initiation resembled similar rituals in Sufi orders. The initiates—all but one of them were Muslims—swore an oath to abjure “traditional and imitative Islam” and devote their “property, life, honor and religion” to Akbar. They wore a token bearing the inscription “Allahu Akbar” (“God is great” or “God is Akbar”) and greeted each other by saying “Allahu Akbar” and responding “Jalala Jalahu” (“may his glory be glorified”; Jalal al-Din was another component of Akbar’s name). These practices offended pious Muslims but did not constitute public apostasy from Islam. Ultimately the purpose of the order was to ensure political loyalty, not to alter religious faith.

Although most historians associate the Din-i Illahi with Akbar exclusively, Jahangir continued to act as a spiritual guide for some of his officers. Shah Jahan ended the practice.

—Douglas Streusand

previous century and a half. With the exception of the leaders of the Chishti Sufi order, the Indo-Muslim cultural elite rejected Akbar’s efforts to establish connections with it in the early 1560s. As a result, Akbar turned away from the Muslim establishment as a source of political legitimacy. He abandoned the traditional capital of Delhi at this time as well.

Even before his break with Delhi, Akbar had developed a connection to the Chishti Sufi order. The Chishtis were among the most prominent Sufi orders in southern Asia but their universalist approach separated them from the Muslim

mainstream. Chishtis studied under Hindu masters and accepted Hindu students. Akbar made his first pilgrimage to the shrine of Mu`in al-Din Chishti at Ajmer in 1562 and traveled there ten times in the next 15 years. He also attended the living Sheikh Salim Chishti at Sikri in 1569 seeking intercession for the birth of a son. Two sons were born there during the next two years, and Akbar began construction of new capital complex, Fatehpur (City of Victory) at Sikri. The association with the Chishtis reflected Akbar’s universalist instincts and rejection of the mainstream Muslim establishment.

Northern India held an enormous pool of military manpower, much of it in the form of peasant soldiers. Most of them gave allegiance to local or regional potentates, who varied from small landlords with armed bands to rulers of substantial principalities. The majority of them were Hindu. The expansion and governance of the empire required the absorption, or at least the neutralization, of this military potential. Previous Muslim rulers had frequently accepted Hindu lords as subordinate allies but had rarely been able to establish durable relationships, at least in part because of Muslim objections. Akbar’s Rajput alliances, beginning with Rajah Biharh Mal Kachwaha of Amber in 1562, thus did not establish a new pattern, but their durability did. Akbar’s disregard for Muslim sensibilities facilitated his incorporation of Rajputs and other non-Muslims into the Mughal ruling class. Akbar’s promulgation of *sulh-i kull* made this policy official.

In 1578 Akbar began a series of discussions with Sunni and Shia Muslim, Hindu, and Christian intellectuals in the Ibadat-Khana (literally “house of worship”) at Fatehpur Sikri. He found the Muslim ulama who participated in these discussions dogmatic and petty and resented both their ideas and their control of much of the revenue of the empire in the form of land revenue grants. His response to this situation began the articulation of his mature religious policy. At the suggestion of Sheikh Mubarak Nagawri, a close adviser and the father of Abu al-Fazl, Akbar ordered the promulgation of the *mahzar* (“decree”) frequently but inaccurately called the Infallibility Decree. The *mahzar* designates Akbar as a *muftabid* (one qualified to issue

independent legal rulings) and, with various titles, the divinely mandated ruler of the Muslim community. Its words imply that he intended to act as the ruler and lawgiver for the Muslim community. He and his close advisers, however, apparently intended it to establish his position above and independent of the traditional ulama and thus free him to articulate *sulh-i kull* as the basis of his religious policy as well as to justify Akbar in asserting control of revenue grants to ulama. At roughly the same time, Akbar stopped participating in Muslim public rituals.

Akbar thus used the *mahzar*, which declared his status as the highest Muslim authority, as a step toward removing himself from the public category of "Muslim." Abu al-Fazl explains that "Among monarchs, divine worship is expressed by their justice and good administration." But Akbar moved only as far as ambiguity. He never explicitly apostatized from Islam, never presented himself as a prophet or messiah, and never attempted to start a new religion, contrary to the charges of many of his critics. His use of such phrases as "Allahu Akbar" (meaning "God is Great" or "God is Akbar") on coins and elsewhere hinted at messianic or prophetic claims but did not state them. Bada'uni asserted that Akbar wanted to substitute that phrase for the Muslim profession of faith, but he never tried.

Akbar's critics contend that he oppressed traditional Muslims and sought to replace Islam with a new religion and that his policies led to the major revolts in Bihar and Bengal during 1580–1582. The oppression consisted of no more than depriving Sunni ulama of land revenue grants, which was a matter of administrative centralization, not persecution.

The concept of *sulh-i kull* and the elimination of the privileged status of Muslims that it implied altered legal and governmental practices in the provinces as well as at court but did not provoke widespread resentment. Religious issues had little to do with the revolts in the eastern provinces; the rebels resented not Akbar's religious policy but his efforts to reduce the autonomy and increase the accountability of his officers. Later in Akbar's reign, Sheikh Ahmad Sirhindi (1564–1624), known as the Mujadid-i Alf-i Sani (the reviver of Islam in the second millennium), vigorously opposed Akbar's religious

policy, especially the elimination of the *jizya*. The critics also argue that the accession of Jahangir represented a return to orthodoxy and that he won the support of the majority of officers for this reason. Historians such as Sayyid Athar Abbas Rizvi and J. F. Richards have convincingly refuted this interpretation, showing that Jahangir continued Akbar's religious policy with little change.

Mughal Religious Policy— Shah Jahan and Aurangzeb

Akbar and his great-grandson Aurangzeb can appear as polar opposites, representing the two extremes of Islam in South Asia. Just as Akbar is a hero to secular Indian nationalists, Aurangzeb is a villain whose bigoted policies caused the decline of the empire. Just as Muslim historians condemn Akbar, they praise Aurangzeb for his piety and argue that he did his best to save an empire that Akbar had doomed. There is little doubt that, personally, Aurangzeb was a pious Muslim with no sympathy for Akbar's religious universalism. But his religious policy was neither as extreme nor as politically significant as most historiography suggests.

The movement away from Akbar's policy of religious pluralism actually began with Aurangzeb's father, Shah Jahan. Although he made no explicit announcement, Shah Jahan altered religious policy in four significant ways. He adjusted court rituals in accord with Muslim sensibilities and took measures to prevent the marriage of

Muslim women to Hindu men, an issue that had concerned most Muslim rulers in India before Akbar. For a time Shah Jahan enforced the Mughal Shari`a prohibition on the construction of new non-Muslim places of worship and ordered the demolition of Hindu temples built in defiance of the ban. Shah Jahan also ended the practice of acting as a spiritual guide to some of his officers. Shah Jahan was thus much more sympathetic to the attitudes and concerns of orthodox Muslims and presented himself personally as a pious Muslim, but he did not abandon his grandfather's (Akbar's) concept of *sulh-i kull* ("peace with all") entirely. The ban on temple construction did not last long.

In their personal religious views and conduct, Dara Shukuh and Aurangzeb, Shah Jahan's eldest and third sons, symbolize the universalist and particularist extremes among South Asian Muslims. Thus, historians traditionally have construed the struggle between them to succeed Shah Jahan on the throne as a struggle between universalism and particularism. This image is not accurate. Although Aurangzeb did emphasize his Sunni piety against Dara's universalism (and the Shia allegiance of the second son, Shah Shuja), he did not lead a particularist party. The struggle for the throne was personal, not ideological, and the supporters of both participants included officers of all ethnics and backgrounds. There is no indication that Hindus or Shias regarded Aurangzeb's Sunni rigor as a threat.

During the first ten years of his reign, Aurangzeb made a number of adjustments in court and governmental practices in accord with his Muslim sensibilities. This process included the elimination of the Muslim profession of faith on coins on the grounds that they would be defiled by the touch of non-Muslims. He also ended the Mughal celebration of the Iranian spring holiday of Nauruz, which Muslim rulers had observed since Abbasid times. He ended musical performances at court, the patronage of musicians, and several syncretic court rituals established by Akbar. None of these measures addressed *sulh-i kull*, and all of them except the last addressed what had been standard practices among Muslim rulers long before Mughal times. More substantively, Aurangzeb decreed in 1665 that Hindus pay internal customs dues at twice

the rate of Muslims and ordered the dismissal of Hindus in provincial government services (Hindu officers continued to serve in imperial service). These measures inevitably provoked resentment, although most Mughal officers did not enforce them rigorously. Some did, but in at least one case Aurangzeb dismissed a judge for oppressing Hindus in his jurisdiction. He clearly did, however, provide positive incentives, such as promotions, robes of honor, and cash awards for conversion to Islam.

The image of Aurangzeb as a persecutor of Hindus as well as a pious Muslim rests on two measures: the destruction and desecration of Hindu temples and the reimposition of the *jizya*. The latter measure was a tax imposed on all non-Muslims who were male, who were of age to serve in the military, and who earned an income. Richard M. Eaton's recent study of temple desecration reveals that Aurangzeb did not deviate from the pattern of earlier rulers. There was no wholesale destruction of temples; Mughal forces destroyed temples only in newly conquered areas or where rebellions had taken place and targeted only those temples that represented the hostile rulers or rebels. The intent was political, not religious; the temples were destroyed as political symbols, not places of worship. The reimposition of the *jizya* in 1679 reflected Aurangzeb's convictions and served no positive political purpose; it is unclear whether the tax even added significant new revenue. One source indicates that he took this action against the advice of many of his leading officers. The announcement of the decree caused riots in Delhi, and the collectors of the tax, at least in the first years, encountered widespread passive resistance.

Aurangzeb made Islam the sovereign faith of the empire and made the subordinate position of Hindus clear. These measures and his support for conversion to Islam attested to his desire to establish a thoroughly Muslim polity. There was not, however, systematic persecution of Hindus or any systematic or deliberate effort at mass conversion. Aurangzeb's policies essentially returned to the situation that had existed in Muslim principalities in South Asia before Akbar's innovations, with one important exception: Hindu officers remained in Mughal service and continued to hold high ranks. There was neither

► TEMPLE DESECRATION

The image of the destruction of Hindu temples by Muslim armies has had enormous effects, cultural as well as political. Such destruction provided the basis for one of the great early mystery novels, Wilkie Collins's *The Moonstone*, and affects the contemporary politics of South Asia, as illustrated by the destruction of the Babri Mosque at Ayodhya by Hindu nationalists in 1992 on the grounds that Muslims had built it on the site of a temple that they had demolished. Recent scholarship, however, has demonstrated that the popular notion that Muslim rulers systematically desecrated and destroyed Hindu temples because their iconoclasm demanded the destruction of idols is a myth.

Muslim rulers did destroy Hindu temples but not systematically, not out of iconoclasm, and only in specific political contexts. Hindu rulers destroyed temples in some cases as well. Temple destruction was a matter of politics, not of iconoclasm or religious persecution.

With the establishment of the Delhi sultanate, Muslim rulers moved into a region in which temple destruction was a normal part of warfare. From the sixth century onward, Hindu rulers built and maintained monumental temples with icons that articulated their sovereignty. The looting or de-

struction of such temples became a regular element of warfare between Hindu regional rulers of such dynasties as the Chalukyas, Chandellas, Rashtrakutas, Cholas, and Pratiharas. The Delhi sultans and later Muslim rulers (including the Mughals) continued this pattern; their behavior did not differ markedly from their Hindu predecessors and contemporaries.

As a general rule, Mughal rulers destroyed temples associated with leaders of conquered Hindu principalities or rebellious Hindu officers. Shah Jahan and Aurangzeb continued this practice and did not fundamentally alter it. Shah Jahan, for example, ordered the destruction of the great temple at Orchha, which the family of the rebel Raja Jujhar Singh had patronized, during the suppression of Jujhar Singh's rebellion in 1635. Aurangzeb ordered the destruction of the Vishvanath Temple in Varanasi in 1669 in response to a local uprising in that region and because he suspected one of its chief patrons, Raja Jai Singh, of complicity in the escape of the Maratha leader Shivaji earlier in that year. The next year Aurangzeb ordered the destruction of another major temple, the Keshava Deva temple at Matura, during the suppression of a Jat rebellion in that region.

—Douglas Streusand

a systematic effort to remove them nor a general exodus of Hindu officers.

The greatest historiographical controversy concerns not Aurangzeb's actions and intentions but their effects on the empire. Both British and Hindu nationalist historians, most notably Jadunath Sarkar, have argued that Aurangzeb's religious policies facilitated the empire's downfall. Sarkar argued that Aurangzeb's policies provoked a series of revolts that exhausted the imperial finances. Although Sarkar's classification of the Maratha Wars as a revolt is open to question, the conflicts that Sarkar references did take place and did lead to the collapse of the Mughal political and financial structure. What is not clear is that Aurangzeb's religious policies caused them. The most important, the struggle against the Marathas, took an ideological color in 1674 when the Maratha leader

Shivaji proclaimed himself a Hindu sovereign. Yet the best current authority on the Marathas, Steward Gordon, argued that Shivaji sought primarily to strengthen his position as Maratha ruler. The war continued because of Aurangzeb's determination to force the Marathas to accept a subordinate position in the Mughal system, not for a religious or ideological purpose. Thus, Aurangzeb's religious policy cannot be blamed for the challenges and problems faced by the Mughals.

Trading Guns for Religion— Anti-Christian Policies in Tokugawa Japan

Because it perceived Christianity as a threat to its control of the state, in the seventeenth century the Tokugawa Shogunate adopted a series of anti-Christian policies, which in 1639 largely cut Japan off from the outside world. Theoretically, Christian ideology challenged supreme loyalty to the shogun, and there was concern that ambitious regional leaders might use religious connections to gain foreign support against the central government. Anti-Christian edicts passed between 1612 and 1616 called for the expulsion of foreign missionaries and required that Japanese register with local Buddhist temples. This was followed by a period of violent persecution of Japanese and European Christians. Between 1633 and 1639 a series of exclusion acts forbade Japanese to travel abroad and ordered regional governors to seek out Japanese converts and European missionaries in hiding. The last of these edicts forbade Portuguese traders from entering Japan. Although Dutch traders, who were

interested only in commerce and not conversion, were allowed to continue a strictly controlled trade with Japan following the 1639 edict, policies aimed at wiping out Christian influence almost completely closed the country to the West.

The Tokugawa Shogunate inherited the anti-Christian policies of the previous political system when it consolidated power in 1603. The sixteenth century had seen increasing Portuguese trade in Japan, accompanied by the missionary activity of Portuguese Roman Catholic priests. In the years immediately preceding the Tokugawa period, as much as 2 percent of the population of Japan had been converted. The previous regime had restricted the practice of Christianity and ordered the expulsion of missionaries in 1587, and the first violent persecution of Japanese converts took place in 1597. Although the Tokugawa Shogunate was eager to encourage lucrative foreign trade, concern about Christianity remained. During the early Tokugawa period, Protestant Dutch and English traders reinforced Japanese fears about Catholic missionaries and offered trade without ideology. This led to more aggressive policies against Catholic Christians.

The first series of anti-Christian edicts called for trade restrictions and the expulsion of foreign missionaries. The first decree prohibited Christianity and was followed in 1614 by an order for the expulsion of Japanese and foreign Christian missionaries from the country. The 1614 edict made Buddhist temples part of the official

► THE SHIMABARA REBELLION

The Shimabara Rebellion, a peasant uprising that lasted from the winter of 1637 to the spring of 1638, was the catalyst for a policy that effectively cut off Japan from the West. The immediate cause of the rebellion was probably the harsh tax-collection practices of the local government. Once started, the insurgency took on a religious character, with peasants carrying banners praising the Holy Sacrament of the Eucharist. In January 1638 an estimated 20,000 to 38,000 peasants took control of Hara Castle. The rebels successfully repelled the attacks of as many as 100,000 men mobilized by order of the shogunate. Dutch traders demonstrated their

support for the shogunate by firing on the castle from the sea. The insurgency was finally crushed in April when the surrounded rebels ran out of food and gunpowder. All of the peasants, including women and children, were massacred by government forces after the castle was stormed. Tokugawa officials believed that the uprising had been religiously motivated and suspected foreign missionaries of stirring up and supporting the rebellion. This confirmed long-held fears about Christian subversion, especially that of the Catholic Portuguese, and led to the “closed country” edict of 1639.

—D. L. Barnes

anti-Christian movement by requiring that all Japanese in Tokugawa's immediate domains register with their local Buddhist temple, which would keep records for the central government. In 1616 the shogunate restricted foreign trade to the port cities of Nagasaki and Hirado.

These edicts were followed by a period of religious persecution in Japan. It has been estimated that 750 Japanese Christians were executed in the period between 1613 and 1626 and that thousands more died in prisons or in exile. Foreign Christians were executed for the first time in 1622. By 1625, Christian practices had largely been wiped out or driven underground.

The second series of anti-Christian policies, announced between 1633 and 1639, aimed at cutting off Christian influence by forbidding travel abroad and closed the country to most trade from the West. These *sakoku* ("closed country") edicts also instructed the governors of Nagasaki to intensify the search for Christian converts and foreign missionaries who were in hiding or were being smuggled into Japan on trade ships. A peasant uprising in Shimabara, believed by the shogunate to have been fomented by foreign Christians, stoked long-held fears of foreign intervention and religious subversion. In an attempt to shut out all Christian influence to Japan, the final *sakoku* edict ended nearly a century of trade with the Portuguese and banned Portuguese ships from the country.

In 1640 the Portuguese sent a ship to request a repeal of the ban. In response, 57 members of the crew were beheaded, and the ship was burned for violating the edict. Thirteen of the crew members were spared to report on the fate of their shipmates. In the same year, the Office of the Inquisitor was established to centralize the search for underground Christians throughout Japan. Suspected Christians were tested, often by being made to trample on a religious image, and tortured. After 1639, only Dutch and Chinese traders were allowed to remain in Japan. Even the Calvinist nonproselytizing Dutch inherited the suspicion, which had been initially directed at the Roman Catholic Portuguese and were confined to the man-made island of Deshima. These traders remained Japan's sole contact with the West for more than 200 years.

Toleration, the Career of a Concept

When the United States ratified the Bill of Rights to the nation's Constitution in 1791, supporters hailed it as one of the great marks of the Enlightenment's push for greater toleration. After all, the First Amendment provided freedom of religion, speech, press, assembly, and petition to American citizens. By the time of the Bill of Rights, serious debate in Europe over notions of religious toleration had been circulating for several centuries, since the time when the Protestant Reformers, such as Martin Luther, John Calvin, and Ulrich Zwingli, and their forerunners John Hus and John Wycliffe first leveled their charges and mounted their attacks against the Catholic Church, an institution that had enjoyed a near-monolithic hold on the religious values and practices of Europe for a millennium. During the intervening years, critics and supporters of toleration arose based on varying factors.

One of the major issues concerning toleration involved the very connotations of the term, which can be defined as acknowledgment, if not acceptance, of cultural, social, and religious differences by a society's dominant or majority group of that society's minority group or groups. Some people criticized the idea of toleration because they considered it a negative move away from a faith in moral absolutes. Others did not like the concept of toleration because they believed that it would provide either an implicit or explicit provision that some groups are able to determine what other groups are allowed to believe and how those groups are allowed to act. In contrast, some people supported notions of toleration because they believed it to be positive, allowing for a more

➤ EDICT OF NANTES

Issued under Henry IV in 1598, the Edict of Nantes was an attempt to bring religious settlement to France after the French Wars of Religion wracked the country with intermittent warfare between Catholics and Huguenots (French Calvinists). Beginning in 1562, these wars were predicated on two major factors: the number of Huguenots, who had strong support from some members of the French nobility, and the lack of strong leadership after the death of Henry II, leading to dynastic struggles of the Valois dynasty. The Wars of Religion came to a close with Henry IV's ascension to the throne, after which he renounced his Protestant faith and attended mass, despite having served as the leader of the Huguenots. He then gained back Huguenot support with the Edict of Nantes, which provided them with liberty of conscience and certain political concessions. Neither Catholics nor Huguenots were particularly pleased with the terms of the edict, but the competing factions realized that it was a matter of practical reality rather than what either group wanted. Wary of the political challenges that Huguenots could pose to his absolutist policies, Louis XIV revoked the Edict of Nantes with the Edict of Fontainebleau in 1685, leading to some 200,000 Huguenots illegally fleeing the country.

—Christopher C. Strangeman

open approach to diversity, while others accepted toleration because it did not mean acceptance of other beliefs or actions, just acknowledgment those beliefs or actions existed.

Historians almost all agree that it was probably the period of the Reformation—because of the competing claims for toleration, or lack thereof—that was the most virulent time of European history for intolerance and bigotry. For instance, Michael Servetus was put to death in Geneva in 1553 solely for his religious beliefs, considered by John Calvin to be dangerous heresy. Nevertheless, the issues of toleration were present before that in such events as the Crusades, with the wanton actions of some Crusaders against European Jews and Muslims and the Catholic Church's actions to eliminate the heresy of the Albigensians (Cathars); the varying forms of the medieval Inquisition; and the

Reconquista in Spain, with the forced expulsion of Jews and Muslims.

Following the Reformation, issues of toleration broadened to follow the state-building process of the various European nations, usually along either an absolutist or constitutionalist model. In these models, historians typically take either France or England as the leading examples. For instance, in France, Louis XIV's drive for absolutism erased the modest (though politically and practically inspired) gains following the French Wars of Religion as he revoked the Edict of Nantes, wary of the possible political power of the Huguenots. In contrast, after the Glorious Revolution in England, which ousted the Catholic James II for the Protestant William III, Parliament issued a Bill of Rights and a Toleration Act. In addition, John Locke published two works that would help lay the foundation for theories of toleration under constitutionalist governments with his *Letter Concerning Toleration* and his *Two Treatises of Civil Government* (particularly the Second Treatise, originally thought to be written in justification of the Glorious Revolution). Even in the case of the more constitutionalist England, however, Roman Catholics were excluded from holding state office and did not gain official emancipation until 1829. Though England and France are usually taken as the models for the issues of toleration following state building, it was almost certainly the Netherlands that enjoyed the greatest degree of toleration in early modern Europe. In addition, Poland, long harboring a large Jewish population, issued an early toleration act with the Warsaw Confederation in the later sixteenth century.

Largely as a reaction to the absolutist policies of Louis XIV and his heirs, the proponents of the eighteenth-century Enlightenment, including the French philosophers Voltaire and Denis Diderot, championed the cause of religious toleration. They held out the abuses and absolutist attitudes of the Catholic Church as their avowed enemy, perhaps best evidenced by Voltaire's defense of Jean Calas in the infamous Calas Case. The Enlightenment's push for increased toleration reached across Europe and to the United States, where the founding fathers may have seen the greatest expression of the movement with the addition of the Bill of Rights to the U.S. Constitution

and where Thomas Jefferson produced the Virginia Statute of Religious Freedom. Often seen as climaxing with the French Revolution, the Enlightenment helped widen the cause of toleration from more narrowly focusing on religious concerns to focusing more on broad-based notions of intellectual freedom in Western society.

Sacred and Secular Authority in the West, 1500–1789

On the eve of the Reformation, Church and state relations were worked out within the context of a unified theory of Christendom. The papacy's claim to direct the affairs of the West through priestly power exercised "by reason of sin" was disputed but not ignored. Rulers paid the papacy lip service as long as they controlled ecclesiastical patronage. Conciliarist sentiment, especially in the form of French Gallican criticism of papal pretensions and calls for a general council to restrict the powers of the Roman Curia (the papal court), also weakened Rome's power on the European stage. These factors made the popes increasingly focus their energies on building up a state in central Italy from which revenues could be drawn to support the Curia. The wars fought by Pope Julius II (r. 1503–1513) to expand this state were criticized by Erasmus as anti-Christian, and the pope's exactions through the sale of indulgences to pay for rebuilding St. Peter's were resented in Germany and elsewhere. His maneuvers also led Louis XII of France to support a rebel council at Pisa (1511). Julius convoked the Fifth Lateran Council (1512–1517) in reply, but no substantial changes in the status quo were effected. Local issues, like lay resentment of clerical immunities from taxation

and the jurisdiction of lay courts, also contributed to resentment of ecclesiastical power.

The outbreak of the Reformation, beginning in 1517, led to a fracturing of Western Christendom. Mainstream reformers like Martin Luther, whether dealing with princes or cities, emphasized the power of lay rulers over the clergy. The magistrate was seen as able to impose reform and maintain discipline. In many cases, even in Calvin's Geneva, reformed clergy had to give way to lay opinions in disputed matters. The papacy lost its role in England, Scandinavia, and much of the Holy Roman Empire. Even Catholic rulers claimed control over ecclesiastical affairs. Most notably, the clergy in Spain and its colonies were controlled by the Crown and its bureaucrats. Even the enforcement of orthodoxy through the Spanish Inquisition was in the hands of royal servants. The French Crown governed its relations with Rome through a concordat, or diplomatic pact, negotiated by Francis I in 1516. This gave the Crown a great deal of local power until the kingdom fractured along partisan lines. Huguenot Protestants, whose theological impetus came from Geneva, became political players, frequently resisting royal authority. Their power was contested not so much by the Crown, which was weakened by a series of feeble kings, but rather by the Catholic League, conservatives led by the House of Guise. The internal struggles between Catholics and Protestants were exploited by other powers, especially Spain, to weaken France. Whichever faction was in power inspired the other group to write works justifying resistance to royal authority. In reaction, certain political theorists, called "politiques," argued for strengthening the Crown as a means of overcoming factional conflict.

The revolt of the Netherlands against the Spanish Crown created a Dutch polity that strove to resist Habsburg arms while protecting Protestant interests. This Dutch milieu eventually became a locus of religious tolerance, which extended even to Jewish populations expelled from the Iberian kingdoms. In contrast, Spain expelled religious minorities, beginning with the Jews in 1492. *Conversos*, or converts from Judaism, were scrutinized closely out of fear that they retained their old religious loyalties. So too were converts from Islam. In Spain's

► PEACE OF WESTPHALIA AND RELIGIOUS TOLERANCE

The Thirty Years' War (1618–1648), which was the culmination of the religious wars that followed the Protestant Reformation in Europe, concluded in the Peace of Westphalia of 1648, which among its articles addressed the rights of subjects to practice a religion that may have differed from that of the “lord of the territory”:

“It has been decided that those adherents to the Confession of Augsburg who are subjects of Catholics, as also Catholics who are subjects of Estates of the Confession of Augsburg, who did not enjoy before 1624 at any time the public or private practice of their religion, or who after the publication of peace at any time in the future shall profess and embrace a different religion from the lord of their territory, shall be allowed patiently and with a free conscience to frequent privately their place of worship without being subjected to enquiry or disturbed; and they shall not be prevented from taking part in the public exercise of their religion in their neighborhood where and as many times as they wish, or to send their children for education in schools belonging to their religion or to private tutors at home.”

colonies indigenous populations were expected to adopt Christianity, but the Inquisition's jurisdiction over them ended early in the colonial period. Missionaries on the frontiers, however, frequently were partners with royal officials and their soldiers in the gathering of converts into mission compounds.

The French Crown, after the Wars of Religion had ended with the ascension of the House of Bourbon, faced the same issue of religious conformity. Henry IV granted toleration to the Huguenots in the Edict of Nantes (1589). Despite Cardinal Richelieu's efforts to limit Huguenot political autonomy, this toleration lasted until Louis XIV revoked the Edict of Nantes in 1685. A Huguenot exodus to the Netherlands, England, Germany, and the Americas followed. As in the case of Spain, imposition of religious conformity strengthened royal authority at a high cost in lost talent and labor. This move did not place the Sun

King (Louis XIV) firmly in the papacy's camp, as he continued to fight Rome over control of episcopal elections and other issues.

In England, the Tudors established royal supremacy through the declarations of a compliant Parliament. Religious policies varied according to the monarch. Henry VIII was quick to seize monastic lands but slow to impose clerical celibacy. Edward VI's advisers tried to impose Reformed Protestantism, while Mary, his half sister, attempted to restore Catholicism. Elizabeth I and her Parliaments arrived at a compromise called “latitudinarianism” that left Protestantism favored by the Crown without forcing religious unity. Under James I, the first Stuart monarch, an oath of allegiance to the Crown, including the royal supremacy, was imposed on all English subjects. This left Catholics unable to openly participate in government but did not unite Protestants. The internal stresses of the English church,

“Laudians,” supporters of Archbishop William Laud’s efforts to impose a decorous liturgy, versus Puritan partisans of plain services, helped bring about the English Civil War in 1642. The triumph of the Puritans in the Commonwealth was short-lived. An Anglican regime, established after the Restoration, was grudgingly tolerant of dissenters. The efforts of James II to favor Catholicism only ended in his flight to the continent, the so-called Glorious Revolution (1688–1689).

Germany became divided among Catholics, Lutherans, and Reformed. The Thirty Years’ War threatened to upset local arrangements. A Protestant revolt in Bohemia was followed by Catholic triumphs and a threat of extended Habsburg power. This threat to the status quo led to interventions by Denmark and Sweden funded by Catholic but anti-Habsburg France. Eventually division along confessional lines became the norm following the Peace of Westphalia (1648). (The Treaty did allow a certain degree of religious tolerance to Catholic or mainline Protestant minorities within the boundaries of individual states adhering to a different church.) Throughout western Europe, division by Christian affiliation became the norm. Even the papacy grudgingly dealt with the prospect of long-term division. Western Christendom would no longer be a unified entity. In curial circles, the Jesuit Robert Bellarmine adopted a theory of indirect papal power in temporal affairs. The pope could intervene “by reason of sin,” but he could not claim sovereign power outside the Papal States in central Italy. Ironically, one of the few principles on which all these powers agreed was the persecution of sectaries. All European powers suppressed the Anabaptists and others who refused to take oaths of allegiance to Christian

rulers. Some groups vanished, while others, like the Quakers, endured a long wait before toleration was extended to them.

The religious map of the seventeenth and eighteenth centuries saw little change. Catholicism was the predominant religion of the Iberian Peninsula, Italy, France, and the Habsburg lands in the Holy Roman Empire. Protestantism prevailed in much of the north, including England, Scotland, Scandinavia, and many of the German territories. Austria drove the Turks back from Hungary and parts of the Balkans, but the Habsburgs had given up efforts to redraw the religious map of the empire. Even the wars of Protestant Prussia and Catholic Austria in the eighteenth century did little to upset confessional balances. France, Spain, and Portugal would extend Catholicism into Asia and the Americas. Some of the Catholic clergy in the New World were critical of conquerors and of royal policies, but they rarely were seen as threatening the obedience of the American colonies to the authorities in Europe. English Protestant settlements in North America transplanted the religious divisions of Stuart England to a new continent. Even the Quakers would find a home in Pennsylvania, although they had faced persecution in Puritan New England.

■ Introduction: Politics and Gender

Women in patriarchal societies did not have an established or official role in politics. However, this did not preclude them from wielding power on many levels. Even though most of the experts in these societies deemed women unfit to rule or hold

political power in any capacity, there still remained avenues for women to influence both international and domestic politics.

The most common method by which women were able to establish an influence over state politics was as either queen consort

or queen regent. As a consort to the monarch, a woman was theoretically in a position to influence policy if her husband were inclined to seek her advice on matters. In the case where a monarch neglected his duties, his queen consort could be useful in governing. This was seen in the case of Nur Jahan, wife of the Mughal emperor Jahangir. Nur Jahan took control and governed to compensate for her husband's substance abuse issues. This was the one of the only avenues in which women in Asia could gain power, as women did not officially serve as regents. In Europe, the situation was different, as it was normal for a queen consort to officially be given control over the government during times where her husband was either physically absent from the court, or incapacitated. In addition, it was accepted that if a king died while the heir was still a minor, the dowager queen would serve as regent. This position was not only the most powerful one that a queen consort could obtain, but also the most precarious. A foreign queen was often suspect, and she often had to battle the nobles at court who looked to advance their own positions. Those who could not help the nobles achieve their ambitions often found themselves replaced by either a male relative of the king, or the young king himself if he were crowned before the appointed age of fourteen. Regents such as Catherine de Medici understood the limits placed upon their positions by their gender and circumstances, and worked within those restrictions in order to govern the realm and protect the throne for their son.

During the early modern period in Europe females ruled in their own right for the first time. Writers of the time questioned a woman's ability to rule, as it was a role that reached far beyond the established gender norms for elite females. Despite this, monarchs such as Elizabeth of England and Catherine of Russia were able to not only govern their realms effectively, but also to leave behind great legacies to commemorate their reigns. Marriage was probably one of the biggest issues a queen regnant would be forced to face: a queen would be expected to marry someone in her own social standing; however, the only men that would fit in this category would have to be another king. This posed a problem, as Mary I of England discovered when

she married her cousin Philip II of Spain. Even though strict rules had been set in place in order to prevent Philip from inheriting the English throne, Mary's subjects still felt uneasy about the Spanish king being her consort. Another choice for husband could be a noble of the realm, but this would then advance his family's fortunes well beyond those of the other nobles and cause unrest in that circle, as Mary Stuart, queen of Scotland discovered when she married James Hepburn, the fourth earl of Bothwell, a move that led to her abdication of the throne and exile to England. Maria I of Portugal avoided these issues by marrying her father's brother, Pedro, and Elizabeth I of England avoided the issue altogether by remaining unmarried. It was Elizabeth herself that stated that being queen meant that even though one's body might be weak, she needed the "heart and stomach of a king." Therefore, it was necessary to rule like a man, while portraying herself as behaving as a woman in all other matters. Gender did not expressly prohibit women from attaining power, but it created special circumstances that made it more difficult for them to maneuver through court.

African Matriarchy?

Scholars have long debated the legitimacy of claims that truly matriarchal societies have existed in Africa. Often matriarchy, or rule by women, has been confused with matriliney, or the tracing of one's familial heritage through maternal bloodlines. While a matrilineal system makes female kinship ties significant, it does not necessarily imply that women hold political power. Also, while many women across class lines have participated in politics throughout Africa, generally they have been less visible political actors, or their sphere of influence has been limited to issues that only concern women or the private domain. These facts, however, do not preclude the existence of legitimate and powerful female leaders. The question then becomes, were true female authority figures anomalous in Africa's history, occurring primarily in the absence of a suitable male figure, or were they merely less numerous, occurring regularly in certain societies

in which having a female leader is as acceptable as having a male or even preferable to it?

There are many examples of female leadership in Africa. Females assumed full monarchical power in ancient Egypt and Nubia and could be found in some empires in central Africa, such as Ndongo and Matamba. A far more common role for female leaders was the institution of the queen mother, which existed throughout West Africa. For instance, within the Asante empire (1701–1896), the queen mother was called the *obemmaa* (“female who rules”), and the office carried considerable political power. The *ohemmaa* had seniority in royal matrilineage and was chosen by her lineage mates. She headed the system of female chiefs that existed within Asante society and had the most influence over matters that pertained to the female population. Her opinion in selecting a new king carried the greatest weight of anyone in the empire.

In many societies, women were the ultimate authorities over female affairs. Within the Oyo empire (ca. 1400–1850) of the Yorùbá, for example, the Iyalode was a female chief with a council of subchiefs, was head of the market, and was administrator of all women’s affairs. She was an appointed figure, selected based on her leadership skills and her economic resources, and thus her position did not depend on her membership in any social class. She ascertained the women’s stance on societal matters and represented them at the council of kingmakers, although as the sole female representative she suffered from the disadvantage of being outnumbered by her male counterparts. In still other cases, women might hold offices with considerable symbolic power. Among the Pabir of Nigeria, the *maigira* (female monarch) was a princess chosen by the king and his counselors. Her primary function was as guardian of the sacred royal objects, which bestowed power to the king and his office. Because any man who used the sacred royal objects could assume the kingship, the *maigira* had to remain celibate to avoid coming under the influence of a man who might take advantage of her position.

As the above examples illustrate, powerful female leadership roles were a regular feature of the political structures of many African societies. Nonetheless, these societies do not constitute matriarchal ones. While women enjoyed

➤ WOMEN IN THE AFRICAN ORAL TRADITION

Positions of leadership for women still exist in many African societies although in an altered form, due largely to the changes brought by colonialism. Europeans brought their preconceived notions about women and their proper place in society with them and therefore overlooked women’s traditional roles when administering their African colonies. The place of women in African oral traditions, however, has in many cases remained unadulterated. In a number of African societies, women held a prominent historical place as the founders of cities, as leaders of migrations, and as conquerors. Hausa oral tradition enshrines Queen Amina of Katsina, who famously conquered a great deal of territory in the fifteenth century, going as far as Nupe and ultimately collecting tribute from many chiefs. She is even credited with introducing the kola nut to the region. In the myths about the establishment of So (ca. sixth–fifteenth centuries) in Cameroon, women are said to have chosen the sites for cities, carried royal insignia, and governed districts. The Lunda (ca. 1670s–1870s) in Kasai trace their heritage to the daughter of a chief named Lueji who married a hunter from the north named Ilunga Kibinda and promised him that he would rule the region. While colonialism often reduced the roles of women in many African societies, it has not reduced the important role of women in the memories transmitted in many oral traditions.

—Allison Sellers and Joel E. Tishken

significant participation in politics in most African societies, they were generally not seated in positions of absolute authority, nor did their communities inherently prefer female leadership. As elsewhere around the world, there were certainly exceptions: women who came to power and ruled states independently of men, such as in Nubia. They remain, however, exceptions to the norm. Most African societies could be more accurately categorized as dual-sex political systems in which positions of authority had male and female counterparts who operated on nearly equal footing with one another. In this fashion, African political structures mirrored African notions of gender whereby male and female were seen as a complementary pairing.

While generally unequal in their authority and domains, most African societies possessed political structures for both males and females.

Queen Regents in Early Modern India

The terms "women" and "power" were rarely linked before modern times, especially in Asia, but this separation was sometimes more apparent than real. The "harem influence" could be most persuasive when skillfully applied, and there are instances in which women took control, either in name or in fact, and provided expert leadership.

India in early modern times was mostly under Muslim control, and Muslim societies tried to shape their lives according to the Quran and other Islamic authorities. These borrowed heavily from the social and cultural patterns of pre-Islamic Arabia, a land rife with warring and feuding tribes. The women were needed to bear sturdy sons who could defend the tribe and its holdings. Their marriages were usually arranged, and their purity had to be ensured. In Islamic societies, as in many others, the boys might have their little amours, but respectable girls did not.

In India, Muslim rule was established by Turkish and Afghan warriors with proud tribal lineages, abetted by Persian and occasionally

Arab nobles. They formed an elite, called ashrafis, with a status higher than that of Indian converts to Islam. Their women were treasures whom they safeguarded, never letting them show their faces or forms outside the harems (or women's quarters) of their houses. Those who aspired to this aloof respectability, Hindus as well as Muslims, followed this practice of *pardah*. No doubt many girls wished for a fuller, less confined life; the tales of the *Thousand and One Nights* are essentially such fancies.

Aspiring to political power and influence was rare in early modern India, obtaining it rarer still, but several such extraordinary women are known to history. Most conspicuous was Nur Jahan, wife of the Mughal emperor Jahangir and virtual ruler of the empire for most of his reign. Jahangir, born Prince Salim, succeeded his father, the great Akbar, on the Mughal throne in 1605. By 1611 he had been captivated by the beauty, grace, and sense of a court lady, a 30-year-old Persian widow named Mehrunissa (or Mihr-un-Nisa).

Mehrunissa was the daughter of an expatriate Persian noble, Itimad-ud-daulah. She was married to a provincial official who was killed in a political dispute. She then joined the court as a lady in waiting, where she captivated the emperor. He dubbed her Nur Jahan ("Light of the World"). As Jahangir sank more deeply into the frequent use of alcohol and other drugs, Nur Jahan took more control of the court and, by extension, the empire. Her father became the imperial revenue minister, and her brother, Asaf Khan, became a high court minister. Together they have been called "the Nur Jahan junta."

Nur Jahan's power peaked in 1620. She had had an uneasy alliance with the strong-willed heir-apparent, Prince Khurram; she had even arranged Khurram's marriage to her niece, Arjuman Begum, called "Mumtaz Mahal," the lady later entombed in the Taj Mahal. But in 1620 she married her own daughter to Prince Shahriyar, youngest son of Shah Jahan, intending to continue her power through his succession. The wary Khurram gathered his forces and allies. When Jahangir died in 1627, Asaf Khan unexpectedly intruded and blocked his sister's plans, opening the way for Khurram to mount the throne as Shah Jahan. This of course meant the end of Nur Jahan's career. Losers in Mughal

politics rarely survived, but she was allowed a dignified retirement.

In traditional Hindu society, as in Muslim society, there were no career openings for women in politics. Those few who achieved power succeeded fathers or husbands, and their talents glittered. Such a one was Tarabai, Maratha queen during a critical decade (1701–1708), whose leadership and shrewdness probably rescued the Maratha nation. J. N. Chaudhuri, an expert in the field, has described her as possessing organizational power and astounding bravery, poise, and administrative capacity, all characteristics that helped to save Maratha from a turbulent period.

That turbulent period was the determined drive of Aurangzeb, the Mughal emperor, to conquer and rule the Marathas after the death of their founder-hero, Shivaji, in 1680. The powerful Mughal armies overran the Maratha strongholds, smashed their state, and chased the fleeing warriors through the hills and valleys of western and central India and into southern India. In 1688 Mughal forces captured and killed Shambuji, son and successor of Shivaji, and took his young son Shahu to the imperial court as a “guest.”

The Maratha leadership was then taken by Rajaram, younger son of Shivaji, and upon his death in 1700 by his senior widow, Tarabai, 25 years old, in the name of their 4-year-old son Shivaji III. Tarabai, a child bride, had been the daughter of Shivaji’s army commander, Hambir Rao Mohite. In the emergency she surmounted factional politics and personal jealousies to command. With her officials she fled from one hilltop fortress to another, always eluding the ponderous, slow-moving Mughal forces. By 1702 the Marathas’ harassing guerrilla tactics had turned the tide, and their counterattacks swept through central India against the exhausted and bloodied Mughals. Finally, the frustrated Aurangzeb withdrew his forces and then died in 1707.

The new emperor, Bahadur Shah I, had a better plan than invasion: he freed Shahu, now mature, and sent him back to Maharashtra to undercut support for Tarabai and bring Maharashtra into the empire. The latter part never worked, but the former did, brilliantly. The Marathas were absorbed in a spasmodic civil war for the next decade. Most of Tarabai’s

chieftains and army commanders promised support, but popular backing grew for Shahu as the legitimate heir. In 1713 Shahu appointed as his peshwa (prime minister) an astute and skillful Brahman, Balaji Vishvanath Bhat. The peshwa steadily reconciled Maratha stalwarts to Shahu until Tarabai and her loyalists were reduced to the mountainous state of Kolhapur.

Then, in the dizzying kaleidoscope of Maratha politics, Tarabai was overthrown and imprisoned in Kolhapur; in 1730 after the death of her son, she rejoined Shahu at his capital of Satara and persuaded him to name her grandson Ram Rajya as his heir. After Ram Rajya succeeded Shahu in 1748, she denounced the relationship, claiming that he was not really her grandson, and had him imprisoned, becoming queen. She died in 1761, her ambition not totally eclipsing her heroic history.

Another widow who stepped into a breach was Chand Sultan, also known as Chand Bibi. The daughter of a sultan of Ahmadnagar, in the western Deccan, she married the neighboring sultan of Bijapur. After his death she returned to Ahmadnagar in 1595, where she protected the infant heir to the throne against would-be usurpers. Then the Mughals, invited by a frustrated contender for the throne, invaded and besieged Ahmadnagar. Chand Sultan took control, borrowed troops from Bijapur and Golconda, and organized such an effective defense that the Mughals withdrew. However, in 1600 the Mughals invaded again, and when Chand Sultan tried to negotiate with them, she was accused of treachery and was attacked and killed by a local mob.

Female Rulers of Early Modern Europe

In early modern Europe (1500–1789) there was a dramatic increase in the phenomenon of female rule in comparison to the medieval period. Female rule appeared in two major forms: queens regnant, women who inherited the office of king due to a temporary lack of legitimate male heirs, and dowager queens, who ruled as regents on behalf of their underage sons or daughters.

At the beginning of this period, the first and perhaps the most remarkable of regnant queens was Isabel of Castile (r. 1474–1504). Before her accession Isabel married Fernando of Aragon, which ultimately facilitated the political unification of

Spain. While royal heiresses in medieval Europe often found their political prerogatives usurped by their husbands, Isabel and Fernando ruled their respective kingdoms as equal political partners, a unique arrangement in early modern Europe. This was not the case with Isabel's heir, Juana "the Mad" (r. 1504–1509), whose rights to the Castilian throne were appropriated first by her husband, Philip of Burgundy, and later by her eldest son, Holy Roman Emperor Charles V.

In England, the first regnant queens, Mary I (r. 1553–1558) and Elizabeth I (r. 1558–1603), came to their thrones unmarried. Both were daughters of Henry VIII (r. 1509–1547), whose rights to the throne were enshrined in parliamentary statutes. During her short reign Mary attempted to reverse the course of the Protestant Reformation by reimposing Catholicism in England (earning her the enduring epithet "Bloody Mary"). Her marriage to her Catholic cousin, Philip of Spain, was highly unpopular throughout England and sparked a serious revolt against the queen in early 1554. In contrast, Elizabeth I defied conventional expectations by not marrying, which allowed her to avoid the problems that had plagued her sister and rule unaided as an autonomous female ruler. Often considered the greatest ruling queen in European history, Elizabeth presided over the final phase of the English Reformation, facilitating the development of the Anglican Church and England's emergence as a major European power. Her naval forces defeated the Spanish Armada of 1588. In the final years of her reign, the arts, literature, and theater flourished in England, which is justly called the Elizabethan Age.

In the late seventeenth century, the English experienced two more female rulers. Mary II (r. 1689–1694) reigned jointly with her husband, William III, following the Glorious Revolution of 1688–1689, a watershed event in English constitutional development. Lacking direct heirs of their own, William and Mary were succeeded by Queen Anne (r. 1702–1714). Anne's reign is often referred to as the Augustan Age, an outpouring of literature, science, and philosophy that formed a major component of the European Enlightenment. England emerged as a global imperial power during Anne's reign as England emerged victorious from the War of the Spanish

Mary I was queen of England from 1553 to 1558. She restored Catholicism to England, and after the subsequent burning of hundreds of heretics, she became known as "Bloody Mary." (Library of Congress)

Succession (1702–1713). Elsewhere in Europe, Christina of Sweden (r. 1632–1654) shocked convention by converting to Roman Catholicism and abdicating her throne, and Maria I (r. 1777–1816) became Portugal's first regnant queen. A procession of female tsars ruled Russia over the course of the eighteenth century, including Anne (r. 1730–1740), Elizabeth (r. 1741–1762), and, most famous at all, Catherine the Great (r. 1762–1796), a ruthless ruler who introduced the western European Enlightenment to Russia.

Dowager queens who ruled as regents were another form of female rule. Mary of Guise ruled as regent in Scotland on behalf of her daughter, Mary, Queen of Scots, during 1554–1560. In France, a procession of dowager queens wielded significant power over the course of the sixteenth and seventeenth centuries. Catherine de Medici, the widow of Henry II (r. 1547–1559), served briefly as regent for her husband in 1552 while he was away in Italy as well as for her son Charles X during 1560–1563 after the death of Henry. However, until her death in 1589, Catherine informally wielded great power as France experienced successive and bloody wars of religion between Protestants and Catholics. In the seventeenth century, both Marie de Medici, the widow of Henry IV, and Anne of Austria, the widow of Louis XIII, served formally as regents and informally as *de facto* rulers on behalf of their underage sons, Louis XIII and Louis XIV, respectively. The status of dowager queen was the main outlet of political power for women in France because the Salic Law expressly decreed that women could not officially inherit the throne.

While female rulers were often successful in gaining access to political power due to their kinship relations to male politicians, they nevertheless suffered difficulties imposing their authority over male-dominant political structures. In early modern European societies, women of all social classes were commonly held to be inferior to men physically, intellectually, and emotionally. As such, female rulers often faced formidable challenges to their rights to rule. Mary, Queen of Scots, regnant queen of Scotland from 1561 to 1568, endured a series of aristocratic attempts to control her authority until she was deposed in 1568. Writers such as John Knox, the author of *The First Blast of the Trumpet against the*

Monstrous Regiment of Women (1558), cited both Scripture and Roman law as a justification for their opposition to female rule. Female rulers were also hampered by either the difficulty of or inability to perform such kingly roles as leading armies and exercising control over national churches, which were among the fundamental powers exercised by male kings. The major part of this difficulty was that female rulers were expected to conform to conventional female roles, although they held the reins of political power. Historians of the early modern period generally view Isabel of Castile, Elizabeth I of England, and Catherine the Great of Russia as the only sovereigns to successfully overcome the formidable gendered challenges to successful female rule.

Queen Regents in Early Modern Europe

When a king became incapacitated or died while his son was still a minor, it was necessary to institute a regency in order to rule the country. Most of the time the dowager queen was appointed as the regent and usually had a council of nobles to assist her. This office was one of the ways that women could take direct control of the kingdom during a time when female monarchs were few and far between, especially in countries where female monarchs were expressly forbidden by law.

Early modern Europe experienced a succession of crowned princes either incapable of ruling or unwilling to rule after the age of majority, which was fourteen in most countries. One of the most famous cases of this was Charles IX of

► QUEEN LOUISE OF SAVOY

Louise of Savoy, mother of François I of France, is probably most well known for the international diplomacy she enacted as regent for her son. The first time she acted as regent was in 1515 while François was fighting war in the Italian Wars. She served a second time in 1525 when François left again for Italy, but her regency lasted longer than anticipated after the king was captured and made a prisoner of Holy Roman Emperor Charles V. Even though the Salic law forbade women from ruling France, this was indeed what Louise was forced to do. Determined to free her son from captivity, she sent an envoy to the Ottoman sultan Suleiman I. In an agreement that served to be the first of its kind, Louise was able to begin the first steps toward a Franco-Ottoman alliance what would later become known as the “sacriligious union of the Lily and the Crescent.” Louise’s attempts at peace with the

Ottomans gave Suleiman the excuse he needed to attack Hungary in 1526 and began a period of Ottoman interference in European affairs.

Louise’s services were required by the king again in 1528. François was anxious to make peace with the emperor once more; therefore, he sent his mother to negotiate the treaty with another regent, the emperor’s Aunt Margaret, duchess of Mantua, and the regent of the Netherlands. While hesitant at first, Margaret agreed to meet Louise in Cambrai to begin peace negotiations while the French king spent his time hunting. Finally, the terms of the peace were settled between the two women on August 3, 1529, and the Peace of Cambrai became known as “The Ladies’ Peace,” as it was conducted between two women. This peace is symbolic of the potential political power held by queen regents.

—*Monique Vallance*

France. His brother, Francis II, died in 1560, leaving a nine-year-old Charles on the throne. Unfortunately, this was one of the most desperate eras in French history, as Catholics and Protestants fought over doctrinal differences. His mother, Catherine de Medici, served as regent until 1563 when he reached his age of majority. However, until his death in 1574, he showed no interest in ruling and depended completely on his mother. Although she desperately attempted to make peace between the warring parties, she only made things worse as she attempted to assert her control over her son, keeping him from being too influenced by either of the parties. In fact, it was the Protestant admiral Coligny’s influence over the young king that prompted Catherine to order his assassination, the bungling of which sparked the St. Bartholomew’s Massacre in 1572. Portugal experienced a similar situation in 1656 when the 13-year-old Afonso VI ascended to the throne. Even though he achieved his majority ten months later, he also showed no interest in ruling. He had suffered an illness at the age of three that paralyzed the left side of his body. Contemporaries refer to him as mentally deficient, and his favorite pastime was riding around Lisbon in search of citizens to assault. His mother, Dona Luisa de Gusmão, extended her regency until

1662. She also handled a very important situation in Portuguese history; it was her alliance with England that guaranteed a peace settlement between Portugal and Spain in 1668.

Other queen regents ruled in the place of more capable children but still handled very challenging civil wars in their countries. For instance, Louis XIV’s mother, Anne of Austria, had to deal with the Fronde, a rebellion of the nobles against the centralization of royal power during 1648–1653. Mary of Guise, a French woman who was queen of Scotland, served as regent for her daughter Mary I, or as she is more famously known, Mary Queen of Scots, during 1542–1560. Mary was only six days old when James V died, and then she left for France in 1548 after the marriage arrangement between herself and the future Francis II was complete. She stayed in France for the next thirteen years while Mary of Guise ruled as her regent. During her years as regent, Mary of Guise had to contend with the growing Protestant faction in the country, who mistrusted her because of her religion and her French heritage, especially after she called on her family to help her quell their activity. Mary of Guise died in July 1560, and Francis II died the following December. After this double loss, Mary Stuart returned to Scotland to find the

country on the brink of civil war, and her own reign ended tragically as a result.

Even though the position of regent could be a powerful one, it was nevertheless an acceptable one for women in early modern Europe. This is because a woman who acted as regent for her son or daughter was fulfilling the most acceptable role designated for women: that of a mother. As long as the queen portrayed herself as someone who was acting in the best interests of her son and the country, her position could remain stable. Also, as a member of the royal family, she was outside the political warring that often happened at court among members of the other noble families. A king, even a child, who sided with one faction or the other could be putting himself in danger of being overthrown. The queen regent had the job of protecting the throne for her child from both domestic and foreign threats. Often seen as times of weakness in royal power, regencies were times in which either nobles or foreign powers took the opportunity to attack the king. Those queens who had some government experience during their husband's life usually fared better than those who had none. More often than not, success entailed an understanding of the dynamics of the delicate political situations at court, and those who ignored these things saw failure in one form or another.

Female Rulers in Early Modern Eastern Europe

Three main patterns characterize the political roles that East European female rulers played during the Early Modern period. Female rulers

in Poland boasted a prominent position in their kingdom's political life and thus were comparable to their royal counterparts in western Europe. In contrast to Poland, other contemporary East European nation-states were ruled by either the Habsburg empire or the Ottoman empire from approximately the fifteenth century to the nineteenth century. Non-Germanic female noblewomen who found themselves under Habsburg control could not rule their dominions directly but did affect the politics of the empire nonetheless by playing active roles in resistance struggles alongside their husbands. The areas occupied by the Ottoman empire witnessed few examples of indigenous female rule but were exceptional in that the sultan's wives and Ottoman princesses shaped the region's fate for approximately two centuries.

Among all the East European realms, Poland's female rulers participated most actively not only in the politics of their dominions but also in western European affairs. Although traditional Polish custom opposed female involvement in politics, these attitudes changed by the second half of the seventeenth century when Polish queens took an increasing interest in the activities of the parliament. By the eighteenth century women in power became increasingly visible in the public realm; they affected both domestic and foreign affairs as instigators or advocates of particular political ventures. Seventeenth-century queen consort Ludwika Maria Gonzaga aptly illustrates the growing influence of women in Polish royal politics. She founded Poland's first newspaper, *Merkuriusz Polski*, in which she promoted strengthening the position of the monarch and weakening the nobility. Even when Polish female rulers could not exercise their power as proactively as Ludwika Maria Gonzaga, they could shrewdly use dynastic politics and their family linkages to advance themselves in the hierarchy of European powers. Once in a position of influence, Polish monarchs created networks with other European female rulers, thus advancing their informal powers and their ability to affect the political, cultural, and religious life of their realms.

There is little research indicating that countries under the rule of the Ottoman empire, including present-day Bosnia, Serbia, Bulgaria,

► MARIA THERESA

Maria Theresa, the queen of Hungary and Bohemia and the archduchess of Austria, was the first and only female ruler of the six-century-old Habsburg dynasty. She did not merely inherit the Habsburg lands from her father Charles VI in 1740; she saved them from disintegration by remedying the empire's domestic and international standing. Maria Theresa began her reign in an unenviable position. A number of European powers aimed to divide the Habsburg lands among themselves, not recognizing Maria Theresa's claim to the throne. The new dynast, determined to preserve the unity of her lands, fought the War of Austrian Succession (1740–1748) and emerged victorious. After the victory, Maria Theresa instituted tax reforms that at once improved the empire's economy and allowed her to fund an impressive army capable of defending Habsburg interests in the future. She also instituted a whole range of well-coordinated internal policies. In 1774 Maria Theresa's general school ordinance made elementary education compulsory for all children between the ages of 6 and 13. Austria thereby became one of the first states in Europe to establish a system of public elementary education. Legally, the queen centralized the empire's bureaucracy, making administrative affairs of an overextended realm more efficient. She also created a Supreme Court, securing and affirming the rule of law in her territories. However, this female monarch, who reigned for 40 years, had not devised a long-term solution to increasingly complex religious and ethnic predicaments that were progressively weakening the empire.

—Marko Dumancic

Maria Theresa, Holy Roman Empress, presents the crowns of Bohemia, Hungary, and the Imperial crown in this painting by Anton von Maron, about 1772. (Réunion des Musées Nationaux/Art Resource, NY)

Albania, Romania, and Greece, possessed female rulers who fought back against the dominance of the Turks. However, this part of eastern Europe was in large part affected by female rule in Istanbul. Between the sixteenth and seventeenth centuries the dominance of women in both internal and external affairs of the empire was so marked that it is often termed “the sultanate of women.” The rise of female power during this period was linked to the gradual transformation of the Ottoman empire from a military expansionary state to one dedicated to diplomacy. Consequently, the sixteenth-century

focus on political stability outlawed the custom in which brothers competed to death for the sultan's title. Instead, the eldest brother succeeded to the throne. In the new system, harem marriages affected the policies of the government; consequently, the sultan's mother had influence, and sometimes a decisive voice, on matters of succession. In addition to domestic affairs, the royal mother also played a diplomatic function as the Ottoman empire sought a *modus vivendi* with Christian kingdoms in Europe. Not to be overlooked are these rulers' charitable works: the construction of various public institutions

such as mosques, saunas, and public wells and fountains. Women of the Ottoman royal harem, such as Hurrem and Nurbanu, were equal in power and status to other formidable female European monarchs of the period, including Mary, Queen of Scots, or Catherine de Medicis as well as female sovereigns in both Persia and India.

East European female nobles who were under the rule of the Habsburg Dynasty could not exert the kind of political influence available to Polish queens and sultans' mothers. There are examples, however, of female rulers who valiantly fought to liberate themselves from foreign domination and establish themselves as independent sovereigns. Hungarian duchess Ilona Zrinyi, for example, was an active participant in the late seventeenth-century kuruc uprising. Together with her husband, Imre Thokoly, and supported by Sultan Mehmed IV, Ilona Zrinyi fought against Holy Roman Emperor Leopold I. The

goal of her struggle was to not only wrest away Hungarian lands from Habsburg dominance but also to provide religious freedom to Protestants occupying Habsburg dominions. Although defeated by Austrian forces and largely unsuccessful in achieving her goals, Ilona Zrinyi's son, Francis II Rakoczi, continued her struggle, and she became a Hungarian national hero in subsequent centuries.

■ Introduction: Patterns of Conquest and Rebellion

The period between the fifteenth and eighteenth centuries involved remarkable political and military transformations around the world. The centuries-old Byzantine empire collapsed under the onslaught of the dynamic Ottoman state. The Mongol khanates declined and a powerful Safavid state emerged amidst the ruins of the Iranian polities while the Ming dynasty, followed by the Manchu dynasty, restored China's prominence in the Far East. In India, the campaigns of Babur and his successors laid the foundation for the glorious Mughal empire as the European conquistadors embarked on their remarkable conquests in the western hemisphere. At the same time, domestic rebellions—the Peasants' War in Germany, the Celali Revolts in the Ottoman empire, and the Pugachev Uprising in Russia to name just a few—threatened to overthrow the existing political and social hierarchy. Rural and urban riots triggered by rises in food prices were frequent and commonplace. The urban lower classes lived from hand to mouth and the scarcity of supplies, caused by poor weather or lack of foresight by

local magistrates, could provoke violent expressions of their discontent. But such rebellions could be also prompted by religious, social, or political factors or a combination of these. Thus, in the Netherlands, the Spanish efforts to contain the spread of Protestantism encountered increasing Dutch resistance, which finally erupted in the Iconoclasm of 1566 when Protestants sacked Catholic churches. Yet, fearing social rebellion, some leading Protestant Dutch noblemen chose to side with the Spaniards in suppressing the riots. Ultimately, it was the ruthless policies of the Spanish commander the Duke of Alba that drove Protestants into open rebellion against Spain. Similarly, in 1709, the brutality of the Safavid forces in Afghanistan sparked a rebellion among local tribesmen, who then went on to overthrow the Safavid dynasty in 1722. In the Ottoman empire, severe economic and social pressures in rural Anatolia caused the prolonged Celali Revolts that shook the Ottoman state in the late sixteenth and early seventeenth centuries. In England and France, the monarchs' attempts to strengthen their authority produced

contrasting results: while the French king triumphed over the nobles during the Fronde, his counterpart in England succumbed to Parliament in the Glorious Revolution. From the sixteenth century to the eighteenth century there was a series of peasant wars throughout the world. These rebellions were prompted by economic hardship (e.g., massive peasant uprisings led by Li Zicheng and Zhang Xianzhong in mid-seventeenth century China), resistance to intensified serfdom (e.g., the German Peasants' War, the Hungarian Crusade, the Cossack revolts in Russia), as well as revolts against state centralization (e.g., the Croquant uprising, the Swiss peasants' war, the revolt in Naples).

Globally, one of the most important patterns that scholars highlight in the early modern era is the gradual unfolding of the "Military Revolution" in Europe—a profound military, political and socioeconomic transformation between the sixteenth and eighteenth centuries. Such an approach usually focuses on the European expansion around the world, in particular the Spanish conquests of the Aztec and Inca states and the arrival and establishment of European navies in the Indian Ocean, where local Islamic and Indian states proved to be unable to retain supremacy of the seas. Equally interesting, however, is the increasing ability of Europe to fight off the Ottoman attacks, clearly revealed when comparing the Christian failures of the early sixteenth century with successes of the seventeenth century.

But we must not consider the eventual European dominance as inevitable since alongside successes, there were also plenty of failures. Non-European traditions greatly varied—from the sophisticated Ottoman and Chinese armies to primitive (militarily) forces in Siberia or North America—and Europe fared differently in its encounters with them. Closer inspection of events reveals that after the initial period of European conquests (roughly 1492 to 1560s), there was a long period during which this expansion slowed, halted, or was even reversed. Indeed, until the late eighteenth century much of Asia successfully resisted European inroads while adopting some European military techniques and weapons. China remained the most expansive and strongest state in East Asia, successfully containing the Portuguese to its coastline in the

sixteenth century, and the Dutch in Formosa (Taiwan) in the 1660s, and preventing Russian advances in the Amur valley in the 1680s. The Omani Arabs expelled the Portuguese from East Africa in the 1690s, and the Ottomans continued to display remarkable resilience and success against European attacks in the early eighteenth century. In the seventeenth and eighteenth centuries coastal West African states proved to be perfectly capable of resisting Europeans, who were successful only when supported by local troops. These setbacks were facilitated by intra-European rivalry which caused a concentration of resources upon warfare within Europe as well as continued overseas expansion at the expense of other European powers. Yet, one must also remember that Europe was a much more volatile region than, for example, central Asia, West Africa, or China, and this continued warfare allowed some European states to acquire an edge in military tactics, weapons, and administrative and political capability that eventually contributed to Europe's emergence as the dominant global power in the nineteenth century.

The European conquest of the vast American continent also offers some interesting patterns. When Europeans arrived in the Americas, they found a multitude of cultures and states interconnected through a complex web of relations, one of them being trade and commerce. The European conquests—of Cortes and Nuno de Guzmán, in central Mexico, Pizzaro in Peru, Francisco and Pedro de Alvarado Orozco in Guatemala, or Francisco de Montejo in the Yucatan Peninsula to name just a few—consequently followed the pre-Columbian trade routes which greatly contributed to their success. From the earliest years of Spanish colonization of the western hemisphere, the Spaniards became aware of how quickly they could seize control over local population by capturing local leaders. This tactic may have had precedents in Spanish experiences with the Moors or in North Africa, but the surprise capture of the local ruler during a seemingly friendly negotiation became a standard. Thus, in 1519, Cortés, invited to an audience with the Aztec emperor Moctezuma II, captured the emperor in an attempt to seize control of the empire. His success inspired Francisco Pizzaro to capture the Inca leader Atahualpa in 1531.

Diseases, and the Native Americans' lack of immunity to them, played an important role in the success of the European conquest in the western hemisphere, but the roles were reversed in Africa and parts of Asia where Europeans' exposure to deadly diseases (e.g., yellow fever) halted their expansion. In the Americas, despite the impact of diseases, Europeans often had to overcome local resistance and their military superiority usually played a major role in determining the outcome. Yet, European colonial coercion also invariably depended upon the collaboration of local elites. Despite the popular perception of the Spanish conquistadors as invincible and gallant warriors, the real story of success lies in local elites' early support for foreign invasions. Their motivation included both the desire to free themselves from existing military and tributary controls as well as the opportunity to aggrandize themselves with land and riches. Indeed, alliance-building was a fundamental practice in Mesoamerica, successfully used by the Aztecs in the form of the Triple Alliance (confederation of city-states of Tenochtitlan, Texcoco, and Tlacopan) to incorporate much of the region into their empire prior to Europeans' arrival. When Cortés arrived in Mesoamerica in 1519, the Fat Cacique of Cempoala followed a long-standing alliance-building tradition in offering the Spaniard an alliance with Tlaxcala, Huexotzingo, and other city-states against the powerful Aztecs; the presence of tens of thousands of native soldiers allowed the Spaniards to bring down the Aztec empire.

Finally, an important, and often overlooked, aspect to the conquest was the nonmilitary participation by natives who, by serving as spies, interpreters, porters, cooks, and so on rendered invaluable services to the conquerors. Such practices were not limited to Central or South America alone. During the seventeenth and eighteenth centuries, European states sought alliances with North American tribes and often used them to conduct proxy wars against each other; Britain and France became particularly adept in using their Native American allies to further their geopolitical interests during King George's War (1744–1748) and the French and Indian War (1756–1763). In India, the continued disunity, factionalism, and treachery among local

polities greatly facilitated European penetration, conquest, and dominance. At the same time, the conquest was less difficult where there were existing political institutions that the conquerors could take over or reach an accommodation with. For example, less urbanized or nomadic peoples, practicing asymmetrical warfare in difficult terrain, could successfully frustrate efforts of a more sophisticated and powerful enemy as the Russians discovered in the wilderness of Siberia and the Spaniards in Amazonia and the Andes. Europe's limited material and human resources meant that European overseas expeditions were, as a rule, small in size and relied on technological advantages. They usually sought a limited presence and not a complete dominance of a region. In fact, the European conquest of the Americas is more an exception than a rule. In Asia, the first decades of the European presence were limited to controlling key locations (islands, cities, straits) and building fortresses that were defended by navies. Such colonies were rarely built in territories controlled by major Asian states that could successfully repel Europeans as revealed by events in India, where the Mughals forced the East India Company to evacuate their Bengal base and surrender Bombay in 1686.

Aside from European expansion, one of the more important events in the early modern period was a rapid expansion of the Ottoman state into the Balkans, North Africa, Caucasus, and Mesopotamia. Historians distinguish several interesting patterns in these conquests. The early Ottoman sultans expanded their principality by *ghaza*, a religiously inspired holy war against their non-Muslim neighbors, which, however, was often conducted for predatory reasons, without any religious motives but rather in search of plunder and bounty. The Ottoman rulers also proved adept in arranging dynastic marriages by which they acquired new lands and military assistance. Local conditions and international geopolitics played an important role in determining the status of the newly occupied territory. Syria, conquered in 1516, was turned into an ordinary province while the Kurdish princes of eastern Anatolia (facing Iran) and the khans of Crimea (facing Russia) were given greater latitude of action. The Ottoman rulers also promoted

migration and resettlements of Turkoman nomads to the newly conquered areas. In the Balkans and the Caucasus, such policies sought to establish strongholds of Turkic-speaking loyal Muslim subjects and weaken the resistance of the local Christian population. The Ottoman sultans also sought to gain supporters among local non-Muslim nobility by granting them military fiefs (*timars*) in return for their acceptance of and loyalty to Ottoman suzerainty. Finally, the often-forgotten Ottoman passivity in Europe in the eighteenth century had a major impact on European political affairs as it allowed some European states (e.g., Austria, Russia) to pursue more aggressive foreign policy vis-à-vis their neighbors in 1733–1735, 1740–1748, 1756–1763, and 1792–1815.

Akbar's Subjugation of Rajasthan

The reign of Akbar (Jalal-ud-din Muhhammad Akbar), who ruled from 1556 to 1605, transformed the history of the Mughal empire. Surpassing his predecessors, Babur (r. 1526–1530) and Humayun (r. 1530–1556), Akbar established unrivaled dominance over the Indo-Gangetic plains, the densely populated region between the Indus and Ganges rivers and a historical stronghold of Indo-Muslim power. He also embarked on a series of conquests that would unite the northern half of the Indian subcontinent under Mughal sovereignty. In addition to expansion, Akbar consolidated his power by creating a centralized state structure that brought the governments of the *parganas* (subdistricts), *sarkars* (districts), and *subahs* (provinces) as well as the military and nobility under direct control of the emperor. Akbar's reforms to the existing system of land assessment and revenue collection further centralized the Mughal state and persisted throughout the Mughal period and even into the British colonial period. The subjugation and incorporation of Rajasthan, a region south of Delhi composed of smaller kingdoms ruled by Rajputs, remains one of Akbar's earliest and most significant accomplishments in the continued expansion and consolidation of the Mughal state.

Situated on the southern frontier of the Mughal empire, Rajasthan became a coveted prize

for Akbar. Composed of fierce leaders and clans of the Kshatriya caste, Rajput kingdoms had posed a formidable challenge to Indo-Muslim power and expansion in the centuries before Mughal rule. Akbar's first foray into Rajasthan began with the conquest of Ajmer (1558) led by his first regent and military general, Bairam Khan (1556–1560). Later in 1568, a more mature Akbar launched his own military campaign against one of the most powerful Rajput rajas, Udai Singh (1540–1572), the Rana of Mewar. Mughal use of gunpowder—both guns and cannons—proved decisive for Akbar as he laid siege to Chitor, the fortified capital city of Mewar. Udai Singh fled Chitor, never to regain his kingdom, and Akbar commanded the destruction of the city fortress. During the following year, Akbar conquered another Rajput stronghold, Ranthambor, in a similar display of military superiority and power. Akbar's military prowess and achievements in Rajasthan strengthened Mughal prestige throughout the region and the entire empire.

The expansion of the empire was more intricate than the use of military force. While many Rajputs resisted the encroachments of the Mughal empire, other Rajput chiefs negotiated with Akbar, pledging their allegiance and service to the emperor in exchange for imperial privileges and continued rights to their lands. To crystallize the relationship, Rajput leaders offered their daughters in marriage to Akbar. A long-standing tradition within Rajput customs, matrimonial alliance (*saga*) was one of two ways that Rajputs forged ties with each other, and the practice between Rajputs and Mughals began in 1562 when Akbar himself married the daughter of Bharamall, a minor Rajput head of the Kachhwaha clan of Amber. For Rajput leaders like Bharamall and his male kin, the matrimonial alliance with Akbar ensured that their leadership and land at the local level remained intact and that Rajput culture and customs were protected. Additionally, Rajputs became the most heavily recruited population of non-Muslims for the highest-ranking posts in Akbar's military and administration. In exchange, Rajput leaders acknowledged the sovereignty of Akbar over Rajasthan and served the emperor in military and administrative capacities.

AKBAR-NAMA

How do historians know about the statecraft and politics of Akbar? One of the most elaborate sources of Akbar's reign is the *Akbar-Nama*, a multivolume work authored by the emperor's close adviser, Abul Fazl. The first two volumes of the *Akbar-Nama* offer a detailed history of Mughal rule, complete with impressive Mughal miniature paintings. The three-volume appendix, *Ain-i Akbari*, is an imperial manual for the administration of the Mughal state. Several chapters in the second volume depict Akbar's encounters with Rajputs, including the capture of Chitor, the conquest of Ranthambor, and the marriage between Akbar and his Rajput wife from Amber. The stories of Akbar's subjugation of Chitor and Ranthambor, both results of battle, emphasize the emperor's superior military skills and divine inspiration. In chapters on intermarriage and negotiated alliances with Rajputs, Abul Fazl makes Akbar's generosity and accommodation central to the narrative. Collectively, the volumes provide historians with an invaluable source for understanding Mughal perceptions of themselves and Indian society as well as the procedures and means undertaken by the emperor to more efficiently manage the military, revenue collection, and administration of the empire.

The following excerpt from the *Akbar-Nama* chapter titled "Expedition of the World-Conquering Army of the Shahinshah for the Conquest of the Country of Gujrat" describes how Akbar believed that the expansion of his empire would benefit the

populations of the newly acquired territories, including the "oppressed":

"The pious lord of the world always regards external administration as the decoration of the world of reality, and without any contamination of human desires recognises that his own satisfaction lies in the soothment of mankind. He always perceives what things are most important, and applies himself to the gathering together of the distressed and dispersed ones of the age. In conquering countries and cities his first thought is to inquire into and sympathise with the condition of the oppressed. Hence wherever the rulers act wisely and exert themselves to protect their subjects, he does not set himself to conquer that country though the means for doing so be at hand. And although it is clear to the front of his holy mind—which is truth's arena—that every extension of territory brings the plurality of the world into the majestic uniqueness of one of the sublime administrators of justice, and thus brings the highest form of worship to the bridal-chamber of manifestation, yet as the motive of his genius is the preservation of the general public—who are a wondrous trust from God—he does not address himself to such worship."

Source

H. Beveridge, trans., *The Akbarnama of Abu-L-Fazl*, Vol. 2 (Calcutta: Asiatic Society of Bengal, 1897–1939), 536.

Keenly aware of his limitations as a Muslim emperor of a largely non-Muslim state, Akbar actively worked to breach the gap between ruler and subject in Rajasthan and elsewhere. He abolished the *jizya*, a head tax for non-Muslims, and he sought religious and philosophical consultation from representatives of many religions including Hinduism, Jainism, Buddhism, Zoroastrianism, and even Christianity. Akbar's patronage of the arts also extended to non-Muslim contributors, especially Rajput painters and architects. The architectural syncretism of Akbar's capital in Fatepuhr Sikri also reflects the eclectic influence of Rajput, Mughal, Persian, Afghan, Jain, and Hindu styles.

Akbar's subjugation of Rajasthan and other kingdoms reflected a multifaceted tactic of military conquest and diplomatic negotiation that worked to create a new composite political order characterized by accommodation and inclusion. Many histories of the Mughal empire written during the British colonial period and more contemporary polemic appraisals have characterized the Mughals as oriental despots seeking plunder and conversion by the sword. However, the historical record of Akbar and his incorporation of Rajputs into the imperial state machinery suggests that early Mughal statecraft was a more creative, pragmatic, and inclusive endeavor.

The Mughal Invasion of the Deccan and the Maratha Response

First under the Mughal rule of his father Shah Jahan (r. 1627–1658) and then as the emperor himself, Aurangzeb (r. 1658–1707), also known as Alamgir, solidified Mughal power in the Deccan. Aurangzeb's reign initiated an era of both expanding Mughal scope and power and of fracturing cohesion, indicating imperial weakening. Aurangzeb has been maligned for practicing a brutal form of control, particularly targeting non-Muslim populations and even non-Sunni Muslims. With the same fervor he brought the loosely united Deccan sultanates directly under Mughal rule, which encouraged minorities to rebel against his intensifying power. In particular, Aurangzeb's foray into the Deccan is directly responsible for the rise of the Marathas in the western Ghats and around Pune as a concerted enemy of the Mughal state.

At the time of Shah Jahan's decision to annex the Deccan, the region was divided into three kingdoms: Ahmednagar, Bijapur, and Golconda. All three were Muslim states, and large numbers of Shia also inhabited the area, which was a considerable irritation to the orthodox Aurangzeb. His first attempts to subdue the area were frustrated by his elder brother Dara Shikoh, who convinced Shah Jahan to withdraw Mughal forces from the Golconda fort. Aurangzeb had to bide his time until 1658, when he defeated his brother, dispatched other claimants to the throne, and placed his father under house arrest until his death in 1666.

Rather than facing the prospect of war, Bijapur accepted Mughal suzerainty for which

it received as a reward the western Ghats and Pune, now the heartland of Marathas, wherein they founded a new Maratha kingdom under the Maratha hero Shivaji. Because of this new kingdom's direct proximity with the Deccan and the difficult terrain to control, the Marathas became a great concern for the Mughal empire. In the mid-1600s the Marathas formed a confederacy behind the charismatic Yavada ruler Shivaji (Shivaji). Shivaji challenged the Muslim oppression of the Hindus and led the Marathas in an uprising against the Muslim kingdom of Bijapur during 1655–1659. That victory enabled the Marathas to establish an independent state in the western Ghat mountains. Alarmed by Shivaji's success, the Mughal emperor Aurangzeb sent an army against him, but Shivaji's daring midnight attack defeated it. In 1664 Shivaji's forces sacked Surat, one of the largest Mughal ports, taking immense booty. In response Aurangzeb dispatched one of his ablest generals, Mirza Raja Jai Singh, with some 100,000 men. Jai Singh pursued Shivaji to Bijapur, where he defeated and forced him to sue for peace at Purandhar in 1665. The Maratha leader agreed to surrender most of his fortresses and pay compensation. He then traveled to Agra to pledge his allegiance to the Mughal ruler but was placed under house arrest inside the palace. Nevertheless, he escaped in August 1666 and rallied his supporters against the Mughals. Over the next two years he not only had won back all the lost territory but also had significantly expanded his realm, reorganizing his army and collecting taxes from Mughal regions. He sacked Surat a second time in 1670 and invaded Khandesh and Berar. Although the arrival of Mughal reinforcements, under Bahadur Khan, checked the Maratha's expansion by 1672, Shivaji turned his attention to Bijapur, Golconda, and Jinji and neighboring territories. He was the first Indian ruler to establish a naval force, which he used for defense and trade. In 1674 Shivaji proclaimed himself an independent sovereign (Chatrapati), but his rule proved to be short-lived. In April 1680 he died of illness in his mountain stronghold of Rajgarh.

In co-opting his enemy Shivaji, Aurangzeb was following a time-honored Mughal practice of integrating hostile elements into the empire. However, in the second half of his reign Aurangzeb's attitude toward the non-Muslim subjects

of his empire began to harden. In the late 1680s he went to war against the Marathas, this time led by Shivaji's son Sambhaji, who provided shelter to the rebellious Crown Prince Muhammad Akbar, the son of Aurangzeb, which provoked hostilities with the Mughal emperor. In 1681 Aurangzeb and his enormous courts (said to be numbering half a million men) came to the Deccan, where they stayed for the next quarter of a century. Aurangzeb conquered the Deccan kingdoms of Bijapur and Golconda during 1686–1687 and then turned his attention to the Marathas. In early 1689 Sambhaji was betrayed by one of his companions, who helped the Mughal forces locate and capture him at Sangameshwar. Following Sambhaji's execution in March 1689, Aurangzeb tried to absorb his kingdom but was unable to suppress the Marathas, who fought a protracted war of resistance with guerrilla tactics that kept Aurangzeb's troops committed but victory elusive. As Aurangzeb became mired deeper in the Maratha war, his control over his northern territories slackened. By the latter half of the 1700s the Marathas, with their organized military force opposed to Mughal rule, controlled the most territory, resources, and forces outside of the Mughal reach itself. The continuation of Mughal policies, particularly those aimed at non-Muslim minorities like the Sikhs, continued with Aurangzeb's son and successor Bahadur Shah (r. 1707–1712), leading to further fractures and driving local leaders to claim more autonomy.

Constructing Empire— Portuguese Ideas of Expansion, Particularly toward the East

European expansion, which later led to colonialism, began in the early fifteenth century when Portugal conquered the city of Ceuta, in

Morocco. A maritime kingdom, Portugal was the first to venture into the ocean because of its relative political stability in comparison with its contemporaries. Also, Prince Henry “the Navigator” was eager to make his fortune through obtaining the rights to commodities found in the lands discovered. Although he never actually sailed on any of the expeditions, his willfulness is what drove the caravels down the eastern coast of Africa. The lure of African gold that had, up until this point, only been traded by the Muslim and Jewish merchants, kept the Portuguese moving south despite the difficulties they encountered. They eventually did discover gold in the famous “gold coast,” but their southward journey did not stop. By the time João II became king, the goals had changed. By the late fifteenth century, they started to believe that rounding the southern tip of Africa would lead them to Asia. Finding a sea route to Asia would catapult the Portuguese into becoming the leaders of the spice trade in Europe and going to the Spice Islands by sea was cheaper, faster, and safer than going the traditional land route of the Muslims. This dream was realized in 1488 when Bartolomeu Dias rounded the southern tip of Africa, a place he would dub the “Cape of Storms” for the poor weather and rough waters he encountered there. The king would name it officially the “Cape of Good Hope” to symbolize the fortune they hoped to find on the other side. Dias would have gone all the way to India, but his crew mutinied, and he was forced to turn back. Finally, Vasco da Gama captained an expedition and finally reached India in 1498. Other European countries, especially Spain, had been attempting to finance their own explorations, but this was stopped by a bull from Pope Nicholas V in 1455 entitled *Romanus Pontifex*, which threatened ex-communication to any non-Portuguese vessels as it proclaimed everything south of the Canary Islands the realm of the Portuguese. This was later confirmed in 1497 with the Treaty of Tordesillas, which drew a line of demarcation 370 leagues west of the Cape Verde Islands, effectively giving everything east of that line to the Portuguese, and the rest to the Spanish.

The original empire that Portugal created was one of a series of trading posts rather than an empire of conquest, as the Spanish created. This phenomenon occurred not because the

Portuguese were necessarily nicer than the Spanish, but circumstances led to such maneuvers. As a small country, Portugal did not have enough people to even populate the Azores and Madeira Islands, let alone the numerous other trading posts they built along the coasts of Africa and Asia. Even if they had the population, neither the Portuguese, nor any of the Europeans, had the military technology to be able to forcibly take any of these areas because of the distance required to travel, and the fact that the Asian trading posts were all established in places where people already lived. The presence of powerful empires in the region prevented the Portuguese from even thinking of attempting a military conquest. As a result, the Portuguese mainly concentrated on trading spices and other luxuries from the east, and the king used this to make the treasury quite rich. With the expansion into the east came the inevitable arrival of missionaries. The Franciscans, Dominicans, and Jesuits all sent out missionaries to the various lands of the east, for the purposes of converting the people to Christianity. The Jesuits in particular were quite successful, converting thousands of people in India and Japan. The success led them to believe that in addition to making enormous profits, they were also doing God's work in the process. Despite this, the Portuguese were never truly able to expand in the east as they did in the west and in Africa, although they had quite an influence. Even after the Portuguese were replaced by the Dutch as the primary traders of spice in Asia, the Portuguese culture remained long past the exit of the Dutch in the nineteenth century.

Spanish Settlement of the Antilles

Upon the encounter by Christopher Columbus (1451–1506) with the New World in 1492, the fate of the Spanish Antilles would be characterized by demographic catastrophe resulting in

the deaths of thousands of indigenous peoples. The Spanish Antilles, composed of Spanish dominions in the Caribbean Sea that included such islands as Cuba, Puerto Rico, and Hispaniola, were settled by the Spanish in the early sixteenth century as part of the first wave of European settlement in the New World. The depletion of the Antilles' natives due to Spanish mistreatment, slavery, and disease resulted in the need to import African slaves to work the cash crop economies developing in the Caribbean colonies. The shift from indigenous to African coerced labor would have immense consequences for the subsequent history of the New World.

A group of islands, similar to the Antilles, existed in the minds of Europeans prior to Columbus's voyage. It had previously appeared in medieval maps as a collection of islands somewhere within a large area between the Canary Islands and India. Some scholars suggest that the term "Antilles" is a corruption of the lost continent of Atlantis. Following the 1492 arrival of Columbus, Europeans acknowledged that the dispersed lands consisted of an extensive archipelago within the Caribbean Sea and the Gulf of Mexico. As a result, the term "Antilles" was commonly assigned to this geographic region, and the term "Sea of the Antilles" entered common usage as an alternate name for the Caribbean Sea.

The initial contact between the Spanish and the native Arawak people of the Antilles was fraught with conflict. The expeditions that Columbus and others had taken to the Caribbean were intent on establishing their dominion and extracting wealth for the glory of Spain. Many of the Spanish cadres on these exploratory expeditions were composed of Castilian soldiers, veterans of the Reconquista in the south of Spain. Their familiarity with non-Christian "heathens" was relegated to Muslim Moors, whom they abhorred intensely. These men went to the New World with their old prejudices and worldviews, and the consequences would prove to be devastating for the native Arawaks. The Spanish imposed their rule and enslaved many of the natives, resulting in a series of rebellions violently repressed by Spanish arms.

The development of a massive agrarian enterprises in Spanish America, known as the *encomienda* system of land distribution, also

THE DEVASTATION OF THE INDIES: A BRIEF ACCOUNT

Bartolomeo De Las Casas (1474–1566) was a Spanish cleric who had formerly owned an *encomienda* in the New World and had been witness to the Spanish exploitation and enslavement of the natives. His recommendation was to replace natives with African slavery, which he regretted later in his life.

“The common ways mainly employed by the Spaniards who call themselves Christian and who have gone there to extirpate those pitiful nations and wipe them off the earth is by unjustly waging cruel and bloody wars. Then, when they have slain all those who fought for their lives or to escape the tortures they would have to endure, that is to say, when they have slain all the native rulers and young men (since the Spaniards usually spare only the women and children, who are subjected to the hardest and bitterest servitude ever suffered by man or beast), they enslave any survivors. With these infernal methods of tyranny they debase and weaken countless numbers of those pitiful Indian nations.

From that time onward the Indians began to seek ways to throw the Christians out of their lands. They took up arms, but their weapons were very weak and of little service in offense and still less in defense. (Because of this, the wars of the Indians against each other are little more than games played by children.) And the Christians, with their horses and swords and pikes began to carry out massacres and strange cruelties against them. They attacked the towns and spared neither the children nor the aged nor pregnant women nor women in childbed, not only stabbing them and dismembering them but cutting them to pieces as if dealing with sheep in the slaughter house.”

Bartolomeo De Las Casas, *The Devastation of the Indies: A Brief Account*, translated by Herma Briffault (Baltimore: Johns Hopkins University Press, 1982), 31–32.

caused enormous problems for the Arawaks. This system consisted of massive tracts of land distributed to Spanish colonists and included the enslavement of the local indigenous people. In tandem with mistreatment by their new Spanish overlords, subject to long hours working in the developing cash crop economies of the Caribbean, the rising death toll of the Arawaks resulted in their near annihilation. Many died from the introduction of European diseases such as smallpox and measles, as the Arawaks had little resistance to these new diseases.

The Spanish colonial administration also consisted of Catholic officials sent to convert the indigenous peoples to Christianity. Many of these officials looked apprehensively at this system of exploitation of the local populations and advocated against it back in Spain. The *encomienda* system of the Antilles, which eliminated nearly the entire population, was used as a key example in the criticisms of these clergymen. The debate over whether native peoples possessed souls and could be converted to Christianity

also played a role in their arguments. Ultimately, Bartolomeo De Las Casas (1474–1566), an advocate for the rights of American indigenous peoples, proposed that rather than enslave Native Americans, *encomendados* should import African slaves. The argument was that African slaves were better adapted to the harsh climatic conditions characteristic of the Caribbean sugar plantations. With papal backing, the New Laws of 1542 were passed in the Spanish dominions to prevent the exploitation and enslavement of Native Americans. The implementation of these laws was lax, and they were ignored for the most part. However, they did result in the growing importance of the importation of African slaves and the subsequent importance of the slave trade to the economy of Spanish America.

English, Dutch, and French incursions into the Spanish Caribbean, coupled with wars in Europe, resulted in their growing influence in the region and eventual possession of some of the former Spanish dominions in the Antilles. Their emerging presence in the New World also built

on the legacy of the African slave trade and the use of the slave trade in cash crop economies.

Portuguese Settlement of Brazil

Until 1492, the Portuguese had been leading Europe in the Age of Discovery. The Portuguese had already sent their ships around the coast of Africa and were only six years away from reaching India. The Castilian queen, Isabel, desperate to catch up to the Portuguese, funded what seemed to many a foolish scheme: Christopher Columbus's expedition to find a western route to Asia. Instead Columbus encountered a new continent, and King Fernando and Queen Isabel were quick to send men to explore this new land. The Portuguese king, Manuel I, was not to be left behind and, thanks to the Treaty

of Tordesillas that allowed the Portuguese to explore the eastern part of the continent, was not far behind in sending ships west.

In 1500 an expedition led by Pedro Álvares Cabral landed on the shores of northeastern Brazil. The expedition included 13 ships and more than 1,000 men. Despite the enormity of the territory that would eventually encompass Brazil, the Portuguese king would not pay much attention to it at first. Unlike the other parts of South America, it was not immediately obvious what riches Brazil would provide for Portugal. The only thing that was found was brazilwood, a tree that could be processed in order to make dye for textiles. Seeing that Brazil was not going to give an immediate payout, King João III decided to move away from the royal monopoly and created 15 hereditary captaincies in order to cut administrative costs. These captaincies were given to various noblemen as rewards, which allowed them to administer their territories and the people in them as they chose, but they were required to pay 20 percent, or the *quinto*, to the king. However, most of these captaincies failed except for Pernambuco and São Vicente. Pernambuco only prospered because of the building of sugarcane mills, and after this sugar became Brazil's main export until the end of the seventeenth century.

With the failure of the captaincies, the Crown reverted Brazil's administration to royal control. In 1549 King João III sent Tomé de Sousa to establish a governorship and a capital, Salvador de Bahia. During this time the Portuguese met with trouble from both the French and the Dutch, who attempted to subvert Portuguese business by sending their own men in to trade with the native Tupi. This indigenous people, fewer in number than the other great civilizations of Ibero-America and living mostly in the interior, offered little resistance, making it easier for the Portuguese to settle in Brazil. Despite royal control, settlers continued to try to enslave the Tupi, efforts that largely failed because the natives too frequently escaped or died from oppressive labor conditions. Sousa also brought to Brazil the first Jesuits, who became another obstacle to the enslavement of the natives. Jesuit missionaries protested against the abuse of the Tupi and fostered their Christianization. Finally,

➤ HOW TASTY WAS MY LITTLE FRENCHMAN?

While the Portuguese attempted to settle Brazil, the Dutch and French were also attempting to encroach. The Tupi, the indigenous people of Brazil, were a single nation but divided into different ethnic groups who often warred with each other, and the European traders were able to use these rivalries to their own advantage. A particularly fierce rivalry occurred between the Tupinambas, who were allied with the French, and the Tupiniquins, allied with the Portuguese. Prisoners captured as a result of these wars were often killed in anthropophagic rituals, what is more commonly known as cannibalism. Once a person was eaten, those who had taken part in the ritual would then take on a new name, as they believed that the ritual changed them.

An eyewitness account came in the form of Hans Staden, a German gunner who was captured by the Tupinamba in 1554. According to Staden, the Tupinamba captured him while he was out hunting with his slave and mistakenly thought he was Portuguese. He was abducted by two brothers whose father had been killed by the Portuguese and were looking for revenge. The brothers presented Staden to their uncle, who told him that he would be ritually eaten after the appropriate

preparations. Staden claimed to be French because he knew that the Tupinamba were friendly with the French, and he hoped that if they found a Frenchman, he would verify Staden's story in order to save a fellow European and Christian. A Frenchman was found, a man who had been adopted as a "son" by a man in the next village. Staden was disappointed when the man told the Tupinamba that Staden had not understood a word of the French he had spoken to Staden. Despite this setback, Staden was eventually able to convince the Tupinamba that he was indeed not Portuguese, even if he was not French. Over the next year, Staden escaped and was recaptured several times. Eventually he was able to return to Germany, where he wrote *True Story and Description of a Country of Wild, Naked, Grim, Man-eating People in the New World, America* in 1557. This account confirmed what Europeans already thought of indigenous Americans: cruel, wild, and cannibalistic. Some historians claim that Staden's accounts of the cannibalistic rituals are exaggerated and unrealistic; nevertheless, his account provides some important information on the Tupi people and their relationships with the Europeans.

—Monique Vallance

relatively few Portuguese settled in Brazil, and those who did often intermarried with indigenous women.

More changes transformed the administration of Brazil through the seventeenth century. During the 60-year Habsburg reign over Portugal, King Philip II split Brazil into two *estados* ("states"): the Estado do Brasil and the Estado de Maranhão. Once the Spanish were overthrown in 1640 the system was kept, but the governors began referring to themselves as viceroys. In the 1690s gold was discovered in Minas Gerais, which changed the economy of Brazil from sugar-based to gold-based and dramatically increased imports of African slaves. In addition, settlers in Brazil's southern regions encroached on Spanish territory in order to gain more resources. In 1679 Manuel Lobo founded the Colônia de Sacramento, an important fort as well as a center for black market trading among Spanish

and Portuguese alike. Although the Portuguese and Spanish would fight over it several times, the town remained a part of Brazil.

Portugal's settlement of Brazil differed from the colonization of other European powers in the Americas. Although conflict with indigenous peoples was minimal, it took almost 200 years before the colony became a lucrative resource for the Portuguese. The settlement of Brazil would also be the jumping-off point for the African slave trade; over 4 million slaves were brought to Brazil in the 300 years of colonial history.

Revolutionary Currents— Development of Representation

Regardless of the claims made by “enlightened” absolutist monarchs (Catherine II of Russia, Joseph II of Austria, and Frederick II of Prussia) that the interests of their subject peoples were heeded through their divine authority, in actuality many polities in Europe retained tightly reigned monarchical structures despite the popularity of the political discourses of the Enlightenment. However, significant developments in Britain and in its American colonies illustrated

the establishment of representative institutions as inspired by political thinkers such as Baron de Montesquieu, John Locke, and Thomas Hobbes. The “mother of Parliaments” in England managed to put itself at the forefront of the formation of public policy after slowly taking it from the Hanoverian monarchs, who were distracted by the politics of the Holy Roman Empire. The ebbing power of the monarchy in England had already been slowly devolved to Parliament since the days of the English Civil War (1642–1651) and the Glorious Revolution (1688). In British America colonial representative institutions, which were modeled on English political structures, were also established, setting the precedent for the subsequent independent American republic.

The English Civil War brought the obstinate advocate of monarchical divine right, Charles I, to confront Parliament, which was unwilling to give up its traditional legal privileges in the running of the English realm. The defeat of Charles I and his royalist Cavalier supporters did not end the prospect of an English absolutist state but actually brought it into existence through the establishment of the Cromwellian Protectorate. Oliver Cromwell, designating himself lord protector, dissolved Parliament due to his suspicions of potential dissension and political chaos following the end of the English Civil War. After the collapse of the Protectorate shortly after Cromwell’s death, Charles II was restored to the kingship with greater limitations to his power. However, his successor, the fiercely Catholic James II, much like his grandfather James I and father Charles I, believed that it was his duty to restore the English Crown’s absolute right to govern the realm free from the restrictions imposed by English law and the agency of Parliament.

Nonetheless, James II was replaced in 1688 by William of Orange, the Dutch (United Provinces) stadtholder who was the husband of the sister of James II. This event, known as the Glorious Revolution, thereby established England as a constitutional monarchy in which the king was bound to share political power with Parliament and was bound to English law. Subsequently, Parliament’s power steadily increased at the expense of the Crown, particularly under the rule of the Hanoverian kings (George I, George II,

► ELECTION OF THE HOLY ROMAN EMPEROR— THE ROLE OF THE ELECTORS

While the election of the Holy Roman Emperor, who symbolically ruled over the German realms of Central Europe, along with Bohemia, Hungary, Transylvania, and smaller Italian states and principalities, gave electors symbolic political power over the selection of the sovereign, it did not form the establishment of a body that truly represented the majority of the people. Electors, since the papal Golden Bull of 1356 that established this voting process, were a small group of hereditary nobility who ruled directly over their lands with little to no regard for the desires of the emperor. The emperor, typically a Habsburg who already ruled directly over Austria, Bohemia, and Hungary as well as smaller territorial enclaves in Central Europe, was fully aware of his circumscribed political position. Many of these electors, such as the elector of Brandenburg (later Prussia) and the elector of the Palatine, the elector of Saxony, or the elector of Bavaria, were kings or high nobles in their own right, contending at times for power with the emperor himself. Despite the continuity of the figurehead position of the Holy Roman Emperor well until 1806, the disparate Central European kingdoms held their own amid attempts by the Habsburgs (e.g., Thirty Years’ War) to centralize their power.

—Abraham O. Mendoza

and George III), who as German princes were more inclined to involve themselves in continental affairs and allow the English Parliament greater agency in domestic and foreign policy. The establishment and growing power of English political parties, the Tories and the Whigs, allowed for greater political participation of the upper echelons of British society, which consisted of mainly aristocrats and very wealthy commoners. In the late eighteenth century the development of the office of prime minister and the institution of the cabinet were firmly embedded in the representative institutions of late early modern Britain.

Across the Atlantic, British America, since its inception in 1607 at the founding of Jamestown and the founding of the Massachusetts Bay Colony in 1620, had developed representative institutions characterized by the inclusion of landholders, townsmen, and merchants as voters and active participants in government. While women, African slaves, indentured servants, and children were excluded from the vote and had little to no political rights, there were greater opportunities for freemen to attain representation vis-à-vis colonial governments. The House of Burgesses in Virginia, first elected in 1619, is an indication of the popular awareness of Enlightenment political ideals by wealthy colonial elites. Most of these colonial representative governments, in Virginia, New York, and Massachusetts, were modeled on the British two-house legislature composed of the House of Lords and the House of Commons. While loosely bound to the English Crown and Parliament through national sentiment, trade interests, and defense purposes, these autonomous legislatures were de facto sovereign entities that would fight British authorities after 1776 to defend their rights when Crown and Parliament would try to institute taxation measures after nearly a century of neglect.

Arena for Conquest— Early Modern Italy

Italy was a site of conquest and occupation by foreign powers throughout the early modern era. Beginning with the French invasion in 1494 and ending only with unification in the nineteenth century, Italy found itself prey to French, Spanish, and Austrian rule. The conquest that resulted in both the destruction and dispersion of the Italian Renaissance also laid the political, technological, and military foundations for European hegemony in the wider world.

When the French invaded Italy in 1494, many Italians wondered how a people they considered medieval and barbaric could so easily conquer a more advanced and sophisticated civilization. However backward they appeared to the Italians, the French under the young king Charles VIII were unified, prosperous, and strong, while Italy remained divided politically into a number of independent states. As each sought to expand its own power at the expense of the others, no one city-state had the strength to stand up to the massive new monarchies beyond the Alps.

Fifteenth-century Italy was divided into three major regions: feudal domains in the south, Papal States in the middle, and independent

Holy Roman Emperor Charles V defeats French king Francis I at the Battle of Pavia in February, 1525. The battle was a decisive event in the struggle between the Habsburg and Valois dynasties over control of Italy. (Hulton Archive/Getty Images)

➤ MACHIAVELLI ON LIBERTY AND EMPIRE

In these passages, Machiavelli makes the argument that the common good is cherished by republican governments more than by princes. He argues also that free citizens in a republic are more able to attain greatness or empire. However, there is a central irony here because the freedom that allows one state to conquer another necessarily deprives the other state of its liberty. Historians still debate which Machiavelli valued more, liberty or empire.

“2. It is easy to see how this love for a free life arises in peoples, because experience shows that cities never have grown in dominion and riches except when they have lived in freedom. Truly it is wonderful to observe what greatness Athens attained in the space of a hundred years, after she liberated herself from the tyranny of Pisistratus. And it is much more wonderful to observe what greatness Rome attained after she liberated herself from her kings. The reason is easy to grasp, because what makes cities great is not individual good but the common good. And beyond doubt this common good is attended to only in republics,

because all that advances it is put into execution. Even though it does harm to this or that private person, there are so many whom the said common good benefits, that they are able to go ahead in opposition to the wishes of those few who are injured by it. . . .

3. The contrary happens when there is a prince, for in most instances what benefits him injures the city, and what benefits the city injures him. Hence when a tyranny is set up over a free community, the least evil it can bring to such cities is that they make no more progress and do not increase further in power or wealth; generally, or rather always, it happens that they go backward.”

—Rebecca Boone

city-states in the north. The latter included the duchies of Savoy and Milan as well as the republics of Florence, Genoa, and Venice. In 1494 Ludovico Sforza, the tyrannical duke of Milan, invited the French army into the peninsula to make good on a claim to Naples and to attack his rivals. Although he simply continued the tradition of seeking temporary foreign intervention in local disputes, this time the French decided to stay and conquer the entire peninsula. Equipped with new mobile artillery and strengthened by the tight infantry formations of Swiss mercenaries, the French army faced almost no military opposition from the Italians. Some states surrendered without a fight, terrified by a brutality never before seen in previous Italian conflicts. Other states welcomed the French as liberators from traditional enemies until, that is, the French occupation became oppressive and intolerable.

To counter the threat from France, several states invited the Spanish army, led by Maximilian I, into Italy to defeat the French. The Italian

Wars, fought between the Spanish Habsburg and French Valois dynasties, lasted from 1494 to 1559. The Spanish, with organized battle formations and effective use of the arquebus, a kind of primitive musket, finally pushed the French from the peninsula. The Treaty of Cateau-Cambrésis (1559) established direct Spanish rule over Milan, Naples, Sicily, and Sardinia and reduced previously independent republics to satellite status. Most notably, Spanish domination ended the long tradition of republican government in Florence. Venice, however, survived as an independent republic until the Napoleonic era. After the war of Spanish Succession in 1714, Austria replaced Spain as the dominant force in northern Italy.

The Italian Wars contributed to the dispersion of Italian Renaissance culture throughout Europe. Italian artists, architects, and engineers (Leonardo da Vinci among them) brought their talents and perspective to northern courts. In an age before nationalist sentiment, talented and knowledgeable Italians often showed little loyalty

to their own states and offered their services to patrons north of the Alps. In fact, many Italian elites, including generals, diplomats, and government officials, used their expertise to carry out the foreign domination of their own homeland.

The invasion of Italy had enormous consequences for the theory and practice of conquest. Vast infantry formations rendered obsolete the knight on horseback, and modern warfare engendered the modern bureaucratic state. The wars also gave birth to political science, as occupational governments led to a crisis of political legitimacy. The Florentine political thinker Nicolò Machiavelli, in an effort to find meaning in the chaos and disorder of contemporary events, was moved to provide the first objective analysis of power. He also sought solutions to the problem of political liberty. To him, the destruction of Florentine self-government was a result of moral weakness in his fellow citizens, a lack of *virtù*, loosely defined as courageous dedication to the political community. Contemporary Italians generally showed little appreciation for the role of superior technology, organization, and resources in the military success of France and Spain.

For the victors, the conquest of Italy provided a training ground for empire. When Cortés and Pizarro conquered and destroyed the great empires of the Aztecs and Incas to establish a lasting dominion in the new world, they did so with the skills, technology, and veteran soldiers of the Italian Wars. The lessons of hegemony would be used repeatedly as the European powers extended their reach all over the globe centuries afterward.

The Language of Conquest in Early Modern Europe

The term “conquest,” meaning acquisition by force of arms, usually refers to a military operation with the goal of expanding territory. There was nothing new about the desire for states, kingdoms, and principalities to expand during 1450 and 1750. However, the way that wars of aggression were waged and the manner in which they were justified changed dramatically in the first global era. Western Europe inherited a theory of conquest from the Roman empire that was modified by legal scholars in the Middle Ages. The language of conquest later evolved to suit the interests of the two most important colonizing forces of early modern Europe: the Spanish and British empires.

Medieval ideas about so-called just war defended wars of aggression if they involved the claim of territories acquired legitimately by marriage or inheritance. The confusing nature of feudal law almost ensured a steady flow of contesting claims to territory and hence a state of almost constant warfare. Both the Hundred Years’ War (1337–1453) and the French invasion of Italy (1494) were examples of just wars based on feudal claims, even though both aimed at the conquest of foreign territory.

The revival of Roman law in the High Middle Ages also revived the Roman language of conquest. In this language, conquest was connected to the idea of *imperium*, or authority. The word “imperium” originally referred to the authority of Roman magistrates but gained the sense of military command by the time of Augustus. By the end of the empire the term “imperium” meant unlimited authority in both the civil and military spheres. Eventually the term “imperium” referred to the ultimate indivisible authority that the Romans claimed over an expanded territory that included various peoples. This was the Imperium Romanum, or Roman empire. The unquestioned legitimacy of the Roman empire automatically justified the aggressive wars that created it.

The emergence of the Roman concept of empire in the Renaissance greatly altered the language of conquest. By the sixteenth century,

empire was described as both natural and universal. In the writings of Machiavelli one sees the term “empire” used to describe a state organically destined to grow. Thus, conquest became necessary for states seeking *grandezza*, or greatness. In his description of the natural progression from state to empire, Machiavelli did not attempt to include a moral justification of conquest. However, his advice on how this could be done was extremely influential to early modern rulers and developed into the amoral political language known as “reason of state” most famously practiced by Cardinal Richelieu in the seventeenth century. In this way, aggressive war became the natural outgrowth of the nation-state.

Because the Roman empire claimed to encompass the entire known world, its rulers claimed an authority that was universal in scope. Medieval jurists claimed the Holy Roman emperor to be *de jure* lord of all the world, or *dominus mundi*. As the ruler of a Christian empire, the Holy Roman emperor claimed divine authority. In reality, medieval emperors were unable to establish universal rule due to their lack of military power. However, by the sixteenth century innovations in military technology, strategy, and bureaucracy provided rulers with greater military force. For example, the Spanish king turned Holy Roman emperor Charles V (1500–1558) had both the will and the resources to try to conquer and make good his claim to universal rule. His wars of conquest resulted in the domination of Italy and the establishment of an overseas empire in the Americas. The imperial language of the Spanish empire defended aggressive war as God’s will.

The conquest of the Americas brought several new considerations into the theory of conquest. Like the Romans and the Chinese, early modern Europeans tended to define the status of those outside of their civilization as barbarian. They followed the lead of Cicero, who claimed that those outside of Roman civilization were by nature fit only for servitude and that they benefited from Roman domination. When Christianity replaced civility as the defining feature of the Roman empire in the Middle Ages, it provided a defense for the conquest of non-Christians, both pagan and “infidel.” This attitude appeared in

the predatory nature of Portuguese trade in the fourteenth and fifteenth centuries (promoted as a Crusade to take resources from the infidels) and in the Spanish conquest of the Americas. The Spanish empire remained tied to the Christianizing mission until its end, although the desire for gold and glory undoubtedly also played a major role in its existence.

In the sixteenth and seventeenth centuries the right of conquest extended within Christendom as a result of the Protestant Reformation. The right to wage war against heretics, whether Protestants or Catholics, went largely unchallenged. Much gold from the New World was funneled into Spanish attempts to reclaim large areas of central Europe and the Low Countries for the Catholic Church. Religious warfare raged throughout England, France, and central Europe until the end of the seventeenth century, when religious passions died down and wars once again concerned the acquisition of territory.

A new justification of conquest emerged with the rise of the British Empire in the seventeenth and eighteenth centuries. By that time, a desire to justify conquest on rational and moral grounds replaced the militarism and religious fervor that had sparked earlier conquests. The British defended their empire building with the language of public benefit. Because it was based on sea power, the British Empire could claim itself as being distinct from previous militaristic and land-based empires. This maritime conception of the British Empire focused on commerce rather than war, natural law rather than religion. This accorded well with the change in the nature of the European nobility from a warrior elite to an aristocracy distinguished by the courtly values of taste and education. However, the mind-set that equated civilization with good manners further justified the domination of non-Europeans who, because they lacked these marks of European civility, could be considered less than human and therefore fair game for conquest.

The process of conquest played an important role in creating the nation-state. Not only did it result in the creation of government bureaucracies necessary to mobilize resources for war, but it also served in the creation of national identities as conquerors sought to justify the domination of other peoples. On the other hand,

the urge to expand empires across the globe has played a large role in the rise of globalization. In conclusion, the language of conquest has continued to change until the present, but unfortunately the destructive consequences of conquest remain the same.

The Invasion of Mesoamerica

The Spanish conquest of Mesoamerica, a region that extends south of central Mexico down to Costa Rica, began as settlers in Hispaniola and Cuba searched for a maritime passage to the East. In 1517 the governor of Cuba organized an expedition to sail west, seeking new lands and slaves. The fleet landed in northern Yucatan, where it encountered the sophisticated culture of the Maya. Although Mayan warriors killed or wounded most of the Spaniards, rumors of gold and silver caused great excitement in Cuba. The next year a second expedition learned that a powerful empire, the Aztecs, or Mexica, had recently conquered the region. The task of exploring and conquering these lands went to Hernán Cortés, a successful Spanish captain who had arrived in the West Indies 15 years earlier.

In March 1519 Cortés and 550 conquistadores landed in the Tabasco River. The Maya attacked the Spaniards but, unable to defeat them, offered them gold and young women, among them Malintzin, or Malinche, who spoke Maya and Aztec and was knowledgeable of the natives' customs. Called Doña Marina by the Spaniards,

she became Cortés' mistress and played a key role in the conquest of Mexico.

Other Indian groups that felt oppressed by Aztec domination joined the Spaniards. The king of Cempoala welcomed Cortés and told him about the resentment toward the Aztecs due to their demands for tribute and sacrificial victims. Indeed, the Aztec control of the area relied largely on the cruel repression of local rebellions. Meanwhile, Montezuma II, the Aztec leader, unsure whether the newcomers were gods or humans, pursued a cautious response. Cortés took advantage of the emperor's indecisiveness, intimidating the Indians with the use of European weapons, horses, and dogs while assuring the Aztec ambassadors of his good intentions.

The Spaniards began their progress toward Tenochtitlan, the Aztec capital, in August 1519. Montezuma allowed the Spanish army to march up to the sacred city of Cholula, where the Aztecs planned to annihilate them. Cortés, however, learned of the scheme and had the Cholulan leaders executed. A massacre of thousands of commoners, including women and children, ensued while the city was burned and looted. Apparently convinced of the futility of any resistance, a few days later Montezuma invited Cortés to Tenochtitlan. In November 1519 the Spaniards entered the Aztec capital, built in the middle of Lake Texcoco.

The Aztec emperor received the Spaniards with full honors. Enclosed in a city linked to the mainland by four causeways, the Spaniards were aware of their vulnerability. Seeking to strengthen their position, they took Montezuma hostage. In an effort to avoid a rebellion among the army officers, the emperor insisted that this was his own decision. In fact, he managed to prevent a major crisis, which only unfolded after Cortés was forced to abandon Tenochtitlan to confront a Cuban fleet pursuing him.

During Cortés' absence, the Spanish captain in Tenochtitlan, Pedro de Alvarado, interpreted a religious celebration as preparation for war and ordered an attack. After that the Spaniards, who had murdered almost all of the military elite, confronted a major Aztec uprising. Upon his return, Cortés had Montezuma address his people. During the melee the Aztec king was injured and died soon afterward. A secret sortie through

➤ CORTÉS IN TENOCHTITLAN

Twenty years old, Bernal Díaz del Castillo was one of the soldiers who participated in the conquest of Mexico between 1519 and 1521. An active participant in the invasion, he claimed to give an accurate description of the events in his *Verdadera Historia de la Conquista de Nueva España*, although he wrote it nearly half a century later.

“That country was thickly populated and we marched by short journeys, commending ourselves to God and His Good Mother, our Lady, and talked about how we should enter the city, while our hearts filled with hope that . . . Our Lord Jesus Christ . . . would protect us from the power of Mexico. . . . The next day . . . we took the causeway, which here was eight paces wide and led directly to the city of Mexico. . . . It was so filled with people . . . that we could hardly pass. . . . We didn’t know what to say or whether it was real. . . . We were going to the great city of Mexico numbering less than four hundred soldiers. . . . When we came close to Mexico, Montezuma descended from his litter while the great chiefs supported him with their arms beneath a marvelously rich canopy of green feathers worked with gold, and silver. . . . There were four other chiefs . . . and many other lords who walked before the great Montezuma sweeping the ground where he would pass . . . and putting down mats so he would not have to walk on the ground . . . When Cortés saw the great Montezuma approaching, he jumped from his horse and they showed great respect toward each other.”

—Ana Maria Kapelusz-Poppi

the causeways was now the only way out for the Spaniards. However, as they were attacked by thousands of canoes half of the Spaniards died in what they later called the “Sad Night” on June 30, 1520.

Cortés now realized that the conquest of Tenochtitlan depended on his control of the waterways. With the help of the Tlaxcalans, the Aztecs’ traditional enemies, the Spaniards built a small navy. Also during that time the European diseases carried by the invaders decimated the immunologically defenseless native population. Montezuma’s heir, who died of smallpox

a few days after assuming the throne, was one of the first among thousands of victims. In May 1521 the Spaniards began a new attack. Thanks to their fleet, they rapidly gained control of the lake and laid siege to the city. Under the lead of Cuahutemoc, one of Montezuma’s nephews, the Aztecs resisted for nearly three months, until the Spaniards demolished Tenochtitlan.

The conquistadores now controlled the core of the empire. Efforts to subdue the rest of Mesoamerica were one of the outcomes of the fall of the Aztecs, as Cortés’ associates continued to search for land, slaves, and treasures. Terror and abuse combined with disease annihilated much of the local population or forced indigenous Maya to flee into the forest.

The Portuguese Revolt of 1640

The sixteenth century began auspiciously for Portugal but ended very badly. Portuguese fortunes began to wane during the mid-sixteenth century when King D. Sebastião (Sebastian) decided to mount a crusade in North Africa against the Muslims. Sebastian was fueled by his desire to reclaim lands lost in North Africa by the Portuguese in the previous reign as well as by a crusading spirit fostered by his Jesuit education. Despite protests from his advisers, Sebastian stubbornly forged ahead with his wild plans, taking most of the young nobility with him. This mission ended in total devastation for Portugal when the king along with most of the young Portuguese nobles were killed at the Battle of Alcácer-Quibir in 1578. Sebastian’s gamble brought tragedy for his country. As an only child as well as the only surviving grandson of the

late king João III, Sebastian was the sole direct heir to the Portuguese throne. The only other person with a clear claim to the throne was his 66-year-old great-uncle, Cardinal Henrique. Henrique succeeded his great-nephew to the throne but died in 1580, leaving no heirs. The political vacuum caused a succession crisis that jeopardized Portugal's stability, as outsiders emerged to claim the throne. One of these was the ambitious Philip II of Spain, a grandson of Manuel I. Although Philip did not have the strongest claim, he did manage to win by both bribing the Portuguese nobles and sending in his troops. The conquest was relatively easy, as the strongest of Portugal's fighting forces lay buried in the North African desert.

The next 60 years were not easy for Portugal and its vast empire, now incorporated into the vast Iberian Union. On taking the throne in 1580, Philip had promised that all taxes collected there would be used only for Portugal's needs and that Portuguese soldiers would be deployed only to protect Portuguese possessions. However, the revolt of the Netherlands (1568–1648) and the Thirty Years' War (1618–1648) eroded Madrid's resources, and Philip IV was forced to renege on his grandfather's promise in order to bail out his dwindling treasury and shrinking empire. He ordered the removal of soldiers from critical vulnerable posts, enabling Dutch forces to attack Portuguese overseas territories including Brazil, Angola, and the Spice Islands. The situation worsened for the Spanish kingdoms outside Castile in 1621, when the Count-Duke of Olivares, Philip IV's *valido* (prime minister and counselor), began directing Spain's foreign policy. Olivares wanted to centralize control over the many kingdoms under Spain's dominion around Madrid and Castile. To him, this meant that they should no longer be allowed to use their taxes only for their own purposes but should also contribute to the greater good of imperial Spain, which meant paying for the various wars that it was fighting. This was more than many could handle. When Catalonia revolted in 1640, the equally unhappy Portuguese saw this as a chance to enact their own revolution. First, they would need a king around whom to rally. Rebellion leaders turned to João, the Duke of Bragança, who had been denied the

throne by Habsburg interference in the succession. After much negotiation, João finally agreed to participate in the revolt.

Next, the conspirators synchronized time and place, deciding that the rebellion would begin on December 1, 1640, before the palace of Philip IV's vice-regent, the Duchess of Mantua in Lisbon. At the stroke of nine o'clock in the morning, the rebels burst from their carriages and charged into the palace. One group attacked the Spanish guards at the front, another group secured the vice-regent's secretary, and the final group raced to the windows to proclaim that the revolt had occurred and that the Duke of Bragança was now João IV. The Duchess of Mantua was heard at another window shrieking for help and was only silenced when she was told that she had two options: she could either leave by the door or leave by the window. She left by the door, and the revolt was complete. Word was sent to João that they had been successful, and he arrived in Lisbon from his ducal estates in Vila Viçosa in southern Portugal on December 5. The revolt happened so quickly that when Madrid finally heard what had happened, no one could quite believe it. After some days of confusion, the rumors were finally confirmed by one of João's servants, a man of Castilian birth who was visiting at the time. By 1668, Portugal was recognized as once again independent by all the major European powers and the Catholic Church, and Spain relinquished any hopes it had of repossessing it.

Native American Resistance Movements

As Native American cultures experienced deaths from disease and war as well as pressures from settlers to move off their lands, they began to resist. Though forms of resistance varied, they always had a spiritual dimension. For native people, spiritual or sacred power and political power were integrated. They believed that illnesses and defeat by the European military indicated a loss of spiritual power and also believed that they could gain spiritual power through ritual and strict adherence to native moral principles. Thus, native leaders urged their people to reject European ways, embrace traditional ways, and renew their sacred ceremonies in the hope of rejuvenating the spiritual power they needed to survive.

At first, tribes resisted individually. In the southeast, the Powhatens conducted several small-scale raids against Jamestown, probably to test the strength of and learn more about the invaders. In 1608 Powhatan's brother, Opechancanough, captured Captain John Smith and brought him back to the Powhatan's main village, Werowocomoco. Powhatan had already become acquainted with Smith in his previous bargaining for corn and other provisions. In Smith's account of his captivity, he claims that he was tried before Powhatan and sentenced to death. Smith's life was spared by the intercession of Powhatan's daughter, Pocahontas. Some have disputed this account, alleging that Powhatan staged a mock trial and deliberately planned the rescue for his own purposes. Whatever Powhatan's intentions, he did permit Smith to return to Jamestown.

Powhatan continued to observe the English warily. His warriors harassed the colonists with small-scale attacks. He continued to trade with the colonists, who remained dependent upon the Indians to maintain enough provisions, but became more contentious in dealing with them. In 1614 Englishmen kidnapped Pocahontas in order to recover some of their own people taken in the attacks. The settlers offered a prisoner exchange. Powhatan complied but nevertheless refused to return the stolen weapons that the colonists demanded.

As Native Americans found their economies changing, land bases disappearing, and belief

systems challenged, various communities began to cooperate in their resistance. Another early resistance movement was led by a Wampanoag man named Metacom, also known as Metacomet or Philip to the colonists. After losing his brother due to mistreatment by some Massachusetts soldiers, Philip led a group of resistance fighters against towns from Connecticut to Massachusetts. Called King Philip's War (1675) by colonists, the conflict devastated the traditional way of life for native people in New England. Though Philip successfully brought warriors from many communities together to create a large force, hundreds were sold into slavery abroad after they lost the war. Others, especially women and children, were forced into involuntary servitude. Ultimately the Wampanoag and other local native communities gradually adapted to the English way of life in order to survive.

Resistance often included religious experiences such as visions or ecstatic contact with spirits of water, earth, and sky. One of the first prophetic movements took place in the southeast, where Spanish soldiers and missionaries settled among native peoples. The Tarahumaras resisted the Spanish in 1616; numerous other religious revolts took place in the southeast between 1576 and 1656.

Elsewhere similar resistance movements emerged and flourished, shadowing British colonists as they moved westward. Often a severe depletion of game and loss of lands to colonists ignited festering resistance movements. Nativistic movements, embracing native culture and rejecting the culture of the foreign invaders, began in the northeast about 1737 and continued well into the nineteenth century. These were guided by prophets who had visions urging them to lead their people to cooperate with other Indian nations, return to native ways, conduct sacred ceremonies, and fight for their people.

In 1751 a Pennsylvania Indian agent identified prophets among the Shawnee and Onondaga Iroquois at the town of Otseningo who had visions that God had driven the game animals away to punish the Indians for their use of alcohol. The prophet urged the Indians not to trade with the English. From Otseningo the movement continued south and west from community to community. A young Delaware woman whose

name has not been recorded was one of the first prophets to mount a political challenge. One of many refugees in a Wyoming Valley town, she had a vision in which the Great Spirit told her to destroy the poison from among her people. She attributed the sickness and death of so many to a medicine bundle held by the local leadership who were bound to the Six Nations Iroquois and thus tied to the British. She rallied her people to fight the British and the Iroquois during the French and Indian War.

A few miles north, a Munsee Indian named Papoonan had a vision and began preaching a message of love and reformation. He preached that the Great Spirit was angry with the Indians for their use of alcohol and for other sins. While not promoting warfare, he did promote native ways and urged his people to resist the greed that he perceived in white culture.

In present New York State, an Assinsink prophet known as Wangomend also experienced visions and preached open hostility toward the British. He denounced the use of alcohol and re-introduced ceremonies to gain spiritual power. After the French and Indian War, he fled with his people to Ohio, where they encountered the Delaware prophet Neolin. Neolin inspired the Ottawa warrior Pontiac to lay siege to Detroit in 1763. Neolin emerged as the spiritual leader of a Pan-Indian militant movement. In 1760 he urged his followers to relinquish all the sins and vices learned from whites and reject the use of European-made goods. He believed that the Great Spirit would then provide the Delaware with the arms needed to defeat the British.

Prophetic movements often incorporated a purifying ritual as part of their ceremonies. Neolin had young men drink an herbal tea that caused them to vomit, thus purifying them of European influence. This ceremonial practice became widespread throughout Delaware country, where young men were trained in traditional techniques of warfare.

Neolin advocated armed resistance to Anglo-American expansion. His movement united the Delaware's quest with the Potowatomis, Shawnees, Wyandots, Miamis, Senecas, Ottawas, Chippewas, and others. Many other prophets also provided their people with an explanation for their misfortunes. By blaming their hardships

on cooperation with the British, Native Americans could turn to the sacred for spiritual power while uniting in opposition to the enemy.

Native Americans employed new prophecies, dances, and stories to forge alliances with other tribes, developing new religions to help transform the reality of colonial tyranny. The Delaware, Shawnee, Creek, and Sioux nations used a wide range of cultural resources, including Christian ideas about the sacred book and savior, and meshed them with traditional indigenous forms (such as purification practices and spiritual dances) in making their new religions.

Although Pontiac's War ended in 1765 without the defeat of the British, native resistance movements continued. One reason for their survival was the split among natives, with one side wishing to accommodate the British and the other side resisting. When the nativist cause faltered, they could blame accommodating Indians for having displeased the Great Spirit by rejecting native culture.

Several prophets developed a racial theory that white, red, and black people were created separately and should remain separate. Throughout Indian country, the belief in a preordained separation of Indians from whites and the quest for spiritual power persisted even in the face of military defeat. The Cherokee leader Old Tassel used this belief to defend his people's ways. Prophets who believed in a separate creation and separate road to salvation for Indians, Europeans, and Africans could reject Christianity and propose salvation through native religion. Although native religious rituals and Pan-Indianism failed to defeat colonists during this period, the idea of Indian unity continued. Northern nativists attributed their defeat to misconduct among their own people who had not defended their lands.

With the coming American Revolution some native communities sided with the British, while others sided with the settlers. Many of the New England tribes fought alongside the Americans, expecting that the expulsion of British control would liberate them as well. But in the southeast, aggrieved Shawnees, Cherokees, and Creeks joined the British in attacking American settlers, who had taken much of their land. A large Pan-Indian alliance grew during this period, part of the greater resistance movement across the

eastern woodlands (outside of New England). The Americans overpowered the Cherokees by 1776, while the Shawnees and Creeks were defeated by 1779.

For years, prophets continued to attract followers. Spiritual resistance movements continued into the nineteenth century, and numerous prophets arose. Later prophets, like the Shawnee Tecumseh, tried to unite all Indian peoples to resist assimilation. He and the Seneca prophet Handsome Lake are perhaps the best known of the many Native American resistance leaders.

European and Native American Alliances

Studies of the European colonization of North America have gained greater subtlety with the introduction in recent decades of the notion of borderlands. Built into this field is the understanding that a simple model of violent domination is inaccurate as a template to impose on all indigenous-European historical relations. While the underlying narrative of conquest is difficult to contest, the borderline between conqueror and conquered becomes hazier when it is recognized that there were many shifting alliances between Europeans and Native American groups as Europeans gained a foothold and power by aiding some tribes in their intertribal disputes

and as both parties exchanged cultural patterns and established new norms. General patterns for such cultural and political borderlands differed between the Native Americans and different European groups, including the French, the English, the Spanish, and what were to be the Americans. As European groups engaged in their own intertribal disputes and warfare, Native American confederations, with a mind to survival, rather than remaining neutral often supported one among these powers, specifically in the many French and Indian wars of the seventeenth and eighteenth centuries and later in the battles of the English against the new American government during the Revolutionary War.

While the work of Spanish Jesuit and Franciscan missionaries in the Americas evinced some awareness and sensitivity to indigenous cultural beliefs, the relations of the French to Native Americans make the strongest case for the importance of the borderland, or the so-called middle ground. In his 1991 work *The Middle Ground: Indians, Empires, and Republics in the Great Lakes Region, 1650–1815*, historian Richard White analyzed the relations of the French with Native Americans and their unique forging of a political and cultural middle ground between the peoples, with neither Europeans nor Native Americans dominating one another, as trappers (more specifically company agents known as *coureurs de bois*) took Native American wives, adapted to indigenous customs, and created an entire zone of cultural and linguistic hybridity. French Jesuits also mastered North American native languages in order to increase their success in conversions. At the same time, the authorities of New France rather than simply imposing martial control over an area took on a paternalistic role as peacekeeper, mediating tribal disputes, and so gained respect and cooperation from native peoples, as in one important case when an alliance was forged with Algonquins against Iroquois. The French-Indian alliance depended on the fact that the French goal was to establish and maintain a fur trading empire and not to colonize, repeople, or reshape the land in a European pattern.

Violence and domination also were not the only models for Puritan-Indian relations in New England. The *Mayflower* passengers who

settled at Plymouth, as depicted in *Mourt's Relation: A Journal of the Pilgrims at Plymouth* (1622), discovered a landscape that included many abandoned villages, the aftermath of the smallpox epidemics of 1617–1618 introduced earlier by traders who wiped out a huge percent of the native population. King Massosoyt, the leader (*sachem*) of the Wampanoag Confederation, sent to the Pilgrims as a representative Samoset, who spoke some English, to open negotiations. Eventually the Pilgrims made a treaty with Massosoyt and aided him in his conflicts with the Narragansetts and, in turn, were aided by Massosoyt in military affairs and basic survival skills. As a representative, Massosoyt sent to the Plymouth settlement Squanto, an early inhabitant of the middle ground. Squanto was an English-speaking Patuxet who had been kidnapped by English traders in 1614 and sold as a slave and had only recently returned to his homeland to discover his people entirely wiped out by smallpox. Although he later fell out of favor with Massosoyt because of his own maneuvering for power, Squanto, as the Thanksgiving tale indicates, introduced many indigenous agricultural and hunting-gathering techniques to the nearly starving settlers. These settlers had not, of course, journeyed to the New World with the intentions of learning from “noble savages.” In the same period, Thomas Morton, a British trader forced from the colonies for trading guns and rums for furs, lampooned the rigidity of the Puritans and valorized the Native Americans and their love of life in his literary work *New English Canaan* (1637). In ensuing decades, a different version of an English-indigenous middle ground developed as Puritan missionaries succeeded in converting Native Americans to Christianity and in setting up entire communities of so-called Praying Indians (that is, Christianized Indians).

The uneasy coexistence of English settlers and indigenous Americans lost all semblance of cooperation with the outbreak of Metacomet's (King Philip's) War (1675–1676). Metacomet, who gained position as sachem of the Wampanoag Confederation after the mysterious death of his brother Wamsutta, steered the Wampanoags and a wider confederation to war after a series of land disputes, injurious legal settlements, and clashes with Puritans. In this war

Puritans fought an all-out brutal war of domination against Narragansett, Wampanoag, Algonquin, and other tribes, under the leadership of Metacomet. During this conflict the settlers' fear and hostility toward Native Americans made the communities of Praying Indians easy targets. While some Praying Indians were protected, many fell to illness as refugees or were sold into slavery, while yet others formed militias that helped the English defeat Metacomet.

Historian Jill Lepore argues that this bloody conflict set the tone of the Indian wars of the next centuries, as settlers denied the basic humanity of indigenous peoples and Indian hating emerged as a basic creed. At the same time, this war in the English settlers' minds created a new middle ground as they began to forge an identity that was no longer entirely English yet not Indian; such anxieties over identity were also disclosed in the many captivity narratives published in those decades in which captured Euro-Americans described their experiences (sometimes favorably) living as a captive or member of a Native American group.

European Crusades against the Turks

The stunning military successes of the Ottomans against European powers beginning in the fourteenth century led to the establishment of an empire that included all of Anatolia, the Balkans, the remnants of the Byzantine Empire, and large parts of central eastern Europe. Until the sixteenth century the European response was dominated by failure, as European crusading armies experienced crushing defeats at

THE DEFEAT OF THE OTTOMANS AT THE SECOND SIEGE OF VIENNA, 1683

The second siege of Vienna came at the end of a phase of increased Ottoman aggression and resulted in a strategic loss for the Turks. Not only did the Turks fail to capture Vienna, but their attack inspired the formation of a new Christian Holy League, temporarily bringing unity to European forces, and resulted in the return of lands previously conquered by the Turks to European control. The following source deals with the defeat of the Turks at Vienna in September 1683 by Christian forces under the leadership of the Polish king Jan III Sobieski.

“The battle was fought on the twelfth, it lasted fourteen or fifteen hours; the slaughter was horrible, and the loss of the Turks inestimable, for they left upon the field of battle, besides the dead and prisoners, all their cannon, equipment, tents and infinite riches that they had been six years gathering together throughout the whole Ottoman Empire. . . . The battle ended by the infantry of the trenches, and of the Isle of the Danube, where the Turks had a battery [of artillery]. The night was spent in slaughter, and the unhappy remnant of this army saved their lives by flight, having abandoned all to the victors; even an infinite number of wagons, laden with ammunition, and some field pieces, that designed to have carried with them; and which were found next day upon the road they had taken; which makes us suspect that they’ll not be able to rally again, as neither having wherewithal to encamp themselves nor cannon to shoot with.

So soon as the Grand Vizier knew the defeat of his first lines, he caused a red tent to be pitched at the head of his main body, where he resolved to die for the Ottoman Empire, but his last efforts were to no purpose; and the wing of the Imperialists, which he attacked with all his might, was so opportunely succored by the presence of the king, who brought part of the troops of his left wing thither, that all fled before him. So soon as he [Sobieski] perceived the red tent, knowing by it that the Vizier was there in person, he caused all his artillery to fire upon that pavilion . . . [and] they brought down the red tent of the Grand Vizier; and the troop of Prince Alexander his second son, had the advantage to break through that body of cavalry, at the very place where the Vizier was, who was dismounted, and had much ado to save himself upon another horse; having left, . . . even the great standard of Muhammad, which the Sultan had put into his hands when he set out upon this expedition; and which the king [Sobieski] has sent to Rome . . . to be a testimony to the Pope, of this great victory.”

Polish Manuscripts, or The Secret History of the Reign of John Sobieski, the Ill of That Name, King of Poland, Containing a Particular Account of the Siege of Vienna, trans. François-Paulin Dalairac (London: Rhodes, Bennet, Bell, Leigh and Midwinter, 1700), 355–364.

Nicopolis in 1396, Varna in 1444, and Athens in 1456. Serbia, Bosnia, and Wallachia also came under Ottoman control by 1478, and by 1480 the Ottomans succeeded in briefly establishing a base for further military operations at Otranto in Italy, which caused fear that Rome itself could fall to a Turkish attack.

The earliest and most significant sign of a change in European fortunes came when European armies won an important battle over a much larger force of Turks at Vienna in 1529. It was the farthest advance into Europe by the Turks to date and likely would have provided a crucial base for further expansion had they not been defeated.

Perhaps equally important, the Turkish threat had forced an alliance between otherwise hostile Christian powers including Emperor Charles V and King Francis I of France, bringing into existence a general peace and unity among European powers that had long been desired by the papacy. The confidence inspired by the success at Vienna bolstered European hopes of recapturing Constantinople from the Turks. In 1536 Pope Paul III assured King Sigismund I of Poland that the retaking of Constantinople was high on his agenda, but French suspicion of the formation of a Venetian-papal alliance inspired a short-lived and unsuccessful Franco-Turkish alliance that

shattered European unity. Although the pope eventually negotiated a truce between France and the empire, by 1540 the Venetians had made a temporary peace with the Turks, effectively dashing Papal hopes of retaking Constantinople.

European-Ottoman warfare slowed in the mid-sixteenth century, but by the late 1560s Europeans realized that the Turks intended to seize Venetian Cyprus. In March 1570 the Turks demanded the surrender of Cyprus by Venice, and this brought about a new series of European-Ottoman wars in the eastern Mediterranean. None of these battles was as celebrated as the defeat of the Ottoman fleet at Lepanto in 1571. Under the auspices of the so-called Holy League, a quickly formed coalition of European forces that included the papacy, Spain, Savoy, Genoa, Venice, and the Knights of Malta defeated the Turks in a naval battle off the coast of western Greece. The battle at Lepanto was an important European victory because it devastated the Turkish fleet and temporarily, but significantly, degraded their naval capabilities in the region. The Holy League was formally disbanded after the signing of a peace treaty with the Turks in 1573.

Following the events of Lepanto and the subsequent peace treaty of 1573, conflict between Turks and Europeans again went into a period of decline that effectively lasted until the Turks successfully invaded Venetian Crete in 1645. This ignited a new series of conflicts between European and Turkish forces in eastern and central Europe. Perhaps the most notable European victory during this period happened during the second siege of Vienna in 1683. Although greatly outnumbered, the inspired leadership of Jan III Sobieski led the combined Habsburg and Polish forces to a decisive victory over the invading Ottoman army. This victory marked a turning point for European powers in their centuries-old conflict with the Turks and inspired Pope Innocent XI to call for the formation of a new Holy League in 1684. The league was initially composed of Habsburg Austria, Venice, and the Polish-Lithuanian Commonwealth, with the Russian Empire later joining in 1686. The newly formed league then engaged in a series of successful wars, ultimately forcing the Ottoman empire to surrender some of its European territories with the signing of the Treaty of Karlowitz in 1699.

➤ POPE PIUS II—COMMENTARIES

The following is taken from Pope Pius II's *Commentaries*, which provides the only autobiography ever written by a reigning pope. Pius (r. 1458–1464) wrote about himself in the third person, and in the following selection he details one of his many efforts to inspire enthusiasm in Europe for a crusading effort against the Turks.

“He [Pius II] then invited various bishops, abbots, notaries, royal ambassadors and all the officials of the Curia to a meeting in the palace chapel so that their advice too, could be heard. There he made public the project he had long held in his heart. He described the great disasters the Turks had inflicted on Christendom and explained how they were scheming to overthrow the Gospel law. The fall of a Christian nation was for him the bitterest blow imaginable; he was charged with the care of their sacred religion; he had decided to take the offensive against the Turks. Since this could not be done without help from the princes of Christendom, he was determined to hold a congress either at Udine or Mantua to hear the opinions of those whose aid he meant to enlist. It would be hard for him to leave Rome, the seat of St. Peter the Apostle and the ark of the Christian faith, but would be harder still to see the holy gospel destroyed in the course of his reign. To save it, he was resolved to stake not just the city and the patrimony of Peter, but his own health, indeed his very life. And so, though he was old and infirm, he proposed to cross the Apennines and the Po and confer with Christian princes about the rescue of the Christian faith.”

Pope Pius II, *Commentaries*, Vol. 1, edited by Margaret Meserve and Marcello Simonetta (Cambridge, MA: Harvard University Press, 2003), 215–217.

In the wake of the Treaty of Karlowitz, the Russian tsar Peter the Great (sole ruler during 1696–1725) continued crusading efforts against the Ottomans. Since 1698 Peter had been sending observers to learn of the training and abilities of the Knights of Malta and inquire on

the possibility of future joint ventures with the knights against the Turks. Peter's efforts ultimately ended in failure when he attacked the Ottomans in an unsuccessful crusade. Following the unexpected Ottoman victory, Peter was forced to return the Ottoman lands he had originally won from the Turks at the end of the seventeenth century in the Peace of Pruth in 1711. Sporadic warfare between Russia and the declining Ottoman empire continued until well into the nineteenth century with limited success for Russia.

Although some scholars have attributed the end of crusading in Europe to the fall of the last crusader state of Malta in 1798 (not to the Turks but to the forces of Napoleon), the distinction of crusading as a holy war in defense of the faith, as opposed to warfare for nationalist reasons, had begun to fade from the European consciousness centuries earlier. European monarchs had long been making treaties and alliances with Muslim powers against other Christian states to preserve their national interests rather than abiding by religious loyalties. Concurrently, and perhaps more significantly, the authority and influence of the papacy in European affairs steadily declined, with national governments filling the void and abandoning religious motivations in favor of national interests when making war.

The Changing Face of the European Crusade—Protestants and Pagans

The crusading movement against European pagans, collectively known as the Northern or Baltic Crusades, began with Pope Eugene III's papal authorization of a holy war against the "heathen"

of northern Europe in 1147 and ended at the Russian frontier in the early sixteenth century. While not nearly as well known as their more famous counterparts to the Holy Land, the pagan crusades were far more successful, resulting in the long-term spread of Christianity and western European social and governmental ideals in north-central Europe.

Although crusades against pagans began in the middle of the twelfth century, the movement intensified as crusading efforts in the Holy Land ended in the thirteenth century, which made available considerable additional manpower and resources, most notably the efforts of the Teutonic Knights, against pagans. While the crusaders, primarily based in Prussia (northeastern Germany), significantly contributed to the ultimate conversion of northern European pagans during the thirteenth and fourteenth centuries, they also created long-lasting hostilities that were not quelled by the spread of Christianity. For example, while the vast majority of Lithuanians had converted to Christianity by the end of the fourteenth century, they eventually formed a military alliance with Catholic Poland that had greatly reduced, but did not cripple, the power of the Teutonic Knights during the early fifteenth century.

The decline of the Teutonic Knights, historically the most dominant crusading order of the area, from the mid-fifteenth to sixteenth centuries was central to the end of crusading efforts against pagans in Europe. Their Catholic opponents in Poland and Lithuania protested the Knights' continued threat to Christians in the region as well as their continued dominance of parts of Prussia, challenged the legitimacy of the Knights' mission, and inspired increasing criticism by many ecclesiastical leaders in Europe. Although the Knights continued to engage in sporadic warfare with their Christian neighbors as well as a few pagans, their efforts were ineffectual. The effective end of the Knights as a crusading force in the north came in 1525, when their grand master, Albert of Brandenburg, renounced his vows and converted to Lutheranism to become Duke of Prussia, although some Knights continued to have influence in Livonia until the mid-sixteenth century.

Later crusades were also launched against alleged heretics. A successful precedent had been

► THE DESTRUCTION OF MAGDEBURG, MAY 1631

The following is from Otto von Guericke, burgo-master of Magdeburg, who recorded the destruction of his Protestant-controlled city in May 1631 by the combined forces of Ferdinand II and the Catholic League. Otto cites the Catholics' "common hatred of the adherents of the Augsburg Confession" (the primary confession of faith of the Lutheran Church) as at least partly responsible for the brutality of the victorious Catholic forces during which nearly 20,000 were slain and most of the city was destroyed.

"Thus it came about that the city [Magdeburg] and all its inhabitants fell into the hands of the enemy, whose violence and cruelty were due in part to their common hatred of the adherents of the Augsburg Confession. . . . Then was there naught but beating and burning, plundering, torture, and murder. Most especially was every one of the enemy bent on securing much booty. When a marauding party entered a house, if its master had anything to give he might thereby purchase respite and protection for himself and his family till the next man, who also wanted something, should

come along. It was only when everything had been brought forth and there was nothing left to give that the real trouble commenced. Then, what with blows and threats of shooting, stabbing, and hanging, the poor people were so terrified that if they had had anything left they would have brought it forth if it had been buried in the earth or hidden away in a thousand castles. In this frenzied rage, the great and splendid city that had stood like a fair princess in the land was now, in its hour of direst need and unutterable distress and woe, given over to the flames, and thousands of innocent men, women, and children, in the midst of a horrible din of heartrending shrieks and cries, were tortured and put to death in so cruel and shameful a manner that no words would suffice to describe, nor no tears to bewail it."

established during the early-thirteenth-century crusade against the Albigensians, located primarily in the south of France. Military campaigns launched by the papacy against political opponents during the thirteenth and fourteenth centuries (the so-called Political or Italian Crusades) were also justified through accusations of heresy. Among the most notable later crusades against heretics were the five unsuccessful expeditions launched against the Bohemian Hussites (often cited as forerunners to the Protestant Reformers) in the early fifteenth century.

Crusading efforts against heretics paved the way for crusading against Protestant Christians, who were initially considered heretics by the Catholic Church hierarchy. Although the Protestant Reformation came at a time when the papacy was dealing with the Turkish threat to Christian nations in eastern and central Europe, the Church hierarchy quickly took notice of the Protestant movement, and many considered it as dangerous a threat to Latin Christendom as the

Turks. In 1526 a proposal for a "general crusade" was incorporated into the Treaty of Madrid, which in part called for the "extirpation of the errors of the Lutheran sect." In 1551 Pope Julius III threatened a crusade against King Henry II of France for his aid to Protestants, and by 1566 King Philip II of Spain's spokesman declared that Protestants were more of a threat to Europe than the Turks. Aspects of the early stages of the Thirty Years' War (1618–1648), which began as a religious war before its evolution into more of a dynastic struggle, clearly drew at least some of its inspiration from the image and language of crusading.

Many early Protestants, Martin Luther in particular, showed little aversion to religious wars that resembled crusading. In fact, early Lutheran princes supported Catholic efforts to fight the Turks, and Protestant England formally initiated a six-week period of thanksgiving after the successful defense of Malta in 1565. Some Protestants even served with the Hospitallers on Malta

to provide for its later protection against the Turks. In the late sixteenth century, Huguenot Francis of La Noue theorized on a joint crusading effort of Catholics and Protestants for the liberation of Constantinople from the Turks. Yet as Protestantism matured, the Catholic nature and imagery of crusading lost its appeal, and future Protestant wars were not framed in the context of a crusade.

Bacon's Rebellion

Bacon's Rebellion was an upheaval in the Chesapeake region in 1675–1676. Class distinction and struggle permeated life during the Colonial period. Occurring 100 years before the Declaration of Independence, this event is described as the “first American Revolution” and is a case study in class struggle: years of distrust and animosity between Virginia elites and freemen erupted into violence and lawlessness.

At the center of the rebellion was the effort by wealthy elites to keep the colony's best lands and privileges out of the hands of the freemen. The freemen, formerly indentured servants, had

worked a specified amount of time for the cost of travel to the colonies. Once released from servitude, the freemen sought land and a new start. Virginia elites felt threatened by the large numbers of freemen and feared grievances would spill over to servants and slaves and lead to open rebellion. The fear was somewhat unwarranted, however, as Native American relations on the frontier actually provided the main cause for the revolution. White settlers pushed into the western back country because most of the best coastal lands were in the hands of elites. Left unprotected by inadequate militia, these settlers, many of them freemen and their families, suffered raids by hostile indigenous groups living in the same remote regions.

Declining tobacco prices due to England's war with the Dutch had forced many planters to seek favorable trade with friendly Native Americans, and officials were reluctant to upset relations because of isolated incidents on the frontier. Along the James River a group of freemen of humble means, led by disgruntled wealthy planter Nathaniel Bacon, Jr., took reprisal by carrying out a campaign that made little distinction between friendly and hostile indigenous groups. Invited to Jamestown by Governor William Berkeley, Bacon demanded a militia commission. Berkeley, fearing Bacon more than hostile Native Americans, accused the freemen of treason and declared their leader a traitor.

Bacon was arrested but later released. Bacon persisted in his quest for power, eventually winning a seat in the colonial legislature. Berkeley failed to prevent Bacon from taking his seat, and, faced with violence, he fled Virginia. With Berkeley gone, Bacon increased his forces and plundered the estates of pro-Berkeley elites. The class struggle escalated as Berkeley offered freedom to servants who joined his militia, while Bacon offered freedom to slaves and servants of Berkeley supporters. Troops from England were on the way to suppress the rebellion as Bacon descended into random plunder and theft. Bacon became ill—most sources credit dysentery—and died on October 26, 1676, leaving his men without a leader. The British troops arrived and arrested all but eighty of Bacon's followers in November.

On his return to Virginia, Berkeley carried out the hanging of about 24 wealthy men who

Scene from Bacon's Rebellion. (Library of Congress)

had supported Bacon. Their estates were taken to compensate pro-Berkeley victims who were plundered by Bacon's forces. King Charles II of England was displeased with Berkeley's response and called him back to England, where he died in 1677.

Subsequent legislation loosened Virginia's social system for whites, but made it even more difficult for slaves. Some scholars feel that slavery took a decidedly more cruel turn in the wake of Bacon's Rebellion, with officials there determined to draw rigid color lines to preclude future alliances among poor whites, indentureds, and slaves.

Today, Nathaniel Bacon Jr. is viewed by some as a champion of liberty who fought a cruel tyrant, hence a precursor of the American Revolution. Some scholars think this assessment too charitable and that Bacon was a selfish, power-hungry criminal.

The Fronde in France

The Fronde (1648-1653) was a civil war in France and was part of the larger movement in the seventeenth century by the European nobility to resist the encroachment of absolutist monarchs as they attempted to centralize their power. One of the main issues under contention was the right of the king to tax the nobles. The Thirty Years' War (1618-1648) and the Franco-Spanish War (1635-1659) caused stress on the royal treasury, and policies instituted by Cardinal Richelieu and his successor Cardinal Mazarin in turn led to heavy taxes on the nobles in violation of their feudal privileges. The

peasants also objected to the new taxes, and riots erupted at the end of the 1630s. In 1648 Mazarin was determined to raise taxes even higher in an attempt to gain a military victory for France once and for all. However, in order to raise taxes, the Parlement, France's judicial system, needed to approve them. Mazarin was hoping that since the *paulette*, the tax that gave the judges the rights to their offices, was due to be renewed that same year, he would be able to use that to pressure the judges into approving the tax. To add to the pressure, the nine-year-old Louis XIV was brought to the Parlement chambers on January 15 by his mother and regent, Anne of Austria and Mazarin, for a *lit de justice*. A lit de justice, or literally bed of justice, was a ceremony in which the king presented himself to the Parlement in order to pressure them into accepting a certain law or tax. However, rather than being pressured, the members of Parlement remonstrated against the tax.

News of the Prince of Condé's victory against the Spanish at the Battle of Lens in August gave Mazarin enough confidence to have the leaders of the Parlement arrested. This move proved to be a mistake, as the citizenry of Paris suddenly began to riot and barricaded the streets. The citizens used slings, or *frondes*, to throw stones into the windows of royal governors, thus giving the movement its name. The nobles also revolted, demanding that an Estates-General be called, as they knew that they would be able to vote down the tax in that forum. With the prince's army away, the royal family felt that it had no choice but to flee Paris. However, the Peace of Westphalia was signed shortly afterward, and Condé's army had Paris under siege by January. Not being able to combat the royalist forces, the nobles suggested asking for Spanish aid, a suggestion that was flatly refused by the citizenry. The fighting ended with the Peace of Ruell in March 1649; however, this truce did not end the Fronde itself but instead only ended what is known as the parliamentary phase.

Throughout 1649 several provinces continued to revolt, and this time Condé supported the revolutionaries against Mazarin. Condé was then arrested in January 1650. This move caused Condé's supporters to fight against the cardinal, which resulted in him leaving the country.

THE DUCHESS DE LONGUEVILLE

Many women, most especially Anne Geneviève de Bourbon, the Duchess de Longueville (1619–1679), were involved in the Fronde. As a princess of the blood and the wife of the governor of Normandy, she was instrumental in bringing her brothers Condé and Conti into the movement. More than just a supporter, the duchess held an active role in the planning of the first Fronde. She held war councils in her chambers at the Hôtel de Ville, recruited the troops, found the funding to pay them, and helped organize the defense. It is said that no military decisions were made without her approval. During the second Fronde, both her brothers and her husband were imprisoned for over a year. In the meantime she took leadership of the resistance in Normandy and even managed to negotiate a treaty with Spain from a Belgian border

town. This action would later earn a charge of high treason from the Crown, but once her relatives were released from prison, she spent the final months of the civil war protecting the Ormeé movement, even though by this time her estranged husband had already rejoined Mazarin's side. In 1650 she coauthored a pamphlet entitled *Apologie Pour Messieurs les Princes* in which she wrote that she must defend "the liberty to speak, as it is the only thing that remains to me." After the conclusion of the Fronde, her charge of treason was pardoned by Louis XIV, and she accompanied her husband to Rouen. As she was in disgrace at court, she devoted the rest of her life to religion and became a powerful patroness of the Jansenist movement in France.

—Monique Vallance

Condé was released and allowed to serve on the royal council. Fighting continued through 1651, and that same year Louis XIV ended his minority and took control as king. Condé did not appreciate his reduction in power, but he was forced to submit when he was defeated by royalist forces. Finally the Ormeé movement in Bordeaux sprang up, causing the nobles to stall their efforts. This movement started a revolutionary government in Bordeaux that claimed the right to govern themselves, outside the authority of the king. This movement threatened the power not only of the king but also of the nobles, and this caused the nobles to stop their rebellion against the king and helped restore royal authority. The second stage of the Fronde, the Fronde of the princes, was over by 1652, and Mazarin returned to France, where he served as Louis XIV's minister until Mazarin's death in 1661. Louis never forgot the betrayal of his nobles, and this would influence the later policies of his reign to increase his absolute authority. Therefore, the Fronde helped to increase rather than decrease absolute authority in France.

"Time of Troubles" in Russia, 1598–1613

The so-called Time of Troubles in Russian history, more broadly dated at 1584–1618, refers to a chaotic period of social and political upheaval when the throne was left without an heir following the death of Fedor I (1584–1598), the only surviving son of Ivan IV (1547–1584), also known as "Ivan the Terrible." The cause for the Time of Troubles can, in one sense, be traced back to the death in 1581 of Ivan Ivanovich, the oldest of Ivan IV's three sons and the one being groomed to rule. Many believe that Ivan IV himself was responsible for his son's death, allegedly striking him with his staff in a fit of rage, though such an interpretation remains debated. Regardless, Ivan IV's second son, Fedor I, thus took over in

1584 upon his father's death and held the title of tsar until his own passing in 1598. But he proved incapable of the task at hand, and his brother-in-law, Boris Godunov, who was descended from lower-ranking boyar nobility and who had long served in the royal court, became the de facto ruler of the empire, eventually being elected tsar upon Fedor's death (r. 1598–1605). Godunov ruled in lieu of Russia being left with no legitimate heir to the throne, since Ivan's third son, Dmitry, had passed on before Fedor in 1591.

The Time of Troubles is thus dated to the inevitable crisis of leadership that became reality after Fedor departed, though its shadow was already cast when Ivan died, and it was not brought to its most acute point of tension until the sudden death of Godunov eight years after Fedor's time. But its underlying causes go back even further to the latter part of Ivan IV's reign, not only to the death of all three of his sons, particularly his firstborn in 1581, but also to the broader social chaos engulfing Ivan's tragic personal and dynastic history. Indeed, it was in many ways the harsh manner in which Ivan IV ruled in the period following the death of his beloved first wife, Anastasia, in 1560 that earned him the nickname Ivan the Terrible (although *grozny* in Russian means "formidable" or "awesome," not "horrific"). Whatever the cause, it was particularly reflected in his policy of Oprichnina administered by black-clothed secret police riding about the country on black horses and inflicting punishment at will upon the masses, a policy said to have arisen out of Ivan IV's paranoia over suspected conspiracy plots among the boyar, whom he believed had poisoned Anastasia. Those fears spilled over into the struggle between Ivan and the boyars for influence and control of Russian society and thus the policy of Oprichnina, dividing Russian domains between Ivan and the boyars and employing his secret police.

During this period elite landholders suffered grave losses, often expelled from their estates in the middle of the severe Russian winter and left stripped of their political influence and hereditary privileges. The resulting increase in taxation and significantly curtailed freedoms of the peasants instigated a mass exodus to the outskirts of Russian territory, away from the central

➤ "THE CULT OF IVAN THE TERRIBLE IN STALIN'S RUSSIA"

The sidebar title here is borrowed from a book written by Maureen Perrie. It reflects the fact that Josef Stalin looked to Ivan the Terrible and his Oprichnina of the sixteenth century as a model and inspiration for his mid-twentieth-century rule (1928–1953). Stalin is, of course, the notorious Soviet leader who, through his employment of the KGB, that is, the Soviet Secret Police and other means, bears responsibility for nearly three times more deaths than Adolf Hitler. Stalin was quoted as praising Ivan as "a great and wise ruler" who "wasted too much of his time repenting of his sins and praying for the souls of his victims," the latter sentiment reflecting the ironic fact that Ivan, in contrast to the unapologetic atheism of Stalin, had counted himself rather religious, engaging in confession and prayer.

Stalin's reverence for the first tsar of Russia led him to make a film about him entitled *Ivan Grozny*, the latter being the Russian term controversially translated as "terrible" in English, while some, like Stalin, suggested that "great" or "awesome" was a better rendering. A detailed transcript of Stalin's interview with the director of that movie in 1947 was published in 1988 when Mikhail Gorbachev revisited the whole question of Stalin's fascination with Ivan during glasnost. Gorbachev was the second Russian leader to dig up the Stalin-Ivan connection in a second wave of de-Stalinization, the first having been undertaken by the first Soviet leader to follow Stalin, Nikita Khrushchev (1953–1964), beginning with his condemnation of Stalin's destructive actions in 1956. Soviet historical representations of Ivan had been overall negative. Stalin sought to reform Soviet understanding of Russia's first tsar in order to help legitimate his own rule, with the result seeming to be a generally negative view of both in the post-Stalin era.

—R. Charles Weller

lands where most of the oppression was taking place, creating a labor shortage on many estates. Only the northern regions remained stable.

Godunov managed to bring a measure of restoration after Ivan's reign of terror with superior organizing abilities leading to greater social satisfaction and increased foreign trade. But the

damage had gone too deep, and Godunov himself finally resorted, in desperation, to heavy-handed policies that, combined with Fedor's death and a severe famine between 1601 and 1603, undermined his rule. Even before Godunov's sudden death in 1605, rumors had begun to surface that Ivan's third son, Dmitry, was still alive, having allegedly fled and taken refuge in Poland. Whether this originated as a popular rumor or one that was intentionally spread out of political motivation is not clear. It nonetheless came to be employed in a Polish religio-political cause, namely the takeover of Russia and, with it, its conversion to Catholicism.

This alleged Dmitry thus invaded Russia with a joint Polish and Ukrainian army. Russian peasants who had fled the central lands, discontented as they were with leadership in Moscow, joined ranks. Though at first turned back, Dmitry's army, with the further aid of Cossacks, proved successful, and Dmitry I was crowned tsar of Russia, ruling for more than a year (1605–1606). Filling the Russian court with Polish supporters, opposing Russian Orthodoxy, and parading Catholicism hardly won him any support among the more conservative Russian constituency. His reign was cut short in a popular uprising that brought Prince Vasili Shuiskii to the throne as Vasili IV, an act that itself provoked a counter-uprising, leading to civil war with the hereditary matter following from Fedor's death nearly lost in the haze. Amid the chaos, a second Dmitry from Poland invaded and usurped the throne once more. In spite of resistance efforts by Vasili who had appealed to Sweden for aid, Polish military rule was established in Moscow amid severe contestation, casting, as of 1610, a dark shadow over the entire country and its future.

In the face of Russia's permanent demise, the Russian Orthodox patriarch Germogen, held captive in the Kremlin, sounded a call across the country for national defense and liberation. The faithful among the Russian masses responded, and a bloody two-year struggle ensued that resulted in the reclaiming of Moscow. Following a period of debate over potential candidates, a new tsar of royal heritage was elected, Mikhail Romanov (1613–1645), who had ties to Ivan IV through his great-aunt, Ivan's beloved first wife Anastasia. And thus began 300 years of Romanov

dynastic rule in tsarist Russia, down to the Bolshevik Revolution and the communist takeover under Lenin in 1917. Romanov ascendancy also began a new chapter in Russian history, one that would face not only ongoing threats of foreign domination from Poland and Sweden and recurring wars with them but also leftover social, political, and economic challenges from the previous era, a partial solution for which was to be found in two centuries of enslavement of the peasantry, namely serfdom. Other new threats of foreign invasion were also to arise, only this time in the form of Westernization and its long forthcoming struggle with various aspects of Russian tradition, a struggle brought to its climax under the most famous of the Romanov rulers, Peter I, known also as Peter the Great.

Civil War in the Inca Empire

In or around 1438 CE, the Incas emerged in the southern highlands of Peru as supreme among various warring kingdoms in that region. The Incas rapidly expanded their empire to encompass parts of present-day Colombia, Ecuador, Peru, Bolivia, Chile, and Argentina. Yet in large part due to this rapid expansion, the Inca empire was characterized by frequent revolts, especially by groups on the farthest reaches of its empire. Another source of instability for the Inca empire was the internal politics of the Inca caste itself. Constant plots, intrigues, and internal revolts plagued the Capac Incas (royal Incas who traced their ancestry to the founding ancestor Manco Capac). This was largely engendered by the ancient tension between Hanan Cuzco (the lower moiety of the first five kings) and Hurin Cuzco (the upper moiety of the sixth and subsequent

kings) and by the poorly defined rules of succession to the state's highest office.

Although the Capac Incas were essentially one extended kindred, there were numerous factions among them organized along the lines of the *ayllus* (extended kin groups) and *panacas* (an entourage of descendants of an emperor responsible for celebrating his memory after his passing) of Cuzco. Each of these groups was self-sustaining in terms of wealth and had members occupying important and powerful posts in the government and army. Although the Sapa Inca, the emperor, had absolute power in theory, he was in reality dependent upon support from a majority of these factions.

The greatest cause of infighting was the confused system of succession to the imperial Crown. Unlike the European tradition of passing the crown to the oldest son of the reigning monarch, in Inca tradition the crown passed to the male of the royal bloodline who was judged by his peers to be the most able leader. The new ruler was in effect elected by his fellow Capac Incas. Because of the policy of the Incas that allowed them to take multiple wives, there was a numerous supply of men at any one time who were eligible by blood to ascend to the throne. A serious problem was that there were no clear legally encoded criteria for judging ability, and election to the highest office depended as much on political intrigues among the various Inca factions as on any other factor.

Numerous disputes arose over election results, with some even leading to revolts and coups. Civil wars over the succession, such as that between Huascar and Atahualpa just before the Spanish Conquest, were a frequent feature of the succession struggles. Emperors Capac Yupanki and Yahuar Huacac seem to have been assassinated while in office. Rulers Tarco Huaman and Inca Urcon were overthrown by their successors and written out of official Inca history. In an effort to prevent strife over the succession, some emperors appointed their heirs while still alive. These designated heirs were in some cases given coregency, the most notable being Topa Inca serving with his father, Pachacuti. This served as on-the-job training and allowed them to build up their own factions before the time came to ascend the throne. These efforts were not always

successful, however. Designated heirs such as Quispe Yupanki, the son of Capac Yupanki, and Pahuac Gualpa, the heir of Yahuar Huacac, were both assassinated by opposing factions.

Japanese Invasion of Korea

The Warring States period, or Sengoku, was a period of disunity in Japan that lasted from the mid-fifteenth century to the early seventeenth century in which the daimyo, or noble class, were at conflict with each other. One of the important people who contributed to the eventual unification of Japan under the Tokugawa was Toyotomi Hideyoshi (1536–1598), who conquered most of Japan and rose to the title of *kampaku* (imperial regent). Although he was never able to achieve the title of shogun, Hideyoshi was still able to attain a tremendous amount of power in Japan.

Hideyoshi had solidified his position in Japan by 1591, and one year later he would turn his sights on the rest of Asia. Sources suggest that Hideyoshi's plans for attacking Ming China were probably inherited from his former daimyo Odu Nobunaga, the first to begin the unification of Japan and the springboard by which Hideyoshi was able to continue the unification. This plan to attack China also hinted at a grander plan of eventually invading all of Asia. The key to attacking China would be to go through Korea, as that country was a good springboard for sending troops. The timing for this invasion is a bit strange, as Japan had only been at peace for a short time. Historians have also suggested that Hideyoshi had an ulterior motive: that by mounting a former invasion, he was ridding himself of troublesome daimyos and therefore securing his position even more. Of course, Hideyoshi could

➤ NOSES AS TROPHIES

Historians have been unable to determine the exact amount of deaths that occurred as a result of the Japanese invasion of Korea. However, some indication of the number was left by the Japanese themselves in the form of decapitated heads. The decapitating of heads as trophies of a kill in battle was a samurai tradition and was normally considered the only method by which a samurai could prove that he had killed a certain man. Toyotomi Hideyoshi was determined that his samurais would account for their kills in Korea in the same manner; however, the sending of heads from Korea to Japan proved to be a very impractical task. After the province of Namwon was captured in 1597, only the head of the Korean general was sent to Hideyoshi, while the noses of the other 3,726 casualties were sent instead of the heads. This began the custom of sending noses during the second phase of the war. The noses were sent to Japan packed in wooden barrels and pickled with salt. However, the noses were not carelessly thrown into the barrels; they and the names of their former owners were all recorded before being packed away. Unfortunately, not all of the records remain, so estimating the death toll can be tricky. Based on the fact that some commanders sent as many as 30,000 noses, historians have estimated that between 100,000 and 200,000 Koreans were killed during the second invasion alone. Today the noses remain buried near Toyotomi Hideyoshi's Great Buddha in Kyoto at a place called Mimizuka ("Ear Mound").

—*Monique Vallance*

have also been dreaming of seeing himself as the master of Asia despite the fact that he was already in his fifties and already had decreasing eyesight and appetite.

Between 1587 and 1590, Hideyoshi attempted to recommence diplomatic relations with Korea, which had been halted since 1555. However, the attempts were a failure and ended with a demand by Hideyoshi that Korea join Japan in its war against China by allowing Japanese soldiers to cross through Korea. The Koreans, ruled by King Seonjo, felt as though they were in a very difficult position. On the one hand they were allies with the Ming dynasty, and allowing the

Japanese to cross through Korea would not only signify a breaking of this treaty but would also cause the Chinese to send troops to fight the Japanese in Korea, which could spell disaster for their country. On the other hand, a refusal of Hideyoshi's demands would most certainly bring an invasion. The Japanese requests were refused twice, and Hideyoshi finally invaded Korea in 1592 despite some opposition from within Japan's government.

The Japanese landed in Korea on May 23, 1592, expecting surrender by the Koreans. To their surprise, the Koreans refused to surrender and instead chose to fight. The Japanese gained easy victories in the beginning, and very shortly they had conquered almost the entire country. However, their victories were short-lived, as many Koreans refused to submit to the Japanese rule, and rebellions began erupting all over the country. In addition, the Chinese army landed in June 1592, surprising the Japanese, who had expected the Chinese at a later date. Even though the Chinese did not gain any major victories, the combination of their arrival with the native rebellions caused the Japanese enough trouble that they were driven down to Seoul and isolated there. Hideyoshi's army remained in Seoul until 1597 as diplomats attempted to negotiate a truce with the Chinese, while Hideyoshi awaited word in Japan. All attempts at peace ended in failure, and Hideyoshi decided that there was no recourse left to him except to continue the war.

As before, the Japanese troops enjoyed some initial victories as hostilities were resumed in 1597. However, the army was thrown into turmoil when Hideyoshi died in August 1598. The death of their leader caused such confusion among the Japanese troops that the Chinese were able to push their advantage on land and the Koreans were able to push their advantage at sea to drive the Japanese out of Korea once and for all by December 1598. With Hideyoshi's death died all dreams of conquering China and Asia. Hideyoshi's successor, Tokugawa Ieyasu, not only made sure that the war with Korea was ended but also attempted to make amends with the Koreans by admitting guilt and sending back thousands of Koreans who had been enslaved in Japan. By 1624, Korean emissaries were sent to the coronation of Tokugawa Iemitsu, a sign that

relations had been repaired. As for China, some historians point to this war as one of the downfalls of the Ming dynasty, as their campaign in Korea made it more difficult for them to fight the Manchus, who eventually conquered China in 1644. However, the problems of the Ming were more deeply rooted and had already been going on long before the Japanese invasion of Korea. While the war did place a strain on the Ming army, this was not the single contribution to the downfall of the Ming.

German Peasants' War

From 1524 to 1526 a series of peasants' rebellions, commonly referred to as the Peasants' War, shook the Holy Roman Empire. Historians still debate the nature of these revolts and their causes. Some argue that they grew out of the emerging religious controversy centered on Martin Luther and his challenge to the Roman Catholic Church. Others believe that peasant revolts were prompted by greater coercion that accompanied the emergence of a more centralized state. The name itself—Peasants' War—conceals the conflict's strong urban and religious character under a mask of provincial turmoil, and some scholars even suggested describing it as "an early bourgeois revolution" or "the Revolution of 1525."

A combination of the underlying political, legal, social, and economic tensions was at the heart of the Peasants' War. In the early sixteenth century, population growth caused wages to fall and unemployment to increase in the countryside. At the same time, the consolidation of territorial states led to legal and administrative reforms that marginalized local autonomy. The aristocratic and ecclesiastical lords imposed higher taxes, tried to gain control over village commons, and reinforced serfdom.

These conditions prompted many small-scale revolts that were common before 1520, while poor harvests in the early 1520s contributed to the greater likelihood of wider protests. Discord over lordship represented the most serious source of conflict, but tensions also ran high over taxes and other burdens as early modern states began to expand and centralize. Long-simmering conflicts between townsfolk and local leaders (be it lords or bishops) only added to the general anxiety. In the early sixteenth century the existing anticlericalism was reinforced by popular interpretations of Luther's writings that demanded a reform of the Church, which seemed to be preoccupied with its own political and economical power.

No other peasant rebellion in Europe's history advanced political programs as original as those of the Peasants' War. The best known of these programs was the Twelve Articles of the Peasants of Swabia, which expressed the main grievances of peasant rebels and revealed how far Protestant ideas penetrated into the German peasantry. Luther's idea of the priesthood of all believers implied freedom and equality in both spiritual and secular worlds and was used to sanction a challenge to one of the most important institutions of feudalism: serfdom. The Twelve Articles thus opened with a demand for every congregation to have the right to choose its own pastor to preach the Scriptures purely and clearly "without any human addition, doctrine or commandment." At the same time, Article 3 proclaimed that "It is the custom hitherto for men to hold us as their own property. And this is pitiable, seeing that Christ has redeemed and bought us all with the precious shedding of His blood, the lowly as well as the great, excepting no one. Therefore, it agrees with Scripture that we be free, and we will be so." The remaining provisions of the Twelve Articles used Luther's criticism of the Church to challenge tithes, various labor services, and restrictions on use of common lands, rivers, and woods. Indeed, Luther's condemnation of monasticism was used to sanction the peasant attacks on their monastic landlords. In 1523 the monastery of Weingarten complained that "the peasants, actually drunken with the gospel," came in from all the villages to plunder its properties.

Yet neither German princes nor the Holy Roman emperor paid attention to the peasants' grievances, prompting open hostilities in 1525. The war began as a revolt against the Countess of Lupfen in Stühlingen, south of the Black Forest. The disturbance spread quickly, and within a few months the rebellion sprawled across southern and central Germany; parts of modern France, Switzerland, and Austria; and northern Italy.

At its height in the spring and summer of 1525 the conflict involved hundreds of thousands of peasant rebels, becoming Europe's largest and most widespread popular uprising prior to the French Revolution in the late eighteenth century. The peasants formed Christian Assemblies, armylike regional groups, but never a unified front. The participation of many small towns, with their petite bourgeoisie, further complicated the politics of rebellion. In southwestern Germany the peasants rallied around Hans Müller von Bulgenbach and Gottfried "Götz" von Berlichingen, while Thomas Müntzer, a radical rival of Luther, led the struggle in central Germany. Numerous groups of rebellious peasants and townspeople, some of them led by lay preachers, sought to redress their grievances through direct talks with their lords or violent protests. The peasants in Thurgau allowed their beards to grow, swearing to never shave again until they were free men. At Kempten the peasants rose against their lord, the abbot; took him prisoner; and only liberated him at the price of a heavy ransom. The example was quickly followed by the peasantry in the neighboring regions, spreading along the northern shores of Lake Constance.

To suppress the peasant rioting, the Swabian League, an association of imperial states established in 1488, mobilized its forces under Georg Truchsess von Waldburg, a devout Catholic, who conducted the campaign with determination and skill as well as ruthlessness. After negotiating a peaceful end to the rebellion in Upper Swabia at Weingarten, Truchsess von Waldburg marched north to confront rebel armies in Württemberg and Franconia, reconquering the cities that they had occupied and beheading their leaders. In April 1525 the Swabian League scored major victories at Leipheim and Wurzach. A month later its victory at Boblingen put an end to peasant revolts in Württemberg (southwestern Germany),

while the Duke of Lorraine routed peasants at Zabern, massacring hundreds. By June the devastating defeats of peasant armies at Konigshofen, Frankenhausen, and Würzburg crushed the rebellion for good. Nevertheless, punitive reprisals by lords and princes lasted until 1527.

While Luther embodied for the peasants the promise of a new and more just society, Luther himself was terrified by the peasant upheaval and played one of the most vocal roles in the princely suppression of the uprising. Initially Luther adopted a neutral stance, admonishing both the rulers and the peasants that there was nothing Christian in their violence. "For both of you are wrong," he proclaimed, "and both of you want to avenge and defend yourselves, both of you will destroy yourselves and God will use one rascal to flog another." The rulers were tyrants and the peasants were rebels, Luther argued, and both stood condemned in the Scriptures. While admitting that many of the peasants' demands were just, Luther argued that this did not justify violence. But as the reports of peasants' "horrible raging undertaken against both divine and human law" reached him, Luther's sympathies had shifted toward the authorities. In his *Admonition to Peace: A Reply to the Twelve Articles of the Peasants in Swabia* (April 1525), he denounced the peasants' demands and argued in favor of retaining serfdom. "Did not Abraham and other patriarchs and prophets have slaves?" he chastised the peasants. "Therefore this article [demand for abolition of serfdom] is dead against the Gospel. . . . This article would make all men equal, and turn the spiritual kingdom of Christ into a worldly external kingdom." In May 1525 Luther published his new book, *Against the Robbing and Murdering Horses of Peasants*, that urged the German aristocracy to use any means to smite and destroy their rebellious subjects and reminded them that "nothing can be more poisonous, hurtful, or devilish than a peasant rebel." The rulers could act in good conscience because they had a just cause, Luther expounded. "Anyone who is killed fighting on the side of the rulers may be a true martyr in the eyes of God. . . . Anyone who perishes on the peasants' side is an eternal firebrand of hell, for he bears the sword against God's Word and is disobedient to Him, and is a member of the devil."

► WOMEN AND THE PEASANTS' WAR

Contemporaries blamed the start of the Peasants' War on a woman. The Countess of Lupfen allegedly ordered peasants who were busy with the harvest to search for snail shells upon which she wished to wrap newly spun yarn. The countess not only took the service required of peasants for their right to use land to irrational extremes but also attempted to make peasants do the work of handmaids, integrating "male" work into the "female" sphere of the household. This anecdote conformed to popular misogynist ideas. Female disrespect and foolishness were the final straws that provoked a violent reaction by the peasants.

The peasant rebels were often absent from their respective villages for weeks or even months, leaving their farms in the care of their wives. In addition to this passive support, on some occasions women actively took part in the insurgence. Women spread news about the revolt and asked men to join the rebellion. The peasants employed female messengers. The rebels attacked and destroyed castles and monasteries. They were accompanied by peasant women who took the opportunity to pilfer. After robbing convents, rebels threatened the nuns with rape. At Heggbach, peasant women threatened to turn the men loose on the nuns and, following the typical early modern motif of a "world turned upside down," demanded that the nuns should bear children and do farmwork, while the peasant women would live in the comparative luxury of the monastery. There were numerous women among the militant adherents of revolutionary preachers. During tumultuous actions in Thuringia and the Black Forest, women took up arms to defend these preachers. Thomas Müntzer ordered women to arm themselves and do battle for his cause. Instigated by townsmen, a group of women from Windsheim met to attack and pilfer a monastery in 1525. The women named one of their number as their officer. In the same year a group of women at Heilbronn formed a protest march, carrying with them the

Bundschuh (a heavy peasant boot connoting solidarity of laboring peasants), the symbol of the peasant rebels.

Two women who were believed to have magical skills became leaders or at least advisers of the peasant rebels. The first was a soothsayer who lived near Bludenz. She prophesized that even though the lords had gained the upper hand, the rebels would win the war within months. The other, the widow Margarethe Renner (Black Hofmännin), accompanied a criminal who had managed to become the leader of a peasant group. Hofmännin had refused to pay taxes and was rumored to be an accessory to murder. She tried to persuade the insurgents to attack the city of Heilbronn, which ruled over her village, and threatened to mistreat the women of Heilbronn's upper class. Hofmännin allegedly claimed that she had used magic to make the rebels invulnerable. After the conquest of the town of Weinsberg, Hofmännin took part in atrocities committed there. The insurgents executed several noblemen, defiled their corpses, and humiliated the countess of Helfenstein by driving her out of town on a dung cart. The Weinsberg outrages were widely reported and were used to justify the rigorous action that the aristocratic forces took against the rebels.

Unlike Luther, German theologian Thomas Müntzer sided with the peasants, emerging as the spiritual leader of the rebellion in Thuringia. Arriving at Mühlhausen in late 1524, Müntzer and Heinrich Pfeiffer drafted the Eleven Mühlhausen Articles, which called for the dissolution

of the existing municipal government and the formation of an "eternal council" based on divine justice and the Word of God. Although they were briefly expelled by their opponents in late 1524, Müntzer and Pfeiffer returned to Mühlhausen in 1525, establishing a communistic

theocracy and leading the struggle against local German princes. Convinced that God was on their side, Müntzer led some 8,000 peasants against the princes of Hesse and Saxony but suffered a devastating defeat at the Battle of Frankenhausen in May 1525. Captured and tortured, Müntzer recanted and accepted the Roman Catholic mass prior to his beheading in Mühlhausen on May 27, 1525.

Thus, in spite of initial successes the insurgents were no match for the better-equipped mercenaries of the aristocracy. Even though the Peasants' War ended with the total military defeat of the rebels in several territories, it had important consequences. It was among the most significant rebellions in modern European history, briefly shattering the rule of countless lords, small princes, and urban governments in the southern and central parts of the Holy Roman Empire. The revolt's long-term effects on the Holy Roman Empire are more difficult to assess. Many lords and princes seem to have exercised more caution in their dealings with the peasantry after 1525, and serfdom did weaken in southern Germany by the late sixteenth century. The imperial authorities also tended to direct disputes between peasants and lords into the courts and commissions of arbitration so as to avoid any new violent upheavals. The Peasants' War also played an important role in historical-political debates of the nineteenth and twentieth centuries. The conservative German historian Leopold von Ranke dismissed

the war as an event unworthy of serious analysis, while Friedrich Engels and Karl Marx considered it a pivotal turning point in German history; their interpretation of this event highlighted the peasantry's conservative nature and argued in favor of urban proletariat's leadership of future revolutions. But above all the Peasants' War was a human tragedy, as many German regions were devastated, and probably up to 100,000 peasants lost their lives. "Should someone wish to erect a victory monument because he has defeated the rebellious peasants," observed the great contemporary artist Albrecht Dürer, "let him use this design." Dürer's design featured a column with cattle, sheep, and pigs around its base. Farther up were baskets of bread, vegetables, fruits, and agricultural implements, symbolizing the peasantry's hard labor and central role in everyday life. On top of the column, however, sat a peasant with a sword plunged between his shoulder blades.

Economics and Trade

The global economy was transformed during the sixteenth century as new trade patterns emerged, connecting the Eurasian ecumenes with each other and incorporating the western hemisphere for the first time. The European Age of Expansion led to the discovery of the Americas and of new routes to Asia, setting into motion the forces that led to the emergence of European commercial and political influence on a global scale. Adam Smith, the great Scottish economist, was rather forthright in believing that “the discovery of America, and that of a passage to the East Indies by the Cape of Good Hope, are the two greatest and most important events recorded in the history of mankind.” Although Smith can be accused of clear exaggeration, the European discoveries certainly were among the major turning points in world history since they mark the start of “world trade” in the literal sense of the phrase. Nevertheless, Asian economies remained the strongest in the world during this period and drew Europeans like a magnet.

Prior to 1500 the largest share of trade was local and involved food crops, raw material, and local hand manufactures. Long-distance trade had flourished, and trade routes crisscrossed Asia, Africa, and Europe. But there was still no unified system of trade, and goods traveled in stages from one set of traders to another before reaching their final destination. In Asia, the famous Silk Roads connected China and India to the Ottoman empire and Europe. Goods moved along trans-Saharan trade routes, which were well integrated along an east-west axis, connecting northern, western, and central Africa. Within Europe, Italian city-states dominated the Mediterranean basin, while the Hansa League of the German cities exerted great influence over much of northern Europe. Aztec and Maya road networks connected various regions and cities throughout Central America, while the Incas developed a sophisticated network of roads along the western coastline of South America. The Indian Ocean was the great crossroads of international shipping. Bustling port cities housing a rich diversity of merchants of many ethnicities and religions filled the entire length of its littoral. Arab Muslim traders played the dominant role in the Indian Ocean basin, while Chinese traders controlled the East Asian waterways. Yet neither Arabs nor Chinese and other merchants sailed into the Atlantic or Pacific oceans. Sailing in what was the most lucrative region in the world, they felt no need to expand their operations into unknown areas. Unlike Europeans, who dreamt of reaching the wealth of India and China, these merchants were already there.

By the eighteenth century, however, economic realities had changed. Europeans were sailing on most of the world's seas, operating freely in the Atlantic and Pacific oceans. Russia's land expansion across Eurasia

integrated parts of northeastern Asia into a larger trade network. The European naval expansion forged new connections across the world, the most striking of them being those across the Atlantic and Pacific oceans. The inclusion of Asia and the Americas (and later Australia and Oceania) into this global economic system intensified interregional trade and promoted the spread of new crops and goods. But it also had adverse effects. Historically, the Indian Ocean trade was regional and highly specialized, with each region producing products that were locally raised or manufactured. India was known for its superb textiles and dyes; Southeast Asia produced precious gems and spices; East Africa served as a source of ebony, ivory, and slaves; while Arabia and Persia were known for horses, incense, and woven tapestries and carpets. Europeans transformed this regional commercial network by connecting them to each other as well as to the Atlantic, Pacific, and Mediterranean trade networks. Commercial power thus became global rather than regional, and Europeans, who monopolized global shipping, became power players in it. From the seventeenth century onward, European companies ensured that the wealth flowed out of the Indian Ocean directly into Europe, circumventing the great Islamic empires that used to control it for centuries and derived substantial benefits from it.

Age of European Expansion and Economic Transformation

Starting with early Portuguese and Spanish maritime exploration for new routes to Asia, Europeans began to utilize new technological innovations to get into new markets in Asia. They sought to reduce their reliance upon Muslim traders, who had delivered the goods and spices of the “East” for centuries before, and to profit from direct trade with India and China. After all, Columbus sought a new western route to India, not a new land that we now know as the Americas. Chinese tea, silk, and porcelain, as well as the spices and textiles of India and Indonesia were highly desirable in Europe, prompting Europeans to cross the oceans to get them. After the discovery of the Americas, Europeans fully employed its vast riches (primarily silver) to buy their way into Asian markets and advance their own economies. In 1500 the global economy centered on Asia, but some 250 years later the epicenter of the emergent global economy lay in the Atlantic world, where Europeans developed a triangular trade involving Europe, Africa, and the Americas.

Yet Europe’s influence on Asia was more modest than in the Americas, where Europeans established colonial empires and exploited local populations. Several factors played a role in this. To start with, the estimated population of Asia was about five times that of western Europe. Furthermore, Asians were immune to the European diseases that wrought such devastation on the Native Americans. Asian destinations were more remote than American, and more importantly, Asian states possessed a technological level that was as sophisticated as and sometimes superior to European states. Thus, Asian states were better positioned than the Aztecs or Incas to resist European conquest. Despite their success, Europeans did not monopolize all Asian shipping. Local Muslim, Hindu, and Chinese traders remained active throughout the region, oftentimes having an upper hand over their Christian brethren. But Europe dominated transoceanic trade, particularly in the Atlantic, and developed a network of trade outposts along the African and Asian coastlines. In Japan, despite an isolationist policy, the Tokugawa shoguns allowed Dutch traders access to the port of Nagasaki. Even in China, where a strong central government prevented European expansion into the mainland, the Portuguese still managed to establish their presence at the important port of Macao. Such outposts provided Europeans with access to overland trade routes and goods that were otherwise inaccessible to them. In the Americas, the collapse of local Amerindian states in the wake of European arrival meant that the region became almost completely dominated by European states. Population losses due to diseases as well as European technological advantages facilitated the rise of colonial enterprises in the Western Hemisphere. Spain took the lead in the process, creating the *encomienda* system

In 1500 the global economy centered on Asia, but some 250 years later the epicenter of the emergent global economy lay in the Atlantic world, where Europeans developed a triangular trade involving Europe, Africa, and the Americas.

that granted a Spanish colonist the right to exact tribute from a certain number of Amerindians in a specific area. In theory Amerindians remained free and the *encomienda* system provided royal protection to them, but in reality the local populace was brutally subjugated. Thus, the Spanish *repartimiento* system in Mexico and the *mit'a* system in Peru allowed colonists to employ Amerindians for forced labor, in essence subjecting them to slavery.

The opening of new trade lanes to the Americas and Asia shifted the main focus of Europe's trade from the Mediterranean to the Atlantic, while the established land routes through Islamic states were eclipsed by new naval trade lanes. European penetration of the Asian oceans was facilitated by the withdrawal of China and Japan from international trade and a lack of interest in naval trade from India and Iran. Until the eighteenth century, European trading posts in Asia were nearly all on the coastal periphery, although the Dutch did gain control over considerable territory in Indonesia in the early seventeenth century. The total volume of European shipping in Asian waters rapidly increased between the sixteenth and eighteenth centuries. The volume of trade was four times as big in the seventeenth century as it had been in the sixteenth century and nine times as big in the eighteenth century.

Naturally, not all European states benefited from this growth. Portugal became a marginal participant, with about 3 percent in the eighteenth century. On the other hand, the Dutch accounted for half of the expanded trade, while the British, with about a quarter, were a close second. The European market for the traditional export of spices was limited, but European demand for export items created new markets for cotton textiles from India, coffee and spices from Arabia and Indonesia, and raw silk, porcelain, and tea from China. European companies contributed to the rise of new centers of commerce in such places as Bombay, Calcutta, and Madras and encouraged the growth of some Asian industries. Thus, recent studies reveal that British and Dutch purchases of textiles accounted for about 11 percent of textile employment in Bengal in the period 1678–1718. Although in China the Ming dynasty renounced large-scale international trade by the late fifteenth century, Chinese manufacturing profited greatly from increasing European demand, which sent most of the American silver to China to pay for the goods.

Some Asian states failed to exploit economic opportunities that came with European arrival; success often depended on the personality of the ruler. In mid-sixteenth-century Iran, domestic and foreign threats stalled the economy, while Shah Tahmasp (1524–1576) tolerated rapacious appropriation of resources and material wealth by the elites. In fact, the shah played a leading role in this process. Upon his death, it was discovered that his treasury contained millions of gold and silver coins, 600 ingots of gold and silver (30.5 pounds or 13.8 kilograms each), 200 kharwars of silk (650 pounds or 295 kilograms each), and 30,000 pairs of fine and expensive garments. This enormous capital had languished unproductively for years in the treasury instead of being effectively invested or managed. At the same time, the shah's propensity to increase the rate of taxation while little was done to enhance production was bound to impoverish the masses of people. The reign

of Shah Abbas I (1587–1629) briefly stopped the process of economic stagnation. The shah restored internal peace and stability in the country and injected surplus revenue back into the economy, encouraging production and trade. He reorganized taxes, repaired the decayed irrigation systems, constructed roads and caravanserais, and suppressed crime and brigandage. As trade and commerce grew, many Iranian towns favorable to foreign trade expanded as well. Bandar Abbas, on the Persian Gulf, was transformed from a small village into a major commercial center.

But the shah's reign was not without fault. As a despot he encouraged production while that production served his purposes but strove to limit individuals' ability to accumulate and invest wealth. No institutional framework existed to protect property rights. For example, the shah had the right to declare himself heir to whomever he pleased. This legal insecurity led those who had acquired some surplus wealth to hoard rather than to invest to avoid being exposed to the despot's rapacity. The state also held monopolies on some trades and manufacture. In such circumstances, a political crisis (e.g., death of the shah or weakening of the central authority) inevitably caused an economic crisis. International factors only exacerbated the problems. John Fryer, an Englishman who visited Iran during 1672–1681, suggested that “the discovery of the sea route” to India by the Europeans may have also contributed to the decline of the Persian economy. In his view, the decline of Isfahan, one of the largest commercial centers in Iran, was undoubtedly caused by this discovery. In Fryer's book *A New Account of East India and Persia—Being Nine Years of Travels, 1672–81* (1698), he speculated that it was because “it was the storehouse and general market for Indian wares as well as its own,” whereas by then “it became a lake, in which riches do now stagnate, not circulate, or at least not with the force they did before.”

China's experience in the emerging global economy is striking as well. In 1400 China was the world's leading economy in terms of per capita income and outshone Europe in terms of technology, use of natural resources, and capacity for administering a vast empire. China's commerce flourished in the great cities of Beijing, Hangzhou, Guangzhou, and Nanjing, whose populations counted in the millions. Yet 300 years later, western Europe was overtaking China in per capita real income and technological and scientific development. Several factors contributed to such a decline. China turned its back on naval exploration and trade just as Europe was embarking on transoceanic voyages, and the court remained largely isolated from foreign commerce during large parts of the Ming and Qing dynasties. More importantly, China, which possessed some of the most sophisticated technologies, did not fully appreciate the Western technological challenge and restricted itself to an ethnocentric outlook that praised domestic achievements and ignored developments outside China. As a result, much of Europe's technological and economic

John Fryer, an Englishman who visited Iran during 1672–1681, suggested that “the discovery of the sea route” to India by the Europeans may have also contributed to the decline of the Persian economy.

development between 1500 and 1800 remained unappreciated in China. China's famous bureaucracy of professionally trained public servants, recruited by examination on a meritocratic basis, had a negative long-term effect as well, since the best and brightest minds were occupied with Confucian studies, leaving very few intellectuals focused on such mundane matters as engineering, mathematics, or science. The end of the Ming dynasty coincided with a period of commercial expansion, but both the Ming and Qing dynasties emphasized development of China's vast internal trade networks, seeing little benefit in enriching foreign economies. Both allowed commercial missions under the guise of diplomatic "tribute missions," but the goal was Chinese self-sufficiency rather than international expansion. In that regard, however, it is important to emphasize that China doubled in size during the reign of the Qianlong emperor (1711–1799). China was expanding its land empire at the same time that Europeans were launching outward to sea.

Initially there was relatively little demand for European goods in Asia. On the contrary, the introduction of better-quality products from Asia had a major impact on European manufacturing. For example, when it came to textiles, the arrival of high-quality Indian textiles caused great concern among local manufacturers in England, who in 1699 rioted in protest. Shortly thereafter Parliament prohibited the import of all dyed and printed cloth from India. Such protectionist policies facilitated the development of English textile manufacturing, which later played a decisive role in the demise of India's handloom textile business. Indeed, by the eighteenth century Europeans used their profits to improve their own manufacturing base and then sold their manufactured products (metalwares, cloth, weapons, etc.) throughout the world. The mercantilist doctrines urged European states to monopolize as much manufacturing as possible, while much of the world retained its emphasis on agricultural production and the extraction of natural resources that sustained growing European demand for such products. Thus, the nature of economic interactions had changed in a profound way. By the eighteenth century Europe turned parts of the world into sources of natural resources from which its industries fabricated finished goods that were then sold at substantial profit around the world.

Slave Trade

Starting with the Portuguese, European traders altered trading patterns in western Africa, drawing the region into a European-dominated Atlantic economic network and away from traditional trans-Saharan trade. European imports also reduced local craft production. More importantly, European arrival on the coast of western Africa marked the start of an international slave trade that had a major impact on the region. Portuguese, Dutch, English, and French traders purchased west Africans to be sold in the Americas. Although the slave trade was not new to Africa, there had been a long and sustained demand for slaves in the Islamic world, but the European slave trade raised this practice to a completely new level. Between the sixteenth and nineteenth centuries, an estimated

10 to 12 million Africans were enslaved and taken away from their native land. This massive exodus devastated local African communities and affected their economic, social, and cultural development. Yet the slave trade also profited some African communities, since European rarely ventured beyond the African littoral. The Africans accomplished the actual procurement of slaves and traded them for European weapons and manufactured goods. Such practices encouraged local rivalry and conflicts, shifting wealth and power from the continent's interior to its coastline.

Europe, on the other hand, benefited substantially from the slave trade, which became one of the cornerstones for the transatlantic triangular trade. Sailing from bustling ports such as Amsterdam, London, Lisbon, and Nantes, European traders carried guns, textiles, and other manufactured goods to Africa. There at coastal trading posts they traded their goods for slaves, whom they then transported across the Atlantic to slave centers in the Americas to be sold or exchanged for colonial goods (sugar, coffee, tobacco, etc.). Returning to Europe, the traders sold these colonial goods at a great profit, part of which they then reinvested in new trading trips to Africa. The slave trade played a central role in the shift of the global economy from the Indian Ocean to the Atlantic Ocean, facilitating Europe's rise as a dominant economic power. African slaves worked on plantations that produced cash crops and mined much of the silver that fueled the European economy. The Atlantic commerce helped jump-start the European Industrial Revolution and sustained military expansion that allowed Europe to project its power across the globe.

Between the sixteenth and nineteenth centuries, an estimated 10 to 12 million Africans were enslaved and taken away from their native land. This massive exodus devastated local African communities and affected their economic, social, and cultural development.

The Price Revolution

In the sixteenth century, gold and silver were the most valuable products of the Americas. Silver was readily available in the mines of northern Mexico and the Potosi mines, located in the area of modern Bolivia. The Potosi site, discovered in 1545, held the largest silver deposits in the world. Some 40,000 Native Americans were employed in dreadful conditions. Between 1550 and 1800, over 80 percent of the world's silver and more than 70 percent of the world's gold originated in Mesoamerica and South America. Spanish galleons, laden with silver, sailed twice a year from the Americas to Spain, one shipment from Vera Cruz carrying Mexican silver and the other from Portobello with Peruvian bullion. Eventually a large percentage of the precious metals, particularly silver, was used in the Asian trade, sustaining European trade with China and India. Europe produced very little other than the silver that interested Asian traders. Eventually over one-third of all American silver produced between 1527 and 1821 ended up in China, where Europeans bought exquisite porcelain, silk, and tea.

Silver Shipments from Americas to Europe (metric tons) (Cambridge: Cambridge University Press, 1985).

(Source: Morineau, M. Incroyables gazettes et fabuleux métaux, 570.)

The vast influx of precious metals into Europe set off a round of inflation. The increase in the amount of gold and silver caused rapid rises in prices, which in conjunction with an increase of population disrupted the economies of some European states. The European population expanded in the wake of the Black Plague, and the number of cities with 100,000 inhabitants or more rose from five in 1500 to over a dozen in 1600. The population of the countryside, the villages, and small towns expanded as well. Rapid population growth created a heavy demand for food supplies, which farmers, despite improved agricultural methods and new crops, struggled to meet. Throughout the sixteenth and seventeenth centuries demand outstripped supply, causing prices to rise, while the abundance of gold and silver depreciated wages. The prices of basic consumable goods in England quadrupled between 1500 and 1600, while in Spain annual increases in prices averaged 2.8 percent between 1501 and 1562 and 1.3 percent per year afterward. In England the wages of construction workers doubled, but prices on food increased four and even five times, causing economic distress to wage earners. In Spain the increased supply of money accelerated inflation and prompted currency debasements, which only further undermined the economy. The Spanish monarchy declared bankruptcy in 1557, and suspended payments on its debts in 1575, 1596, 1607, 1627, and 1647. These defaults made future loans prohibitively expensive for Spain and stalled potential reforms that could have modernized the nation's economy. The effect of the price increases and inflation, however, was not uniform and variously affected European states. In England and the Netherlands, owners of fairly large estates did better due to rising prices than did smaller landowners. But in France minor nobility struggled to adjust, and many of its members had to turn to military careers. Price increases oftentimes provoked unrest and rebellions. In southwestern

Germanic states, local princes caused peasant uprising by imposing new taxes to offset price increases.

The availability of more money stimulated manufacturing and commercial enterprise because borrowing was less costly when money was losing value. A merchant could afford taking risks because a loan he took one year would be worth less, in real terms, three or five years later when money was due. This encouraged commercial risk taking, especially since colonies presented new markets to exploit. The trade boom facilitated the expansion of the banking industry, which had flourished in some parts of Europe in the fourteenth century. Renaissance Italy was a fertile ground for banks, with perhaps the most famous Italian bank run by the Medici family. In the fifteenth century, the Fugger family rose to prominence and replaced the Medicis as the leading bankers of Europe. Jacob Fugger rapidly expanded his family's commercial enterprises, setting up a chain with branches in all the major cities of central and western Europe. So great was the bank's wealth that it was able to rescue indigent kings and princes. In 1519 Fugger's financial support proved decisive in the imperial elections of the Holy Roman Empire.

In 1600 Spain and Portugal, the countries that spearheaded European colonial conquests in the sixteenth century, played limited roles in Europe's commercial life. Spanish and Portuguese merchants focused their efforts on extraction and transportation of precious metals, lacking the flexibility shown by other European traders, especially the English and Dutch. Neither Portugal nor Spain possessed well-developed infrastructures to absorb all the exports of their colonies or distribute them effectively. As a result, other commercial powers (England, the Netherlands, the Italian states, and the north German states) profited far more from colonial exploitation. The Netherlands particularly benefited in the new economic environment, causing some scholars to identify it as the first "modern" economy. Its cities, especially Antwerp and Amsterdam, took advantage of their location, a thriving local industry, and a rapid increase in bulky seaborne trade to emerge as the leading commercial centers in Europe. The Netherlands, a highly urbanized region, required imports of vast food supplies that facilitated the development of their merchant fleet, which soon came to dominate Atlantic transportation. Even Spain, which was engaged in a prolonged conflict with the Dutch, could not avoid the services that the Dutch merchants provided. The rise of Dutch and English trade centers came at the expense of other trade powers. The Republic of Venice, once the dominant trade power in the Mediterranean, declined to a second-rate status because it failed to adapt to new economic realities and had continued conflicts with the Turks. The Hanseatic League, which exerted great influence over northern Germany and the Baltic, also experienced a decline in its trade, much of which was lost to the more aggressive Dutch. By the mid-seventeenth century the Dutch themselves were

challenged by England and France, both of which embarked on colonial empire building. The Anglo-Dutch Wars (1652–1654, 1665–1667, and 1672–1674) and the coalition wars against France marked the turning point in Dutch history. The Netherlands lost many of its colonies and ceded control over seas and trade lanes to the British.

Old World's New Ventures

Following the first wave of exploration and discovery, European financiers developed a few commercial innovations that gave them a vast advantage in overseas trade, such as further developing the extended commercial networks that had emerged in Europe in the medieval era and improving banking, which together laid the basis for a brisk growth in trade. Financiers and traders commonly used bills of exchange that eased business transactions since traders no longer had to carry vast amounts of gold and silver on their long and oftentimes dangerous journeys and could simply exchange promissory notes that could be cashed at a later point.

The infusion of gold and silver increased the credit supply that made it easier for financiers to pool their resources for long-term enterprises. Starting in the mid-sixteenth century traders began to raise capital required for their activities by selling stocks to finance overseas expeditions and paying dividends from profits gained from these ventures. The joint-stock companies chartered to trade in the Americas became known as the “West India Companies,” while those sailing to Asia were known as the “East India Companies.” Among the first such enterprises to be established were the English East India Company (EIC) and the Dutch East India Company, founded in 1600 and 1602, respectively; France was a relative latecomer, with its East India Company established only in 1664. Although officially independent of each

government, these trading companies recognized that it was in their best interest to further the state's interests.

Outside Europe, many traders developed economic enterprises around family-held businesses, rarely developing impersonal business practices such as joint-stock companies. In contrast, European companies, drawing on the capital of their financiers, conducted business across the oceans, carrying spices, raw silk, textiles, tea, porcelain, and other commodities. With their fleet fully armed and ready to fight, the joint-stock companies oftentimes used force to enter local markets and built fortresses to protect their interests. In the seventeenth century the Dutch East India Company eclipsed all of its rivals in Southeast Asia.

➤ THE DUTCH EAST INDIA COMPANY

Between 1500 and 1800, the Dutch East India Company accounted for 45 percent of the European voyages to Asia. Established in 1602, the company held a Dutch monopoly on trade with Asia and successfully organized a trade with heavy capital outlays over extended periods. Dutch ships were armed, and the company had the power to wage war, make treaties with Asian rulers, establish fortified ports, and enlist soldiers and administrators. The company maintained a fleet of about 100 vessels, each of them replaced after about ten years of sailing. Over the lifetime of the company, 1,500 ships were constructed for Asian trade, and by 1750 the company employed more than 12,000 sailors and 17,000 soldiers and administrative personnel in Asia.

Between 1602 and 1796 the company sent out almost 1 million Europeans to work in the Asia trade with nearly 5,000 ships, close to twice the number of ships sent by its nearest competitor, the English East India Company. Arriving in India at the Malabar Coast in 1604, the Dutch company extended its authority to the Indian coastline and Ceylon by 1610 and to Indonesia by 1620. Establishing their center at Cochin in 1663, the Dutch East India Company maintained a virtual monopoly on the pepper and cinnamon trade for the next 130 years.

Coming in the wake of the Portuguese and the Dutch, the EIC soon eclipsed its rivals and consolidated and expanded its operations in India. By the mid-seventeenth century it was involved in a wide variety of commercial enterprises, shipping spices and tea to Europe, cloth from southern India to Sumatra, and coffee from Arabia to India. Following its victories at Plassey in 1757 and Buxar in 1765, the EIC took control of the Bengal region of India, laying the foundation to the future British Empire in India.

Emerging Economic Theories

The new overseas trade opportunities had a profound impact on Europe, restructuring public life and gradually increasing the power of private business. Outside Europe, governments largely continued to dominate business interests in many areas, such as the Ottoman empire, India, Iran, China, and Japan. At the same time, business interests in some European states challenged established political order, seeking a greater political role in the government. The gradual transformation of the European state was driven by a new system of trade and exchange that we now call capitalism. As an economic system, capitalism is characterized by private (or corporate) ownership of wealth and the means of production and private control over major economic decisions (e.g., price, distribution, etc.). Such networks advocated the establishment of free competitive markets where private interests could pursue their economic interests. Although capitalist thought desired fewer regulations from state and church, they did depend on the support of the state in protecting them from foreign competition. Early capitalists often called upon governments for support in their commercial enterprises. Italy, where vibrant commerce and banking had been evolving since the Crusades, proved to be a fertile ground for capitalist ideas. Capitalists gained control of the governments in some city-states, such as Venice, Florence, and Genoa, where the state's resources were often expended in support of commercial pursuits.

Other European states followed a different trajectory. For instance, mercantilist theory predominated in France and Spain. Mercantilism advocated tighter government control of trade and commerce and, in particular, restricting the flow of gold and silver. The goal of mercantilist policies was to obtain maximum wealth, believed to benefit both the sovereign and the nation as a whole. In its early stages mercantilists believed that whoever possessed the most bullion—that is, gold and silver, which were the primary payment methods used in transactions—could

➤ PROTESTANTISM AND CAPITALISM

In the early twentieth century the prominent social scientist Max Weber put forth an argument that Protestantism's emphasis on hard work, individual achievement, and divine grace contributed to the emergence of capitalist enterprise. Weber argued that the Protestant doctrines encouraged followers to demonstrate their virtue through industriousness. Adherents were encouraged to find satisfaction in hard work. Protestantism created a pool of "sober, conscientious, eminently capable workers who regarded their labor as their divinely ordained purpose in life."

Weber's thesis, however, has provoked a long debate among scholars. Some challenged the notion of religion ceding the central place in life to the pursuit of economic gain. Others noted that capitalist practices could be observed prior to the Reformation, and in later periods some Protestant areas were not capitalistic while certain Catholic areas were. Yet debates over the relationship between business practices and religious doctrines, whether Protestant or Catholic, remain unresolved.

wield greater political and military authority. To achieve this the mercantilist doctrine urged the state not to import goods from outside its own boundaries but instead to sell exports as widely as possible in its own ships, thus increasing the inflow of gold and silver. To protect domestic manufacturing, safeguard national production and labor, and add a competitive edge to its products, the state should prohibit the import of foreign products or at least use tariffs to hamper them. Mercantilists promoted colonial expansion to secure sources of natural resources and, if possible, control over large populations that might provide abundant manpower at low wages. Mercantilist policies, however, prompted economic, military, and colonial rivalries between European states because the policies positioned states in direct competition with each other for colonial expansion and wealth. Since this theory posited resources to be finite, success in one country could occur only at the expense of another. King Louis XIV's minister of finance, Jean-Baptist Colbert (1619–1683), was one of the most vigorous

adherents of mercantilist thought, and his name is often used as a synonym for mercantilism. In charge of the French economy between 1665 and 1683, he worked hard to make France economically self-sufficient and to increase the nation's wealth. He promoted the establishment of trading companies (creating the West India Company in 1664), worked to increase exports, developed a commercial code, and improved communication within the country by building roads and canals. Colbert fostered colonies abroad, in particular in North America, where he sought to increase the labor supply by sending hundreds of indentured workers, settlers, and marriageable girls annually. His policies generated enormous revenues for the Crown, which Louis XIV unfortunately squandered on wars.

By the early eighteenth century some European economists began to consider the policies of the mercantile system to be erroneous. François Quesnay in France and Adam Smith in Britain advocated an end to government restrictions that limited the potential for economic growth. They favored a limited role for government, or a *laissez-faire* society where a government's role would be limited to providing defense against external aggression, administering justice, and preserving competition, and building and maintaining public works and institutions such as roads and schools. These economists argued that the principles of supply and demand would best regulate the movement of goods and the level of prices.

Trade and Colonial Conflicts

As the volume of international trade increased, so did its relative importance for a state's economy. Protecting overseas trade and major commercial sea-lanes became part of the geopolitical considerations. European naval advantages—a powerful technological combination of full-rigged, stoutly built ships carrying large effective cannon and handling large payloads—allowed European ships to force their way into local trade networks. In the early 1500s the Portuguese used their naval technological advantage to defeat Muslim navies in the Indian Ocean and take control of sea-lanes; a century later the English, French, and Dutch did the same. Although Asian states possessed sophisticated naval technology that equaled or in some cases (e.g., China's treasure ships) eclipsed European technology, Europe's naval activity was a result of complex socioeconomic factors that Asian (or African) states struggled to replicate. More importantly, most non-European states were land-based empires and had little interest in the seas or maritime trade. The income of the Indian rulers, including the Mughal emperors, was derived from land taxes, and they had no significant financial interest in foreign trade. China could have posed a major obstacle to European naval expansion in the Indian Ocean, but in the midst of the food-production uncertainties created by an exploding population, China was preoccupied by other concerns and showed little interest in external trade. With the exception of the Ottoman empire, no state navies challenged Europeans on the sea, permitting them to establish a virtual monopoly on transoceanic trade.

In India, the Mughals developed a powerful army to maintain their empire, but they had no navy. The Mughals were uncertain about the nature of the European threat. While India had been invaded by land for centuries, the Europeans came by sea, did not seem to be invading, and instead sought economic relations to which the Mughals had no objection. Yet once Europeans secured their mastery of the seas and gained a foothold on the coasts

of the Indian subcontinent, expelling them proved to be nearly impossible. Thus, in 1686 following tensions with the Mughals, the EIC blockaded Mughal trade with Southeast Asia. Mughal emperor Aurangzeb responded by expelling the English from their settlement at Hoogly but, lacking naval capacity, could do nothing against them on the seas. The English relocated to Calcutta and continued their commerce and armed competition.

European naval activity had a momentous consequence. Outside the Americas, Europeans pursued their colonial interests by establishing coastal entrepôt empires, a series of trade outposts connecting far-flung regions via sea-lanes. By the eighteenth century, control of the sea-lanes became one of the key national interests for many European states. Thus, the English statesman Henry St. John, Viscount

The Mughals were uncertain about the nature of the European threat. While India had been invaded by land for centuries, the Europeans came by sea, did not seem to be invading, and instead sought economic relations to which the Mughals had no objection.

Bolingbroke, explained that “As trade and commerce enrich, so they fortify our country. The sea is our barrier, ships are our fortresses, and the mariners, that trade and commerce alone can furnish, are the garrisons to defend them.” Such views contributed to the formulation of a new type of war, the *guerre de course*, or war against commerce, that entailed harassment of an enemy’s merchant shipping and attacks on its colonies. Such focus on the need to control the seas, at a time when the rest of the world was inland looking, meant that by the mid-eighteenth century European states, particularly Britain, exercised unrivaled mastery of the high seas.

Following the conquest of the Americas, the Spanish government tried to maximize its profits from trade in colonial goods. Spain confined trade in its colonies to Spanish nationals only and put in place rigid regulations to protect the system. Only a few specially designated colonial ports were allowed to ship goods to Europe, while all commercial transactions were subject to the *casa de contratación* in Seville. The Spanish system, however, had major drawbacks, since it restricted economic growth and facilitated corruption and smuggling. Such an arrangement also contributed to the outbreak of conflicts between Spain, England, and France, whose traders yearned to trade in the Americas and continued to lust after the wealth of the East. Asian economic systems were still viable but were beginning to falter as the period ended.

—Alexander Mikaberidze

■ Introduction: Innovations in Domestic Economy and Trade

The new overseas trade opportunities had a profound impact on much of the world and above all on Europe, where public life endured a thorough restructuring and the power of private business gradually increased. Capital was accumulated and was productively invested, contributing to the development of new forms of social organization used to exploit economic opportunities. Outside of Europe, the governments largely continued to dominate business interests, such as in the Ottoman empire, India, Iran, China, and Japan.

Merchants played a vital role in the economic life of the Islamic world, highlighted by the fact that the prophet Muhammad himself was a merchant during the earlier part of his life. During the Islamic Golden Age (eighth through twelfth centuries), the Islamic world witnessed the development of early forms of protocapitalism and free markets with their bills

of exchange, checks, promissory notes, transactional accounts, etc. Many of these early capitalist concepts were later adopted and developed by European merchants. The Quran contains several references to commercial activities but no specific rules that prompted Muslim jurists and theologians to lay down several fundamental principles that regulated Muslim commercial activity for generations. Muslim theologians argued that a merchant should begin his transactions with good faith and intentions and consider trade as a social duty. He therefore had to avoid any forbidden and suspicious business and carefully watch his words and deeds in business. Most importantly, he was not allowed to charge interest on loans. The last tenet, prohibition of usury, was widely debated in the Islamic world, with both sides of the argument citing Quranic verses and *hadiths* to support their positions. Thus, the economic reality varied depending on

a location, and interest-bearing loans took several practical expressions. The most widespread of them was *istighlal*, whereby when a man received a loan he immediately sold his house (or other property) to the creditor, who then leased it back to the borrower for the duration of the loan. If the creditor repaid his loan on time, he could reclaim his house; if he failed, then the parties could continue with the lease, with a rent now constituting an interest payment. The expansion of Islamic trade in the East and West also led to the adoption of trading patterns that prevailed in these localities. Investment in commercial enterprises took many forms. *Mudharabah* was a limited partnership whereby one partner gave money to another for investing it in a commercial enterprise, while profits generated were shared between the parties according to their initial agreement. *Musharakah* was a joint investment venture of two or more parties who jointly contributed capital to a business and divided the net profit and loss. Muslim merchants made wide use of *sukuks*, financial certificates that were the Islamic equivalent of European bonds, although interest-bearing bonds remained prohibited.

The situation was different in China, where the imperial court did not distinguish between foreign and domestic trade. The court believed that the world was composed of one true civilization with one true ruler, the emperor, who represented all humanity before the heavens. Thus, the Chinese scholars referred to their state as *Zhongguo* (the Middle Kingdom), implying that it was at the center of the civilization. Within this civilization there were those who were ruled directly by the emperor and those who were subject to various levels of subordination to the emperor (e.g., neighboring native chiefs and kings who delivered regular tribute and were allowed to trade within China). Meanwhile, an outermost circle of “barbarians” was completely excluded from tribute but given either limited rights of direct trade or traded indirectly by including their goods in the tribute offered by somebody else. Moreover, the trade of goods also carried an important symbolism because the foreigners were supposed to bring exotic goods that would have highlighted the emperor’s exalted status. The goods given by the

emperor in return (silk, porcelain, books) were symbols of refinement of the Chinese culture.

Thus, on the one hand Chinese political theory affected attitudes toward economy by concerning itself with status and culture instead of profit maximization. But China’s ruling dynasties also promoted trade and commerce with neighboring client states by expanding tribute trade and rewarding political loyalty. This had left foreign trade in the hands of foreign merchants. In the early fifteenth century China began to trade overseas. Chinese ships and merchants appeared in Japan, the Philippines, Indonesia, and Southeast Asia, while the Chinese admiral Cheng-ho led the famous naval expeditions into the Indian Ocean littoral. But this changed in 1433 when the emperor forbade further voyages, decreed the destruction of oceangoing ships, and prohibited his subjects from traveling abroad. Neighboring countries continued to pay tribute in exchange for the right to send trade missions to China. The Ming regulations limited the size and number of such missions, restricting them to certain ports. Although the Chinese economy did not break fundamentally new ground during the sixteenth through eighteenth centuries, Chinese levels of achievement remained high, and manufacturing and internal trade surpassed previous levels, allowing the nation to largely ignore Western goods. But much production lay in the hands of rural cottage artisans who lacked capital to seek economic expansion, while the Chinese upper class, rooted in traditionalism, looked disdainfully at purely economic activity. The Portuguese, who reached China in 1514, initially caused imperial irritation by their disrespect of Chinese laws. In 1522 Chinese forces drove them out of Guangzhou, but the Portuguese persisted in their efforts to trade with China. In 1557 China allowed them to set up a trading post at Macao in return for paying annual tribute. Over the next few centuries Macao turned into a major center for the commerce between China and Europe. At the same time, China’s refusal to open its domestic market prompted the Japanese and the Koreans, who were unwilling to pay tributes required for official trade, to turn to piracy. By the seventeenth century piracy became an organized industry that was perpetrated by raiding companies, some of which involved Chinese.

Unlike other parts of the world, Europe went through remarkable economic transformations between 1500 and 1800, including commercial expansion and growing financial sophistication. This period saw the gradual development of the European banking industry. The banks successfully circumvented the Catholic Church's ban on usury, which condemned any interest beyond the principal, by using the bill of exchange, which entailed a merchant lending money in one currency and receiving repayment (after a fixed amount of time) in another, with the profit disguised in the exchange rate. Of course, the fluctuating nature of exchange rates made the precise return on the bill uncertain, but the bank mostly profited from it. The Italian banks fell upon hard times in the sixteenth century and were soon eclipsed by the German banks, the most famous of them being the great Fugger company from Augsburg. The Fugger family created a Pan-European banking empire that engaged in a wide range of commercial activities, including speculation in the money market, trade in commodities, and extending credit to states. The Fugger bank survived until the seventeenth century, when its practice of extending large credits to rulers finally brought it down. Besides these major banking conglomerates, there were numerous local deposit banks that took in deposits and invested some of their savings in commercial ventures. However, the volatile nature of such investments often led to bankruptcies. The governments sometimes tried to restrict such practices and sometimes directly interfered in the banking operations, leading to the development of publicly controlled deposit banks that became particularly successful in Spain and Italy in the second half of the sixteenth century and in the Netherlands and Germany in the seventeenth century.

The European Age of Expansion, with its high demand for great capital investments for transoceanic journeys, contributed to the development of international banking and credit instruments. In the Netherlands, the Antwerp and Amsterdam bourses emerged as permanent markets where tradesmen could raise capital for their commercial enterprises. The spread of Protestantism allowed the Dutch to make lending at interest legal, while laws against usury

remained on the books in much of the Catholic world. The first modern banknotes—initially receipts used to reclaim the whole deposit but later presentable for part payment and assignable to others—appeared in London in the late seventeenth century. Yet similar ventures in Sweden and France ended in disaster and left a lingering public distrust of the banking business. Indeed, when an ordinary European needed a loan, he obtained it not from a bank but rather from a pawnbroker.

The gradual transformation of the European state was driven by a new system of trade and exchange that we now call capitalism. An economic system, capitalism is characterized by private (or corporate) ownership of wealth and the means of production and private control over major economic decisions (e.g., price, distribution, etc.). Such networks advocated the establishment of free competitive markets where private entities could pursue their economic interests. Although capitalist thought desired fewer regulations from state and church, early capitalists oftentimes asked governments to support their commercial enterprises. Italy, where vibrant commerce and banking evolved since the crusades, proved to be fertile ground for capitalist ideas, and city-states such as Venice, Florence, and Genoa saw capitalists gaining control of the government and using the state's resources for commercial pursuits. Other European states, however, followed a different trajectory. Thus, in France and Spain the governments embraced mercantilism, which advocated tighter government control of trade and commerce and particularly restricting the flow of gold and silver. The goal of mercantilist policies was to obtain maximum wealth, which was considered to benefit both the sovereign and the nation as a whole. In its early stages mercantilists believed that whoever possessed the most bullion—that is, gold and silver, which were the primary payment methods used in transactions—could wield the greater political and military authority. To achieve this, the mercantilist doctrine urged the state not to import goods from outside its own boundaries but instead to sell exports as widely as possible in its own ships, thus increasing the inflow of gold and silver. To protect domestic manufacturing and

add a competitive edge to its products, the state should hamper (through tariffs) or outright prohibit the import of foreign products, safeguarding national production and labor. Mercantilists promoted the importance of colonial expansion to secure sources of natural material and satisfy the need for a large population, which provided abundant manpower at low wages. Such policies, however, prompted economic, military, and colonial rivalries between European states, since colonial expansion and continuous demand for wealth in one country could occur at the expense of another. King Louis XIV's minister of finance Jean-Baptist Colbert (1619–1683) was one of the most vigorous adherents of mercantilist thought, and his name is often used as a synonym for mercantilism. In charge of the French economy between 1665 and 1683, he worked hard to apply mercantilist principles, seeking to make France economically self-sufficient and to increase the nation's wealth. He promoted the establishment of trading companies (creating the West India Company in 1664), worked to increase exports, developed a commercial code, and improved communication within the country by building roads and canals. Colbert fostered colonies abroad, in particular in North America, where he sought to increase the labor supply by sending hundreds of indentured workers, settlers, and marriageable girls annually. His policies generated enormous revenues for the Crown that Louis XIV unfortunately squandered on wars.

By the early eighteenth century, some European economists began to consider the policies of the mercantile system to be erroneous. François Quesnay in France and Adam Smith in Britain advocated an end to government restrictions that limited the potential for economic growth. They favored a limited role for government, or a *laissez-faire* society, whereby government's role would be limited solely to providing defense against external aggression, administering justice (and preserving competition), and building and maintaining public works and institutions such as roads and schools. These economists argued that the movement of goods and prices would be regulated by the balance between supply and demand.

High Finance and Taxation— The Flourishing Economy of Early Modern India

Although the region prospered under the Delhi sultanate that ruled large parts of northern India for approximately four centuries prior to Mughal rule, the economy of early-modern India flourished under the Mughals. The Mughal empire was a Muslim empire founded in 1526 and eventually spanned an area that covered almost all of the Indian subcontinent by the early eighteenth century. By that time, the empire levied taxes on almost 150 million people and gained enormous wealth and power that drew the attention of Europeans. Emperor Akbar (r. 1556–1605) helped to secure this prosperity by creating a system of political, social, and economic reform that would make the Mughal empire one of the largest empires in the early-modern world. The Mughals maintained this dominant position until the death of the emperor Aurangzeb in 1707. After many political and social changes, the British East India Company began to exploit the wealth and potential of India by the latter eighteenth century.

The economy of the Mughal empire, as devised by Akbar and advanced by subsequent emperors, was highly sophisticated for the early-modern period. The land-revenue taxation system of credit and trade of commodities both internally and for foreign export made the imperial treasury, the emperor, and the imperial administration extravagantly wealthy. Flourishing in contrast to smaller empires, Mughal territory continually expanded, making more lands taxable, and thus the imperial coffers swelled. In addition, as non-Muslim peoples came under Mughal safeguard through expansion, they were taxed at a higher rate to secure Mughal military protection (although many rulers, including Akbar, abolished the tax known as *jiyza* on non-Muslims).

Wealth in the Mughal empire was concentrated in the upper echelons of Indian society. The elite included the imperial governors (*mansabdars*), the imperial administration, and, on a local level, the village tax collectors (*zamindars*), all of whom reaped vast riches in their positions. However, this concentration of wealth meant that the remaining population had little wealth,

relying upon their lands for sustenance. In addition, the Indian caste system influenced the distribution of wealth among the majority Hindu population; members of higher castes were those who held the greatest wealth, while the lower castes were the poor residents of rural villages.

The nucleus of Mughal prosperity was the land-revenue system implemented by Akbar. Imperial lands were partitioned into *jagirs* (specified allotments of land that varied in size) overseen by a *mansabdar*. The mansabdar, chosen by the emperor, was sent to govern and extract taxes from the jagirs. Agriculture was the basis of the empire's wealth, and almost all of the imperial income came from land-revenue taxation. This tax, levied at the behest of the emperor, could claim between a third and a half of each person's agricultural produce. Differing from other empires where the nobility were often excluded from taxation, the Mughal system was all inclusive except for some theologians and religious leaders, who did not pay taxes. After their deaths, however, the land reverted to being a taxable entity. The strength of this tax was that it was collected in currency rather than in produce. Thus, from peasants to nobility, the tax forced people into a fiscal economy.

The tax system was highly structured and was controlled by the central imperial administration. The mansabdars were appointed lands by the emperor himself. These lands were not in their home region, and this helped to curb the chance of abuse or exploitation. In addition, mansabdars were closely monitored by the central imperial administration, and any abuse or exploitation was heavily fined. The position of mansabdar was not paid; mansabdars were given a credit note from the emperor himself that allowed them to take 10 percent from the taxes that they collected. Additionally, the mansabdars had to fund a military band to protect the jagirs under their dominion.

In rural villages the taxes were collected by zamindars, who were the agents of the mansabdars. Zamindars, chosen from the superior ruling classes, often owed their positions to older village and religious relationships within the village unit. Their rights were superior to those of the peasants (known as *ryot* or *raiyyat*), and zamindars often held police and judicial duties.

They were hereditary possessors of a share in the village's produce from which they received an allowance (*nankar*).

The taxation system created a surplus that strengthened the economy. The surplus, primarily crops and foodstuffs, was traded on the local level. The money-driven economy also increased craft specialization (including a thriving textile industry) in urban areas, where approximately 15 percent of the Mughal population resided. Indeed, cities grew rapidly under the Mughal empire, as people were drawn by the trade and commerce that flourished in many centers. The populations of these imperial cities were some of the wealthiest members of Mughal society. Systems of credit helped traders to purchase and sell goods, and prosperity brought many luxuries to these centers. The wealth also fostered the expansion of educational and religious institutions throughout India.

The wealth created by this system also drew the interest of Europeans, as European traders, impressed by the splendor and wealth that Mughal cities exuded, quickly realized the mercantile opportunities available in India. External exports increased dramatically in the seventeenth century, especially in the trade of cotton and textiles. Rich-colored fabrics gained popularity in the West, especially in Britain. Merchants from the West began to settle at the Indian seaports, tempted by diamonds, spices, dye, silk, indigo, and especially cotton. The Dutch, followed by the Portuguese, French, and British, all formed their own East India companies. In 1627 the British East India Company built a factory at Surat, which cemented the commercial relationship.

By the middle of the eighteenth century, the Mughal empire began to change politically and socially. Excessive exploitation by the mansabdars evoked zamindars uprisings, while Maratha forces from western India attacked the Mughals on several fronts. The Battle of Plassey in 1757 brought British power and influence to the region. The British East India Company dominated Indian trade, and by the 1770s the British were firmly entrenched in the trade of commodities. The Mughal rulers retained their style and received a stipulated income, while the company ran the government and collected the taxes using the standing Indian officials. The company

was left with an excellent example of political unification as well as an economic system that efficiently taxed the greatest mass of people known to history at this time. Using these resources, the company embarked upon a policy of fiscal exploitation of India.

India's Textiles—Peasant Weaving and the Rise of Capitalism

India had historically been famous for textiles such as fine muslins, delicate silks, and rich brocades and had established a small but eager market even in the West during the early modern era. English observers reporting from India in the seventeenth century indicated that there were almost 90 different varieties of fabrics that were produced there. But India's cotton textiles generated the most significant interest. These textiles were a significant part of the caravan trade that connected the Indian commercial emporia to the markets and bazaars served by the Silk Roads (and its tributaries) that extended from China to the Mediterranean. It also dominated India's contribution to the brisk transoceanic traffic that linked Indian ports to those in the Pacific Ocean, the Arabian Sea, and the gulfs in the Middle East and the African littoral of the Indian Ocean. Prior to the Industrial Revolution in Britain, India was the premier cotton textile manufacturing country in the world. It easily dwarfed others in the quantity, quality, and value of its production and exports.

Regular trade with Europe began in the seventeenth century with the establishment of the various East India companies and picked up

➤ MERCHANTS IN EARLY MODERN INDIA

The power and wealth of merchants in early modern India were formidable. Thus, merchants such as Jagat Seth could dispatch the entire revenue from the Eastern Provinces as a *hundi* (bill of exchange) drawn on his Delhi agents; Abdul Gafur controlled a trade almost equal to that of the East India Company in the early seventeenth century; Virji Vohra was worth almost 8 million rupees; the death of Casa Verona was commemorated with a 30-gun salute; Morshet Kanji and Janoji Bhosale could raise loans worth several million rupees for the Peshwa (ruler) of Maharashtra; and firms such as those owned by Bhyaram Gopaldas and Pestonji Vicaji had offices in most large urban centers. Many merchants also served as bankers to local governors and rulers. Some merchant entrepreneurs (such as Mir Muhammad Ardestani) could diversify their interests and investments into a variety of fields. Merchants occasionally worked cooperatively to advance their collective interests, were capable of negotiating agreements with foreign business entities, could influence the appointment or dismissal of high state officials, and engaged in various building projects. The fortunes of some of these individuals or mercantile families could be compared to the Fuggers of Augsburg, the Medici of Florence, or the Cranfields of London.

—Ahrar Ahmad

dramatically thereafter. One historian has calculated that by 1614 the English had ordered 12,000 pieces of textiles, by 1664 it had increased to almost 750,000 pieces, and by 1684 it increased to more than 1.5 million pieces. The fact that the weavers were able to meet the new and increasing orders from the English, French, Portuguese, Dutch, and Danish companies while satisfying the demand of its traditional markets suggests that the amount of textiles produced in India toward the end of the seventeenth century was truly astonishing. Consequently, Indian weavers were active agents in an economic enterprise that was significant and global.

The bulk of this activity was undertaken in the rural areas, with peasant households remaining as the basic unit of production. This has led some scholars to speculate that the structure

of production remained embedded in the traditional village system and therefore had limited capitalist production and development. However, merchants were intimately involved in the cycle of production and exchange in a way that was similar to their role in the European context. This mercantile intervention was necessary to connect the local producers with the distant consumers. In addition, the complexities of textile production required the integration of various craft skills (cotton cleaners, combers, carders, twistors, winders, bleachers, dyers, printers, painters, and embroiderers) that merchants helped to coordinate. Finally, the entire system depended on the practice of providing commercial advances (*dadni*) to the household weavers (the producers). This helped poor peasants by providing guaranteed buyers at the completion of their work. It also benefited the merchants because it removed supply anxieties and allowed them to establish some demand specifications. In spite of differences in context, extent of practice, and legal implications, some of the tendencies emerging in India clearly conformed to some of the protoindustrializing patterns demonstrated in Europe at the time.

This textile system was also consistent with the increasing monetization of the Indian economy. Under the Mughals a standardized trimetallic currency gradually came into existence, and imperial coins became ubiquitous. Moreover, creative credit and financial arrangements such as the use of *hundis* (i.e., promissory notes, bills of exchange, commercial paper) also developed and were extensively used to settle various economic transactions. The system was lubricated with the skills and resources of professional money changers (*sarrafs* or *shroffs*), who also issued and discounted hundis and provided rudimentary banking and insurance services.

Another aspect of the development of early capitalism is the evidence that some merchants increasingly treated the peasant manufacturers as wage labor rather than traditional price workers. In many large cities *karkhanas* (manufactories) were also being established where this transition in production relations was more obvious. However, it would be an overstatement to suggest that India's textile workers were poised on the brink of a capitalist revolution. Unfortunately, as

British colonial rule incorporated India into the international capitalist system, we will not know if India would have become an industrial power as an independent nation.

Economic Growth in Tokugawa Japan

Although the Tokugawa shogunate followed a century of warfare, it started off on surprisingly sound economic footing. Peace and stability under unified Tokugawa rule allowed dynamic economic growth based on both agricultural production and commercial revolution. Throughout the seventeenth century the population grew, which resulted in greater consumer demand. It is estimated that by 1700 the population of Edo (now Tokyo), Japan's largest city, was over 1 million, while Osaka's and Kyoto's populations numbered about 400,000 each. This occurred essentially without foreign markets because after the *sakoku*, or "closed country" edicts, of the 1630s, the volume of trade declined, and exports consisted primarily of metal bullion.

Agriculture was the backbone of economic growth, with an economy based on rice. Social position within the warrior class was delineated through stipends of rice based on a measurement called the *koku*, which measures about five

bushels. To be a daimyo (literally a “great name,” or one of Japan’s approximately 260 territorial lords), one had to control lands that produced 10,000 or more koku per year. It was therefore in the interest of both the daimyo and the individual farmers to increase agricultural production. With unification and the removal of barriers at domainal borders, knowledge of improved technology such as tools, better strains of rice, and fertilizers began to spread more quickly and easily around the country. The rice-based economy stimulated land reclamation, increasing the acreage under cultivation. Irrigation techniques were refined and improved. Peace and better production also increased leisure time, which generated a better-educated literate group of cultivators so that farming information in printed form, often the result of scientific experimentation, circulated. As a result, agrarian production doubled within the first century of the Tokugawa shogunate. Wealthy farmers emerged who had tenants and employed hired laborers. Despite three major famines during 1732–1733, 1783–1787, and 1832–1836 and around 20 smaller ones, agricultural production increased overall throughout the Tokugawa period.

Control of foreign trade was one way that the shogunate sought to prevent the daimyo from acquiring wealth. Such control did, however, generally profit the shogunate and serve as a valuable link to the outside world. Some shogunal policies with entirely divergent purposes also encouraged economic growth. The system of alternate attendance, the requirement that daimyo spend part of the year in their home domain and part with their wives and children who were hostages in Edo, was similarly supposed to prevent accumulation of wealth by daimyo. However, this forced the daimyo to obtain cash for travel. It encouraged the construction of roads, bridges, and other aids to travel, including towns where the large retinues would stay. Ultimately the travel of these retinues across the country was responsible for maintaining a unified nation with an integrated economy rather than the small economically independent states from the quasi-feudal union of vassal states.

Because the economy was based on agriculture, most economic policy was directed at these activities. Merchants, at the bottom of the

Confucian social scale, could be victimized by arbitrary measures such as forced loans or debt cancellation. On the other hand, mercantile activities were taxed much less heavily than agriculture. This encouraged commercial growth and increased urbanization. The fact that buildings in Japanese cities were constructed with wood also kept the economy booming. Every time a fire devastated a city, there was a flurry of reconstruction that kept craftsmen and raw materials suppliers such as lumber yards in business.

In the early years of the shogunate, commercial growth was in the hands of those with warrants from the shogun or daimyo. Monopolies were formed from which fees were extracted. In 1721 this became a licensing process for commercial groups. In the eighteenth century the pace of growth had slowed, but great fortunes were made through more diversified activities such as money lending. By the mid-eighteenth century, the economy was almost completely cash-based. Rice was exchanged for gold, silver, and copper. Paper money such as silver or rice certificates was used within some domains, and money orders were issued between merchants to facilitate intercity trade. Some of the large dry goods stores even began establishing fixed prices in all their branches.

Signs of protoindustrialization appeared by the beginning of the nineteenth century. These

➤ OSAKA, “THE KITCHEN OF JAPAN”

Located near a good harbor at the center of Japan, Osaka was historically a cultural and commercial center. The modern city began to flourish when Toyotomi Hideyoshi (ca. 1536–1598) ordered construction of Osaka Castle in 1583. His efforts were followed by merchants and craftsmen who in turn required religious institutions to serve their spiritual needs, all of whom were encouraged by Hideyoshi. Although Osaka floundered under Tokugawa assaults in 1614 and 1615, the population rebounded quickly. Markets for fruit and vegetables, fresh and dried fish, and fertilizer were established because of the size of the population. In addition, its proximity to other markets and easy access to rivers and the ocean allowed transport of goods to and from the city. The exchange of rice for cash had been common since the construction of the castle, and an exchange was officially founded in Dojima in 1688. This became perhaps the world’s first futures market (a market where contracts for delivery of commodities on specific future dates are auctioned to speculators). Most foreign goods passed through the hands of Osaka merchants, and a huge variety of products was produced there. Because of the commercial and financial centers in Osaka, warehouses and merchant guilds that brokered trade among all the regions of Japan were headquartered there. Osaka became known as “the kitchen of Japan” because most commodities passed through it at some time or another.

—Martha Chaiklin

included production for distant markets, complex divisions of labor, cottage industries, and technological improvements as well as mass production of staples such as lamp and cooking oil, soy sauce, sake, and miso (fermented bean paste). Cash crops such as silk, tobacco, tea, and indigo increased. Supplementary produce such as paper, dried fish, seaweed, and silk expanded and diversified by region. Daimyo encouraged and often monopolized these by-industries to improve their own finances. Luxury items increased, with more varieties of food products, restaurants, bars, and entertainment. In addition, the clothing and housing had improved, and increased leisure time had allowed for better

education. The advanced financial and protoindustrial practices of the Edo period paved the way for an astoundingly rapid transition to a modern economy.

Venetian Shipyards

Venetian shipyards, most notably the Venetian Arsenal, were famous during the Middle Ages, the Renaissance, and the early modern era for their efficiency and great capacity to produce ships and everything connected with them. For modern historians, the Venetian Arsenal is considered a forerunner to the factories of the Industrial Revolution. In many ways the arsenal operated along the same lines as a factory. Venetians took pride in their arsenal, and it was one of the expected stops for European tourists.

The Venetian Arsenal was founded around 1104, although a private shipyard had probably existed on that location since the eighth century. Located in the Castello sestiere, the arsenal occupied around 60 acres (24 hectares). Eventually it was surrounded by 2.5 miles of walls (4 kilometers) and moats to protect it. The source of the name “Arsenal” is disputed. Some authorities believe that it came from “Arx Senatus,” or “fortress of the Senate.” Others believe that it came from the Arabic “Dar al Sina’a,” or “dockyard.” The concept was based on the Byzantine model. Unlike the private shipyards, the arsenal was a public institution, with the employees and materials provided by the state to ensure that the ships necessary to Venice’s survival and prosperity were available.

Originally the Venetian Arsenal was intended to maintain and repair privately built ships. Private builders were able to supply the

fleet necessary to protect Venice's commercial interests in the Mediterranean and the Black Sea. In 1172, for example, 100 galleys were built in only four months. Over the next few decades Venetian shipbuilders produced similar-sized fleets in short periods. The Venetian government recognized that the state's power depended upon its skilled craftsmen. The government passed legislation to prevent the craftsmen from emigrating in 1227. Experience quickly taught them that private builders could not afford to keep skilled workers busy all the time. In 1302 the Senate ordered that all state war galleys be built in the arsenal. The existing compound was too small, so in 1320 it was expanded. The Arsenal Nuovo was built at state expense and was large enough to build and maintain the entire fleet as well as store the galleys that were not needed at the time. Larger merchant ships were also built in the Arsenal.

The state provided apprenticeships for talented young men. It also guaranteed an income for skilled craftsmen. Even when the men were too old or sick to work, they received a day's pay as long as they appeared in the Venetian Arsenal. At its peak the Venetian Arsenal employed 16,000 men and women. Most were unskilled workers who provided muscle power to move material and finished products. All workers received such benefits as free wine and holidays. Most workers lived in housing within easy walking distance of the arsenal. The work at the arsenal required greater discipline than was usual during the Middle Ages.

The Venetian Arsenal developed methods of mass-producing galleys and sailing ships. The workers used the frame-first method instead of the traditional hull-first system. Wooden pieces were shaped and seasoned according to a standard pattern. They were then assembled to form a skeleton for a ship. The planks that made up the hull were then attached. Workers at the arsenal could assemble one galley each day when needed. Locals told tourists about a famous incident from 1574, when French king Henry III visited Venice. At the beginning of a state dinner, workers started to assemble a galley; when Henry finished eating, the galley was finished.

The Venetian Arsenal had three separate manufacturing centers. The most important

Building a galley in a Venice shipyard, woodcut by Bernhard Breidenbach from Peregrinatio in Terram Sanctam, fifteenth century. (Erich Lessing/Art Resource, NY)

was the shipbuilding area, charged with building, outfitting, and repairing ships. The second was a factory for making rope and cables. The ropes were needed for outfitting the ships. The third was a center for making gunpowder and casting cannons. The earliest bombards were cast in the arsenal during the 1370s and were soon placed on galleys for use against other ships and land targets. The skilled workers in the munitions factories also developed improved firearms. Handguns manufactured by the arsenal were made to have a higher muzzle velocity than usual to better penetrate armor. The arsenal also produced lighter cannons. The Venetian mercenary Bartolomeo Colleoni mounted some of these cannons on lightweight carriages to produce some of the first cannons suitable for field use.

Between the fourteenth and eighteenth centuries the Venetian Arsenal was considered a marvel for most Europeans. Tourists were shown the grounds, with its large amounts of materials and works in progress. Weapons and equipment for fighting men were stored for later use along with ships and galleys. The arsenal was largely destroyed during Napoleon's rule, but it remains an Italian naval base today.

The European Commercial Revolution

The European Commercial Revolution, lasting from approximately 1500 to 1700, was characterized by economic expansion due to Europe's increased linkages with the New World across the Atlantic and growing ties with the Baltic East. The growing economic system of mercantilism, an economic system that advocated that governments regulate manufacturing, trade, and commercial expansion, encouraged the industries of many European states to develop and grow dramatically, taking advantage of the influx of specie—gold and silver coins—coming in from the New World. The discovery of the New World as well as growing trade with the Far East allowed Europeans to create a vast international network of banking, investment, and commercial ties. The growth of the Atlantic trade network saw the rise in economic and political importance of countries such as England, the Netherlands, and Spain but resulted in the relative decline of the Mediterranean-based system and inland commercial centers such as the Hanseatic League and the Venetian Empire.

The economic development of the Low Countries and England was contingent on opening markets made possible not only by the New World but also within Europe itself. Decades of constant warfare disrupted the economic primacy of France and the Habsburg-dominated Holy Roman Empire on the continent and allowed new economic powerhouses on the fringes to take over their markets. The creation of the new seafaring maritime economic powers of Spain and Portugal led to the decline of the Mediterranean trade routes and to the waning economic strength of the Italian city-states as well as their access to trade routes to the Far East through the Ottoman empire. With the exception of Genoa, most of the Italian city-states that had formerly been vibrant centers of European trade declined in relation to the Atlantic powers. Genoa adapted itself to the situation by creating a substantial banking network that encompassed the Spanish domains in Europe and the Americas.

The voyages of discovery not only expanded European colonization abroad, creating the potential for new markets, but also tapped virgin sources of raw materials, particularly silver.

▶ EUROPEAN INFLATION—CONSEQUENCES OF THE COMMERCIAL REVOLUTION

From the fifteenth through the seventeenth centuries a massive influx of Aztec gold and Peruvian silver saturated the Old World economy, creating spectacular wealth for some but ultimately destabilizing and transforming the economic foundation of Europe. Historians believe that New World goods and foods contributed to an improved standard of living in various European countries but also note that soaring inflation accompanied these improvements and plagued European society as a result. In perhaps the most striking example, the exorbitant amount of taxes extracted from Castilian gentry to feed the coffers of the Spanish king to fight wars against the Turks in the Mediterranean and the Protestants in Germany ruined the local economies of the Iberian Peninsula. In what historians call the price revolution prices rose at a relatively slow rate of about 1 percent per year on average in Europe, but in

general prices continued to rise for more than a century, having a severe impact on interest rates and rents. This contributed to a growing social and economic inequality.

Those areas that benefited from the Commercial Revolution, such as England and the Netherlands, saw an increase in their power that accompanied the decline of Spain and Portugal. These former economic powers failed to invest in their domestic industries and relied primarily on the exploitation of their foreign dependencies. England and the Netherlands, in addition to France, developed their own commercial ties with the Spanish and Portuguese dominions to supply them with goods. Spain and Portugal, while capable of maintaining their far-flung imperial possessions, were supplanted in terms of economic might by England, France, and the Netherlands.

—Abraham O. Mendoza

American silver provided Spain with plenty of specie to spend on its European wars against either the Ottoman Turks or Protestants, expanding the supply of money readily available to Europe. This created vast new money markets and banking networks that readily invested in the new commercial centers in England, France, and the Low Countries. This also led to the overwhelming growth of commercial networks through banks and insurance firms and to innovative methods of monetary exchanges such as bills of credit, all contributing to the growing modernization of the Western economy. While one major side effect of this process was the rampant inflation of the sixteenth century, such economic fluctuations benefited the merchant and banking classes then thriving. The development of joint-stock companies, such as the British East India Company and the Dutch West Indies Company, allowed companies of merchants to invest in colonial enterprises and trade networks fairly autonomously from centralized government interference. Joint-stock companies differed from mercantilist endeavors, which were headed by the state. The state also sponsored vast economic enterprises through such centralized investments in colonies, trade corporations, and fleets.

This period was characterized by the accumulation and loss of vast amounts of wealth. Spain accumulated massive amounts of gold and silver through its exploitation of the New World in addition to holding the crown of Portugal from 1580 to 1640. The wars of Philip II against the United Provinces (Netherlands) and his attempts to stamp out Protestantism depleted his sizable amount of specie. Portugal explored South America, Africa, India, and Southeast Asia, creating a substantial trade network that became the Portuguese Empire. The Dutch and the English also traveled to the New World, particularly North America, developing substantial colonies. The French subsequently followed and settled Quebec in 1608. However, they did not create settlement colonies in the same way as the English but instead set up primarily royal colonies.

Economic relationships between western and eastern Europe also changed dramatically during this period. Growing specialization in various trades and industries in the Atlantic

world created increased dependence on Baltic grain. In exchange for finished goods made in England, France, or the Netherlands, the eastern European countries of Muscovy (Russia), Poland, and Prussia traded grain. This aspect of the commercial revolution fostered a paradoxical effect on both merchant elites and the institution of serfdom. While serfdom ebbed away in western Europe, creating a vast independent peasantry, the bonds between lords and serfs were strengthened in the East to better put more lands into cultivation to take advantage of this new economic relationship with the West. As the eastern Slavic kingdoms managed to create their own direct linkages with western Europe through the Baltic Sea, they found less of a need to depend on the middlemen of the Hanseatic League in Germany, which declined substantially during this period.

Mercantilism and Colbertism— Ideas and Practice

The term “mercantilism” was coined in the eighteenth century and referred to an economic policy in which a state exported more local goods and imported less foreign goods. Mercantilism was formally practiced in Europe during the sixteenth century but reached its height during the seventeenth century. It was a policy of aggressive economic nationalism initially based on bullion (silver and gold) and specie (coined money) and later on trade goods. It promoted self-sufficiency and a favorable balance of trade and increased the wealth of both the sovereign and the state. Mercantilist thought focused not only on creating a favorable balance of trade but also on wages, employment, domestic resources, and the standard of living. The loose ad hoc program was often criticized for its calculated analysis of social issues and of attempting to reduce humanity to mere economic statistics.

In practice, the government of each mercantilist nation was involved in regulating and

➤ BERNARD DE MANDEVILLE, *THE FABLE OF THE BEES*

The Fable of the Bees is one of the most important works of English satire produced during the eighteenth century. The poem was composed by Bernard de Mandeville (1670–1733), a native of Rotterdam who rose to prominence as a successful physician in London. Although denounced for its apparent encouragement of vice as the mainstay of the mercantile system, it was widely popular for its biting social and institutional criticisms.

Originally titled *The Grumbling Hive: or, Knaves Turn'd Honest*, the work first appeared in a pamphlet in 1705. The poem described a balanced society grounded in the vices of mankind. Pickpockets, lawyers, physicians, priests, soldiers, kings, and even Justice herself had been corrupted by greed and self-interest, yet all were essential in maintaining the flourishing society. Once the hive became virtuous, trade and industry ceased to be productive. Mandeville intimated that the mercantile system was based on vice, luxury, and greed. Immorality resulted in prosperity.

Mandeville reissued the poem in 1714 under a new title, *The Fable of the Bees: or Private Vices, Public Benefits*. The final edition was published in 1724. *The Fable of the Bees* became the focus of fierce attacks from the church, the courts, and the press but was wildly popular both in England and Europe.

—Breanna S. Griego

directing the economy. Mercantilism led to many wars in the early modern period as nations tried to capture available markets, particularly in the colonial sphere. The development of the mercantile system coincided with the emergence of European nation-states, particularly with Spain's acquisition of New World gold and silver. Spain and Portugal exercised a severe mercantile policy, especially in their colonial investments.

Among those nations that adopted the program, the Dutch posed a threat to the economic vitality of England and France. They were the dominant maritime force of the seventeenth century, and their cargo ships were among the swiftest vessels of the period. The competition inherent in the mercantilist doctrine made each

nation particularly sensitive to the strengths and weaknesses of their rivals. In England the Navigation Acts of 1651 put severe restrictions on imports. Many people became smugglers, pirates, and privateers to avoid the monopolies that limited the free trade of items such as indigo, tobacco, and slaves.

Private consumers and wage earners were weakened under the mercantile system. They were forbidden to ask for higher wages and were prevented from consuming potential exports. But business continued to boom, and new public institutions appeared. The Bank of Amsterdam opened for business in 1609, preceded only by the Bank of Venice. The Bank of England opened nearly 100 years later in 1694. Trading institutions, such as the Dutch and English East India companies, further increased the state's involvement in all aspects of trade and shipbuilding.

Mercantilist ideas were in decline when Adam Smith published the *Inquiry into the Nature and Causes of the Wealth of Nations* (1776). Laissez-faire, the idea of unrestricted trade, challenged the theory of mercantilism. The individual, not the state, drove the economy. The consumer, not the producer, should benefit in Smith's conception of preindustrial capitalism. David Ricardo, Thomas Robert Malthus, and John Stuart Mill relied on mercantilist theory to explain the discrepancy between population, wages, and rent.

Jean-Baptiste Colbert wanted France to achieve prosperity like the Netherlands. He adopted aggressive mercantile policies that became known as Colbertism. Colbert created the financial base that Louis XIV needed to fund his wars and used state-sponsored institutions to regulate trade, simplified administrative bureaucracy, and established a system of roads and canals to improve inland communication. Colbert was determined to enrich his country via commerce and envisioned France as the greatest of western European nations.

In order to make French exports more desirable, Colbert initiated laws that fixed the quality and measure of each article. Inadequate goods were destroyed, and idle and inefficient workers were punished. Colbert, in his attempt to strictly control production and commerce, increased state supervision to such an extreme that improvements were resisted. The workers

found themselves unable to advance within the domain of regulated production. The work year was also increased to 14 months, but the workers received the salary of a 12-month work year.

Colbert was willing to improve the greatness of France at the expense of the workers as well as at the expense of England and the Dutch Republic. He convinced Louis XIV to go to war with Holland in 1672 to promote economic imperialism. The minister of finance developed the French navy in order to protect newly acquired colonies in North America. He kept talented Frenchmen within the kingdom by forbidding them, under pain of death, to serve foreigners.

Colbert was also a patron of the arts and literature. He founded the Academy of Sciences and brought the French Academy, the Academy of Inscriptions and Medals, and the Academies of Architecture, Music, and Painting under the jurisdiction of the state. The fact that he

personally enjoyed the arts was secondary to the fact that he directed all forms of production and expression to enhance the greatness of the kingdom. The term “Colbertism” came to be associated with the most extreme state control of production and commerce as well as the manipulation of the arts to serve as propaganda for the state. Colbert’s plan was bound to collapse in on itself due to its narrow and rigid regulations that did not allow for creativity or invention.

The Latin American Price Revolution

The Price Revolution was a long period in which average prices rose throughout Europe and eventually around the world. This period of inflation owes its initial origins to the rise in population during the late fifteenth century as Europe recovered from the Black Death. During the 1470s new mining techniques that increased the output of silver combined with the opening of the Portuguese gold trade with West Africa to accelerate inflation by increasing the amount of precious metals in circulation. The effects of the Price Revolution were further spurred by the influx of silver from Spanish Mexico and Peru from the 1540s on.

Silver poured into Spain on galleons from the New World, especially from the 1560s onward, when use of mercury to extract silver from ores became prevalent. Silver shipments peaked in the 1590s at an average of 2 million ducats a year. Mexican silver helped finance the European trade with China via Manila and

➤ MEXICAN GOLD AND PERUVIAN SILVER

Spain developed two sources of silver in the New World: Peru and New Spain (Mexico). The Peruvian mines centered on Cerro Rico de Potosí in what is now Bolivia. At its peak, Potosí had a population of nearly 100,000. Some 13,000 Native American laborers each year, obtained under the *mita*, or system of forced labor, fed the mines. In Mexico the chief mining areas, such as Zacatecas, were to the north of the original Aztec empire. The Spaniards brought in Native Americans from other parts of New Spain and also brought in African slaves. Because these workers did not return to their homelands unlike Peruvian laborers, they quickly became Hispanicized.

Silver mined from Potosí was shipped north to Cartagena and then was taken by galleons to rendezvous with ships bearing the Mexican silver from Veracruz in the annual *flota* that carried the treasure to Spain. This colossal flow of treasure was a standing temptation to pirates and led English, French, and Dutch buccaneers to seize footholds in the Caribbean. Piracy sped the flow of

bullion into the world economy, as in 1628 when the Dutch seized the entire annual Spanish treasure fleet off Cuba.

—Timothy Neeno

Macao. Unfortunately, Spain's rulers, especially Philip II, channeled the initial influx of silver to finance their wars, spending currency faster than it came in. During 1566–1654 Spain squandered 218 million ducats on the war with the Dutch alone while taking in just 121 million ducats in New World specie. By 1575 Spanish silver coins, called pieces of eight, were in circulation throughout the continent. The Crown tried to horde the specie, taking the royal fifth of all silver produced, but smuggling, ongoing wars, and the country's need for imports as inflation eroded Spain's economy gradually disseminated the silver. Eventually the silver sped up a ruinous process of inflation that, abetted by wars and financial mismanagement, wiped out the Spanish middle class.

During the first period of European price increases, as silver became more plentiful and the money supply expanded, inflation soared to historic highs: 300 percent in England by 1650, for example. In France, by the end of the sixteenth century prices had increased more than 600 percent since the 1470s. Wages, however, lagged,

and many peasants found their standard of living declining. This led to increasing rural unrest, particularly in Germany and France. Merchants and craftsmen, on the other hand, generally flourished as the commercial climate became more active and the circulation of specie connected local economies. By the fifteenth century price increases in the Russian economy matched those in Europe. The same was true for the Ottoman Empire, New Spain, and Brazil and, with a 20-year lag, India. The Turkish silver *asper*, with which Turkey's elite *janissary* corps was paid, lost more than half its value versus gold between the 1530s and 1615. The Mogul empire, in contrast, benefited, as silver from the spice trade fed India's economy. Even in China where gold was in less demand, silver tended to drive prices up.

After 1603 silver shipments from the New World lessened due to a scarcity of mercury to process the ore, while deeper mining required heavier investments of capital. After 1693 there was a new wave of shipments of precious metals from the New World when the Portuguese began developing the gold mines of Goiás and

Minas Gerais in Brazil. Around 1700 Mexican silver production increased again, using skilled labor and fresh capital raised in Mexico City. The influx led to a second round of price increases in Europe beginning around 1729. Throughout the entire period of 1450–1770, price rises were abetted by population increase, a gradual expansion of credit, and an increased velocity of circulation of money as commercial life flourished. The Brazilian gold mining boom from 1693 to the 1730s kept the declining Portuguese realm afloat, while at the same time most of the gold ended up going to Great Britain, which by this time dominated Portugal's trade. But by the 1730s the Brazilian mines were played out, and by the 1770s Mexican silver production fell off again.

The great influx of silver and gold from the New World was not the sole cause of the Price Revolution, but it greatly increased the pace of the globalization of the world economy. Inflation shook up the old landed social order and speeded the shift in power to commercially oriented nation-states. Finally, the increased importance of bullion gave a stimulus to iconoclastic Protestantism and to the new economic philosophy of mercantilism.

Customs Collection in Revolutionary America

The English settlement of North America was an extension of mercantilist thought. Various political theorists argued that there was a fixed amount of wealth in the world and that a nation's wealth could only be augmented through

closed trade with its colonies. Britain imposed the Navigation Acts to monopolize trade with the empire.

To ensure adherence to the acts, the British government posted an array of customs officials at the major ports in the 13 mainland colonies. Examining the vessels and cargoes engaged in overseas trade in the colonies, these officers were charged with preventing colonial merchants from ignoring the acts. Exploiting the enormous coastline by illegally landing goods and paying handsome bribes to various customs officers, colonial merchants were usually able to evade the acts without much trouble for most of the 1700s. This was very apparent when Britain passed the Molasses Act (1733), which imposed higher duties on all foreign molasses imported into the 13 colonies. Most colonial merchants openly evaded the taxes, continuing their smuggling operations. Down to 1763, lax enforcement in the colonies and widespread networks for smuggling rendered customs collection in the colonies an almost impossible feat.

The Seven Years' War (1756–1763) brought about a marked change in the British system of customs collection in the colonies. Widespread evidence of colonial trade with the French enemy, the need to station troops in the colonies in peacetime, and a ballooning of Britain's national

THE NAVIGATION ACTS

The Navigation Acts were a series of laws passed between 1651 and 1696. The acts established that trade between Britain and its colonies must be conducted on British or colonial vessels, with crews living in the empire. Colonial manufacturing would be restricted by the imposition of tariffs in the colonies, and certain colonial-grown commodities, like sugar and tobacco, could only be exported to Britain. Subsequent amendments loosened the restrictions on enumerated commodities, allowing some to be shipped to other markets in Europe. To ensure adherence to the acts, an array of customs officials were posted in several ports to examine the entry and clearance of vessels.

—Joseph Avitable

debt forced imperial policy makers to address the issue of customs evasion in the colonies. By instituting a rigid system of customs collection in the 13 colonies, British policy makers hoped to undermine the colonial trade with the French West Indies and raise revenue in the Americas to defray escalating military expenditures.

The Sugar Act (1764) was the first measure adopted to accomplish these two aims. By lowering the duty on sugar and molasses imported from foreign plantations, the British government hoped that incentives to smuggle would be lowered and that more colonial merchants would actually pay the import taxes on these goods. The Revenue Act (1766) further lowered import duties on these commodities but extended their collection to sugar and molasses imported into the colonies from all West Indian plantations. The Townshend Acts (1767) imposed a range of duties on manufactured goods and tea imported into the colonies. To ensure the proper collection of duties on these commodities, Britain increased the number of customs staff operating in the 13 colonies as well as their oversight. Finally, institutional changes were implemented, such as the creation of new courts charged with undermining smuggling and the stationing of naval vessels to patrol colonial waters, to further increase revenues collected in the colonies.

In the end, the customs reforms instituted after 1763 failed in their intentions. First, the British never devoted sufficient machinery to carry out their intentions in the colonies. The geographic size of the 13 colonies and the desire to save money by employing only a skeleton customs administration rendered efficient customs collection impossible. Furthermore, after the Seven Years' War, British needs to raise money ran into a solidifying colonial opposition, one that would lead to the American Revolution.

Indentured Servitude in the Atlantic Economy

Indentured servitude came to British America with the establishment of the first settlement at Jamestown in 1607 and became prominent throughout much of the British dominions throughout the colonial period. Historians estimate that from 1630 to 1776 one-half to two-thirds of all immigrants to British America were indentured. Labor recruiters in England, Ireland, the Netherlands, and the German states actively recruited bondsmen, mostly men, for service in the Americas on contracts extending between three to seven years in exchange for travel fare and the promise of room and board and possibly land at the termination of the contract. Many of these indentured servants ended up working in dire conditions on cash crop plantations (i.e., tobacco, cotton, and sugar), and the lucky ones were employed in skilled trades, such as blacksmithing and construction. While France and the Netherlands also contracted indentured servants, it was on a significantly smaller scale than that of the English.

The Virginia Company's investors faced a critical situation in recruiting and maintaining a labor force in Jamestown suitable for working in a tobacco plantation. Consequently they developed an American system of indentured servitude based on existing contractual labor practices in England and appropriating the model of servants in husbandry, in which bondsmen worked and lived in the household of their masters by contract, typically on an annual basis. Because high transportation costs proved an obstacle for the average English laborers or tradesmen wishing to settle overseas, the company decided to use its own financial resources to subsidize passage for interested individuals in exchange for several years of labor, similar to the contractual conditions of the servants in the husbandry system. Contracted servants were expected to repay the company out of their earnings and by remaining with a master for the demarcated period, with the understanding that their master would provide food, shelter, and other commodities necessary for sustenance. Initially the contracts were written through the company itself, with the contractual

commitment owed directly to the company and its agents. As the practice expanded, indentured servants worked with specific individuals in different occupations across British North America in both the mercantile northern colonies and the agricultural cash crop southern and Caribbean colonies. Other joint-stock charter companies followed in the practice of this model to recruit laborers for their own American enterprises.

From the 1630s to the 1770s the institution of indentured servitude expanded to include not only bondsmen from England but also from elsewhere in the British Isles (Ireland and Scotland) and on the continent (the Netherlands, Germany, France, etc.) as well as in Africa. African indentured servants and slaves as well as English convict labor held a common lot with many white indentured servants in the Americas, sharing quarters, food, and labor with them and also enduring similar abuses from their overseers and oppressive working conditions. Furthermore, runaways and rebellious or indolent servants were subject to floggings, beatings, and other violent punishments, much like slaves. At times indentured servants were treated like chattel slaves, as they were given the bare minimum of food and clothing and had their contracts extended for minor infractions, such as breaking a dish. Nonetheless, violent abuse and the murder of indentured servants were illegal throughout much of British America, whereas the murder and severe abuse of slaves was slightly more tolerable. Moreover, indentured servants did attain a level of rights in the various colonies as these newly established colonial governments codified legal codes provisioning them with such. Former indentured servants were guaranteed the full rights of citizens upon the completion of their contractual obligations to their owner and were entitled to receive land and/or money if that was stipulated in said contract. Such rights had been originally agreed to by the company Assembly but eventually extended to the legal codes of the individual American colonial governments, which all had large numbers of indentured servants.

The destination of certain national groups also determined their treatment and condition as indentured servants in British America. Large numbers of German indentured servants were

> INDENTURED SERVANTS IN BACON'S REBELLION

Bacon's Rebellion, led by Nathaniel Bacon in 1676, was a large-scale revolt against the tidewater gentry who dominated the British American colony of Virginia. Frontiersmen, small farmers, small tradesmen, and especially indentured servants were subject to the overwhelming control of this planter aristocracy, whose interests were highly overrepresented in the legislature and in the central government under Governor William Berkeley. In response to a large-scale attack by local indigenous American tribes during 1675–1676, western settlers, many of them former indentured servants, demanded action by the central colonial government under Governor Berkeley. Berkeley refused to send troops, and this resulted in immediate rebellion. The rebellion was eventually quashed by the colonial government's forces, but the situation proved to the planters that indentured servants could be quite quarrelsome. Bacon's Rebellion marked a change, as planters began to import larger numbers of chattel African slaves, who were perceived as more amenable than unruly whites (and who would not expect land grants or have limited years on contract). New laws made slavery a lifelong status, passed on to one's children, thereby creating a racial hierarchy with African slaves at the bottom of Virginia society.

—Abraham O. Mendoza

settled in Pennsylvania, a colony established by William Penn. English Puritan indentured servants typically settled in the Massachusetts Bay Colony and in Greater New England. Irish indentured servants, who began arriving in droves in the late seventeenth and early eighteenth centuries, were spread far and wide between the Tidewater Atlantic southern colonies and in the Caribbean colonies as far as Barbados. Ethnic tensions between the English descended landowners and their Irish indentured servants could typically result in conflict, given the history of conflict between England and Ireland due to English colonization and religious intolerance in Ireland. In certain episodes, such as the Seven Years' War (1756–1763), the Irish openly rebelled against their English masters in league with their fellow French Catholic allies. While German,

Scottish, and English indentured servants did indeed receive their share of abuse under bondage, the Irish suffered far worse under British tutelage.

The tasks that indentured servants were required to complete ranged from the backbreaking labor of the sugar plantation to the more comfortable setting of the overseer of the day-to-day operations of a business concern. Indentured servitude was most important in the early decades of colonies that produced cash crops for export. Demand for these products led planters to contract large numbers of servants for the cultivation, harvest, and production of these crops, which in turn necessitated the contracting of skilled workers to build housing and facilities, provide transport, and perform different forms of specialized manufacturing (i.e., blacksmiths, coopers, and tailors). In the late seventeenth and early eighteenth centuries as working conditions worsened in places like Barbados and the Tidewater Atlantic colonies, characterized by their reliance on plantation economies, white indentured servants found those less desirable for settlement.

High numbers of indentured servants immigrated to the northern colonies, which offered diversified agricultural practices, throughout the colonial period. In the southern colonies and the Caribbean, however, with the rise of plantations, indentured servitude fell dramatically as the costs of servitude rose, and planters imported African chattel slaves. Furthermore, as economic conditions in the colonies improved, more free settlers were drawn to settle there. With the spread of Enlightenment ideals of human freedoms and natural law across the Atlantic, many elites and common folk began to see the institution of indentured servitude as backward and unbecoming, at least for white people. After the American Revolution and the establishment of the United States, the institution of indentured servitude ebbed into insignificance, remaining well into the middle of the nineteenth century in very small numbers. In contrast, with the end of the slave trade throughout the British Empire in 1806, indentured servitude remained vital to the plantation economies of the British Caribbean.

The Consumer Revolution in British North America

The consumer revolution refers to a period in colonial American history when people throughout the colonies radically increased their purchase (and consumption) of British imports. The birth of this consumer society reflected both the growth of a mercantilist class along the East Coast and the increasing availability of consumer goods. Although regularly associated with northern seaport towns, this consumer revolution extended to the southern colonies, frontier areas, rural hinterlands, and even military posts. Despite the romanticized idea of the self-sufficient colonial farmer, stores and peddlers incorporated rural dwellers into this economic revolution just as they did urban elites. This consumption followed an almost syllogistic pattern: rural consumers upheld urban colonists as their model for consumption, just as urban colonists based their consumption patterns on British ideals.

Current research dates the consumer revolution in British North America to the 1740s and 1750s. Yet the seeds of this consumptive ethic were planted during the late 1600s, when colonists began to acquire wealth and leisure time. Consumption increased dramatically during the mid-1700s because colonists could finally afford to purchase coveted British goods. The extent of this revolution is largely unquantifiable (e.g., how many rural dwellers adopted a consumptive lifestyle versus how many persisted in their use of locally produced goods), but this focus on material culture undoubtedly reflected a near-universal desire to imitate the tastes and lifestyle of contemporary English society. People living in New England, Georgia, Virginia, and the interior may have displayed distinct regional

cultures at this time, but they participated in the same transatlantic consumer culture and thus generally purchased the same wares. By the mid-eighteenth century, travelers could find exotic and luxury consumer goods in the most rustic of rural dwellings. Painted mirrors, furniture pieces, pewter serving pieces, tea services, European wines, ceramic dishes, silk cloth, brass pieces, ornamented combs, and colorful ribbons found their way into crude cabins and plantations alike. The greater part of these goods possessed little utilitarian value; rather, colonists purchased them for their aesthetic appeal.

Not all colonists embraced this new ethic of consumption. Ministers, fearing a decline of religious fortitude, worked (ineffectively) to loosen the hold of materialism on colonial peoples. In sermons, pamphlets, and individual exhortations, they pointed to the fate of other peoples—such as the Romans—who became dependent on or enamored with worldly goods. From a biblical perspective, misplaced trust in physical wealth encouraged idleness and pride. From a social perspective, wealthy colonists at times disapproved of this broadening marketplace because it eroded social deference by affording socially inferior persons the chance to purchase goods that historically denoted status or power. Elites insisted that innate civility and etiquette were as important as clothing and property in determining status, and these items, unlike their more tangible counterparts, could never be purchased. Thus, the elite used the ethic of consumption to justify a social hierarchy: those born below the upper echelon of society should accept their

lot, live prudently, and purchase practical items (wooden spoons, woolen cloth, etc.) rather than ornamental items. Finally, more attentive colonists warned of the economic consequences of this consumer culture. Colonists usually financed their consumption with tobacco exports, but importation almost always exceeded exportation. This imbalance in trade simultaneously perpetuated a cycle of debt and undermined the livelihoods of regional or local producers.

In the years leading up to the American Revolutionary War, the various forms of opposition bound together in a unique form of protest. Since consumer goods afforded colonists their identity as British subjects, rejecting those same goods through nonimportation and nonconsumption became an act of patriotism and virtue. This ethic of nonconsumption, though a challenge to the lifestyle of nearly all colonists, became an ideology that patriots, ministers, landowners, and farmers could all support.

■ Introduction: Fashioning Global Organizations

The advent of European exploration and global contact also initiated the beginnings of a global market. Economics are what drove the Portuguese, Spanish, French, English, and Dutch to brave the ocean waters in search of new lands. Spices and other luxuries from Asia had slowly made their way into Europe via the Silk Roads prior to the fifteenth cen-

tury, but the long and dangerous journey had made the products extremely rare and expensive. The opening up of the oceans provided economic opportunities that had never been possible before. This new activity required a new perspective on economics and trade.

The Portuguese cornered the market on spices as they were the first ones to send ships

to India, but their cornering of the slave trade would prove to have the most long-lasting effect on both the Portuguese and the Africans. The discovery of the Americas drove this new enterprise, and slaves became one of the more lucrative commodities for the Portuguese. This business caused four million Africans to be transferred to Brazil, and the slave plantation became the cornerstone of the Brazilian economy for centuries. For the Spanish, the innovation of the *encomienda* was a necessary means for financing the voyages to the Americas. Without the ability to create a royal monopoly the way the Portuguese had, the Spanish monarchs instead granted charters to those men who had the ability to fund their own expeditions. This charter guaranteed that the holder would have ownership of all products discovered in the area, as well as control of all of the native people residing in the region, with the right to exact tribute—conditions that often led to *de facto* slavery. The monarch relinquished his rights of ownership in exchange for a twenty percent tax over the products shipped in and out of the Americas.

The British also developed slave plantations in North America and the Caribbean, which exported crops such as tobacco, cotton, and sugar. However, North America did not become the crux of the British Empire until after the eighteenth century. The British began concentrating more on Asia, and India in particular, and this was made possible by bodies such as the East India Company. The use of a merchant company was convenient for the Crown, because the investors in the company financed the voyages, leaving minimal risks for the royal treasury, especially when the East India Company proffered loans to the government. The East India Company soon grew so powerful that it had private armies that advanced its interests throughout India. The Dutch also had an East India Company, and their company directed its interests more toward the South Pacific Sea and Japan. The Dutch were interested in breaking the Portuguese monopoly over the spice trade, and they were largely successful in the seventeenth century. In addition, they also broke the Portuguese control of the trade in Japan, by convincing the Tokugawa shoguns that they were not as interested in religion as the Portuguese. All of these

enterprises relied on either virtual or actual monopolies—monopolies that were to crumble under social, political, and economic pressures. Although the *encomienda* system was abolished in the sixteenth century, the other institutions did not meet their full demises until the nineteenth century.

Slave Factories—The Economics of the African Slave Trade

During the era of the Atlantic slave trade, hundreds of slave-trading entrepôts dotted the West African coast from the Senegambia to Angola. Some were impressive stone-built forts, while others were little more than wooden stockades. All were generally referred to as “Slave Factories” by the captains and traders who sought human cargoes to transport to the Americas.

Most of these factories were under the control of local African states. However, along the Gold Coast and in the Senegambia (particularly on the island of Goree), the fortresses that were originally built as centers for the gold trade were later converted to centers for dealing in enslaved humans. Regardless of who controlled each factory, the factories served a similar purpose: to concentrate enslaved persons so that when ships arrived the enslaved people could be loaded as quickly as possible.

Those who operated the factories purchased enslaved persons from slave raiders and traders who operated in the African interior and who often marched the slaves hundreds of miles to reach the coast. The conditions in the factories were often deplorable, and perhaps as many as 10 to 25 percent of those who reached these factories died of disease or malnutrition while awaiting the arrival of slave ships.

When slave ships arrived, the captain or chief merchant would generally visit the factory and offer to the local authorities samples of the trade goods that had been brought to purchase the cargo of captives. These goods could include distilled spirits, cotton cloth, tobacco, cowrie shells, firearms and powder, and iron bars. Notably, as European or American slave traders had little means by which to coerce their African counterparts, the terms of exchange in regard to

price were often set by the African merchants. For example, European merchants preferred to use textiles and spirits to purchase captives, as these offered them the highest profits, but African traders often demanded such goods as firearms and cowrie shells, which offered lower profit margins due to the complexity of manufacture or the distance at which they had to be acquired (cowrie shells came from the Maldiv Islands in the Indian Ocean).

Middlemen—Arab Merchants in Two Worlds

In the early modern period, Arab merchants in the Mamluk period and then the Ottoman period were the key figures in linking the Indian Ocean and overland Silk Roads trade with Europe. These Arab merchants established trade networks not only through all of the Islamic world but also well into sub-Saharan Africa, Hindu kingdoms in India and Southeast Asia, and even in East Asia and parts of Europe. While many of the merchants were Muslims, Jewish and Christian Arabs also practiced their trade in these networks.

The trade networks linked the merchants back to their home communities in Egypt and Syria, particularly in the cities of Alexandria, Cairo, Damascus, and Aleppo. Here merchants received goods and sold them in the open air markets known as *suqs* or roofed markets (*khans*). The khans became increasingly reserved for use by the long-distance trade merchants. They were usually two-story buildings that provided storage space on the ground floor for merchandise and pack animals, while the upper story was used as a residence and shop, particularly for coffee and textiles. During the Ottoman era the covered markets became increasingly commonplace in the regional cities, so much so that many referred to a collection of khans as a *suq*.

Long-distance merchants were known as *tujjar* and primarily dealt in luxury goods such as textiles, coffee, and spices. These goods were imported from Yemen, India, and East Asia and then were sold throughout the Middle East and Europe. While their emphasis was on luxury goods, the *tujjar* also sold common mundane goods primarily to cover operating expenses in order to gain as much profit as possible from the luxury goods.

The *tujjar* formed loosely organized consortiums wherever they operated, with the leader of the consortium also operating as their representative to the local government. In many areas the consortiums often became dominated by wealthy families, and the leadership became hereditary, although one did not have to be a family member to be included in the consortium.

➤ THE KARIMI—CAIRO'S SPICE MERCHANTS

During the Middle Ages, Cairo's trade network stretched across North Africa, Asia, and the Mediterranean and into the Indian Ocean, particularly during the Mamluk sultanate (1250–1517). The Karimi were a merchant clan based in Cairo, although they also operated in other cities that specialized in the spice trade. Other merchant clans also traded in spices, but the Karimi remained the most dominant, beginning their near monopoly in the Indian Ocean during the reign of Saladin.

Many of the Karimi were Jewish, although others converted to Islam in order to gain favor with the Mamluk sultans. From the ports on the Red Sea, they sailed in convoy formations to purchase pepper and other spices in India and Sri Lanka and then returned to Cairo and Alexandria to sell to Italian merchants. Their dominance in the Egyptian spice trade lasted until 1423, when Sultan Barsbay monopolized the spice trade for the state. Rather than lose their lucrative business, many of the Karimi and other clans simply immigrated to India and continued their business away from the government's controls. This, rather than the arrival of the Portuguese in the Indian Ocean, appears to be the cause of the decline of commercial tax revenues in the Mamluk sultanate.

—Timothy May

The trade varied greatly between regions. Although Arab merchants were very active in trading with Europeans, most of the goods transported through the Mediterranean traveled on European ships. Here the Arab merchants were true middlemen, receiving goods from the east and selling them to the west. Initially the focus was on textiles and spices. Later coffee was added to the mix. In addition, Arab merchants began to purchase New World products like tobacco and silver specie and sell them in the transregional trade. Gradually New World foods entered into the assortment of goods as well.

In the Indian Ocean trade, Arab merchants were much more active in transporting goods, including coffee, silver specie, and tobacco to India, Iran, and East Asia. In the Indian Ocean trade, until Portuguese dominance, Arab merchants dominated the trade. These included Arabs from Egypt and Syria but more so Arabs from Yemen and Oman. Slaves from East Africa were also a major commodity for sale in India, where the Mughal emperors and nobles purchased them as eunuchs.

In the overland trade, Arab merchants led caravans to central Asia and even into China. The western terminus for the trade were the markets of Aleppo and then to the rest of the Mediterranean. Silk and other textiles formed the bulk of the trade. Most of the silk involved in the overland trade came in the form of raw silk from China and Iran, where it was then refined and woven by skilled weavers in the shops of Aleppo. The trans-Saharan trade also remained a major source of revenue. In addition to domestic slaves, merchants dealt in ivory, ostrich feathers, and gold. Mundane items were also bought and sold but, again, primarily to cover operating expenses, as Ottoman officers paid high prices for ostrich feather plumes for their headgear.

While banditry, like piracy for the seaborne trade, remained a threat, the greatest threat to the prosperity of the Arab merchants was the policies of the Safavid empire. For most of the Safavids' existence, they were amenable to trade coming from the Ottoman empire, even if their politics and armies clashed. Nonetheless, when the Safavids created a monopoly on the silk

production, this did threaten to cut the Arab merchants out in favor of European merchants operating in the Persian Gulf.

What is most notable about the Arab merchants in the early modern period was their ability to adapt. Exposed to nomadic raids, pirates, and eventual domination of the Mediterranean and the Indian Ocean by European merchants and governmental economic policies, the Arab merchants continued to adapt to changing conditions. Only with the rise of European imperialism and industrial production in the nineteenth century did Arab merchants find themselves in increasing difficulties.

Hong Merchants

For much of the Qing dynasty (1644–1911), the Hong merchants formed part of the Canton system of maritime trade between China and the West. Holding official licenses granting them exclusive rights to trade with the West, they acted both as merchants engaged in trade for their own profit and as guarantors of the order and security of the port on behalf of the Chinese government. Although only occasionally arranged into a monopoly called the Co-hong, this term has gained currency in the West as their collective designation. Their control over China's commerce with Europe and America could prove extremely lucrative. However, the need to satisfy two sides with very different ideas about trade and international relations often placed them in difficulty, a position that became more acute as British power and assertiveness grew in the nineteenth century. The crisis of the Opium

War (1840–1842) led to the end of the Hong merchant system.

In 1684 after securing control over the entire Chinese coast, the Manchu Qing government repealed its prohibition on overseas trade. The following year a maritime customs administration was established in the province of Guangdong, and a group of merchants was licensed to deal in foreign trade. It was common in China for a group of commercial houses (called *hang*, the origin of the word “Hong”) to collectively manage certain types of trade, and those dealing in foreign commerce came to be known as *yang* (“overseas”) *hang*, or the Thirteen Hong (a purely conventional number).

Trade with Europe, at first permitted at several ports along the coast including Ningbo in Zhejiang and Xiamen (Amoy) in Fujian, gradually coalesced at Canton (Guangzhou). Britain’s East India Company established a permanent “factory” (trading premise) there in 1715 and was joined by traders from other nations, while Chinese merchants from other provinces, particularly Fujian, also made it the base of their operations. British attempts to revive trade at other ports in the 1750s failed, and by 1758 Canton had formally become the only port open to Western traders (although nearby Portuguese and Spanish colonies had the right to send vessels to certain other ports).

The role and function of Hong merchants likewise shifted. In the early decades of the trade they often served merely as agents for powerful officials, but by the mid-1700s they were trading entirely on their own account as well as managing the subordinate staff of compradores (provisioners), linguists (interpreters), and others required for the operation of the port. In addition, the wealthiest Hong merchants were required to serve as security merchants, guaranteeing that Western traders and sailors would pay assessed duties and fees and obey other Chinese regulations. The security merchants also acted as intermediaries for all communication between Europeans and Chinese officials.

From a commercial perspective, the Hong merchants profited greatly from the growing English demand for tea. Trade in Indian cotton and other commodities was more volatile but

➤ HONG MERCHANT FAMILIES

The wealthiest Hong merchant families were the Pans and the Wus, whose firms rose to prominence in the latter half of the eighteenth century. The Pans used their wealth to become particularly active in the local cultural sphere, collecting books, building magnificent gardens, and composing poetry. Their fortune was eclipsed in the nineteenth century by that of the Wus. Relative latecomers to the trade, the Wu family prospered enormously under the stewardship of Wu Bingjian (1769–1843), known to contemporary Westerners as Howqua. As with other Hong merchants, the presence of *qua* in his commercial moniker (from *guan*, “official”) reflected the nominal bureaucratic rank he received in return for contributions to the government. Howqua was particularly close to American merchants at Canton and built up a portfolio of overseas investments, including railway shares. It has been suggested that his fortune, estimated at 26 million Spanish dollars, was the largest of any merchant of his day anywhere in the world. Despite their riches, members of both families sought (usually in vain) government permission to retire from the risks and frequent fiscal demands that fell upon them as the greatest Hong merchants.

—Matthew Mosca

also generally profitable. The most successful Hong merchants undertook sophisticated commercial and financial transactions on a global scale, often through British, Indian, or American agents. However, they also bore the heavy burden of providing gifts to the emperor and contributions in time of crisis as well as fees and bribes to local officials. Moreover, many Hong merchants had little capital, and it was not uncommon for them to go bankrupt through desperate and imprudent loans or transactions. In such cases, other Hong merchants became collectively liable for their debts. Several expedients were attempted to meet these difficulties. In 1720–1721 and 1760–1771 they organized themselves into a single trading monopoly (called the *gong hong*, or Co-hong). This system, designed to increase Hong profits and leverage, collapsed due to internal rivalries and foreign pressure. In

1780 a Consoo fund, designed to liquidate the debts of bankrupt merchants and cover other liabilities assessed on them as a corporate body, was established from the proceeds of a 3 percent levy on all trade.

The fortunes of individual merchants varied widely. The small number of Hong merchants who succeeded in accumulating enormous fortunes lived in luxurious estates and became important patrons of local culture and education. However, many Hong merchants also went bankrupt, which could result in their imprisonment or exile. Over the course of the nineteenth century the Canton system began to break down. Rebellions and natural disasters within China led to larger exactions, it became more difficult to find experienced and wealthy merchants willing to fill vacant positions as Hong merchants, and the growth in smuggling illegal opium increased imperial pressure on them to control foreigners. Guided by the view that freer trade would increase the volume and value of their commerce, Westerners increasingly resented the monopoly of Hong merchants on trade and diplomatic communication, especially after the dissolution, in 1833, of the British East India Company's monopoly on trade between England and China. The foreign trade monopoly of the Hong merchants was abolished in 1843 as part of the agreement ending the Anglo-Chinese Opium War (1839–1842).

Dutch East India Company

The Verenigde Oostindische Compagnie (VOC), or United East India Company, was established by a group of merchants and mercenaries on March 22, 1602, and ushered in a 200-year Dutch hegemony in maritime trade. Known as the Jan Compagnie to the indigenous people of India, Indonesia, and East Asia, the company traded and battled its way to Dutch supremacy in Asian-European trade. During those two centuries of existence, the VOC built almost 1,500 ships, and more than 1 million people sailed as passengers, craftsmen, soldiers, or seamen to ports forcibly established throughout Asia. The primary purpose of the VOC was to be the monopolizing power in the Asian spice and pepper trade. By the end of the seventeenth century, the VOC had a monopoly on nutmeg, mace, and cloves and cornered much of the pepper market. Coffee, tea, and opium were also very profitable. In the eighteenth century, trading in spices was subsumed by textile goods and fabrics such as dyed cotton batiks and silk.

The VOC was formed by charter after initial spice expeditions carried out by competing smaller companies in the last decade of the sixteenth century. The central government of the United Provinces (now the Netherlands), known as the States-General, ordered the competing companies to combine and work together to establish Dutch dominance over the Portuguese and English in the extremely lucrative spice trade.

The VOC was able to establish monopolies for two related reasons: Their charter allowed them to use force, which they did without hesitation, and certain commodities could only be grown in very specific locales. The VOC was a merchant-soldier company and throughout its history employed more soldiers than seamen to outfit its expeditions. The military component of the VOC helped it become profitable; for example, nutmeg and mace were found only on the Banda Islands. The VOC quickly overpowered the indigenous government there, setting up an agreement whereby the Bandanese could trade only with the Dutch. Similar agreements were made throughout the East Indian islands of Java, Sumatra, Ceylon (Sri Lanka), and the Moluccas. The VOC generally established military

fort-ports in the islands where they traded. The most important of these ports were Batavia (formerly Jacatra, now Jakarta), on Java, and the Cape of Good Hope in South Africa. Founded in 1619 and 1652, respectively, these fort-ports were seats of Dutch power in the Indian and Pacific oceans and facilitated the establishment of the VOC's trade monopolies.

The VOC was governed by a board of directors known as the Heren XVII or Gentlemen XVII. The directors were the former governors of the original companies that came together to form the VOC. The cities from which these companies came became chambers. Local participants within each chamber, including servants, women, and bureaucrats, were individual shareholders in the VOC. Each chamber contributed delegates, the number of which was determined by the capital that chamber invested in the whole company. At its inception, the VOC collected 6.5 million guilders. The largest share of 3.7 million guilders came from the Amsterdam chamber; the Zeeland chamber deposited 1.3 million, Enkhui-zen deposited over 500,000, and the lowest was 170,000 guilders deposited from the Rotterdam chamber. The original capital stock was never increased in 200 years of the VOC's existence.

VOC seamen were notoriously hardened. Men from various northern European nations joined VOC crews because they had no other way to support themselves. The crews were composed of a mean sort of men because of the danger of the job. Two out of three seamen in the employ of the VOC died from disease at sea or while in service at posts in Asia. Despite rules to keep the ship somewhat hygienic, diet was poor, and the tropical weather exacerbated the spoiling of food and drink and the weak health of the men. However, the profits of the VOC—as much as 10,000 percent—were more than enough to keep the directors outfitting voyages.

We know about many aspects of VOC trips from contemporary travel accounts, such as the one by Nicolaus de Graaff. For example, the VOC had many rules to maintain order and hygiene on board. The most grievous crimes were mutiny, sodomy, and murder, but other crimes included playing cards or dice, gambling, and defecating in unapproved spots. Punitive measures included fines, solitary confinement, branding,

► PIETER VAN DAM'S *BESCHRYVINGE VAN DE OOSTINDISCHE COMPAGNIE* (DESCRIPTION OF THE EAST INDIA COMPANY), 1685–1703

Pieter van Dam (1621–1706) wrote the *Description of the East India Company* during 20 years of service for the Dutch East India Company (Verenigde Oostindische Compagnie, or VOC). The *Description* is a multivolume work that contains information about the VOC and its dealings in Asia. It was intended as a practical report on the VOC and to serve as a basis for reforms in the company. These records were so important to the company that during its lifetime, the VOC had the documents locked in a box that needed three different keys to be opened. These documents have since become important primary sources for historians.

Van Dam recorded policy and wrote letters to foreign kings and dignitaries on company policy as part of his job as the secretary, or *advocaat*, of the VOC. He was the chief permanent official of the VOC in the last half of the seventeenth century. Van Dam was 80 years old when he completed the *Description* in 1701.

—Elizabeth Sutton

flogging, keelhauling, and death. Women were not employed by the VOC, and those who tried to stay with their husbands by disguising themselves were dealt with harshly.

The VOC began to decline in the late seventeenth century and was routinely bailed out by the Dutch government throughout the eighteenth century. Overcome by corruption and debt, the bankrupt VOC was permanently disintegrated in 1798.

The Dutch East India Company in Japan

The Dutch East India Company (Vereenigde Oost-Indische Compagnie in Dutch) was founded in 1602 and granted a 21-year monopoly on colonial activities in Asia by the States-General of the Netherlands. Aware of the lucrative voyages made to Asia by the Portuguese throughout the sixteenth century, the companies that would eventually make up the company had already begun making voyages to the Indies in 1595. The first to Japan began in 1598 when 22 ships departed Rotterdam for the Far East. Met by a series of disasters, the *Liefde* (Charity), the sole survivor of the fleet, drifted into Bungo, on the eastern shore of Kyushu, on April 19, 1600. Only 25 of the crew of 110 lived, and 5 more of them died ashore. Olivier van Noort of Utrecht was able to inform those in Rotterdam of the fate of the *Liefde* in 1601, when he returned from his own voyage to the east. During this time some of the crew, such as Melchior van Santvoort and Jacob Jansz Quaeckernaek, who had captained the *Liefde*, made voyages throughout Asia on Japanese or private junks.

In the spring of 1605 Quaeckernaek left Japan for the Netherlands with a license from Tokugawa Ieyasu for the Netherlands to trade with Japan. The first company ships to Japan arrived on July 6, 1609, and docked in Hirado. The men bore a letter to the shogun from Prince Maurice of Orange with the purpose of establishing a Dutch factory in Japan. Permission was granted by Ieyasu, and the Dutch established their trading post in Hirado since the Portuguese were firmly entrenched in Nagasaki. The first years of the factory were difficult because there was no steady supply of saleable goods, and the merchants relied heavily on the privateering of Portuguese vessels and Chinese smugglers. The Portuguese and Spanish also attempted to obstruct Dutch

trade by arousing suspicion among the Japanese, but the Dutch counteracted the attempts by telling the Japanese that the former had military and religious designs on Japan. Dutch shipping finally began to increase about 1617 and was greatly facilitated by the establishment of Batavia in 1619.

To improve supplies of Chinese silk, at that time the most significant trade item in terms of volume and value, a factory was established on Formosa (now Taiwan) in 1624 in order to facilitate contact with Chinese smugglers. This factory led to what is known as the Nuyts Affair. Pieter Nuyts was sent to pay respects to the shogun before taking office as governor of Taiwan. Nuyts's ignorance of Japanese protocol and arrogance caused the shogun to refuse to see him altogether. After taking office, Nuyts's inept efforts in 1628 to curb Japanese competition caused the Japanese traders on the island to take him hostage. When the shogun heard how he had treated subjects, he cut off all trade with the Dutch East India Company. Nuyts was arrested in Batavia and sent to Japan for punishment in 1632. There he was put under house arrest, and trade with the Dutch resumed a year later. From this time on, the Dutch made annual journeys to the capital to pay their respects to the shogun.

By this time the Portuguese were the only other foreign traders left in Japan, the Spanish having been expelled and the English leaving of their own accord in 1624. With the Dutch factory reopened, the shogunate moved to curtail Japanese movement abroad and to contain the Portuguese on Deshima, an artificial island in the Bay of Nagasaki. The outbreak of the Christian-led Shimabara Rebellion in 1637 led the shogunate to expel the Portuguese, as it viewed Christianity as a threat to its power. The Dutch East India Company was allowed to continue to trade in part because they sent a ship to fire upon the castle in which the rebels were under siege, in addition to the fact that the shogunate had long ago viewed Holland as a non-Christian state, and the Dutch had not concentrated on religious conversions in Japan. In 1641 the Dutch were ordered to move from Hirado onto the recently vacated island of Deshima.

They unhappily settled into the confines of the island (measuring 235 by 70 yards or 215 by 64 meters) that was connected to the mainland

by a guarded gated bridge. Deshima contained residences, warehouses, offices, and a garden. The number of people there varied over time but averaged about 15 Dutch residents, including the factory head, senior and junior merchants, the bookkeeper, the scribe, the warehouse master, and the doctor. The Dutchmen also brought slaves, usually of Indonesian or Indian descent, and various Japanese local and shogunal officials and workmen also spent time on the island.

Trade between the Dutch East India Company and the Japanese went through a variety of incarnations. For most of the seventeenth century the primary import into Japan was silk, which was exchanged for metal bullion. Later other textiles like wool came to increase in importance. Until 1668 this metal bullion was primarily silver but was replaced by copper when silver export was forbidden in that year. Silk was handled by what was called the *pancado* or *itowappu*, in which prices were fixed and sold to specified merchants. In 1655 this was abandoned. Trade occurred based on mutually agreed prices (*aitai shōbai*). Fears over the outflow of precious metals put an end to this practice, which was replaced by taxation. The taxation system was relatively successful in halting the outflow of gold and silver, but further measures were taken in 1685 by capping the amount of trade and reinstating the *itowappu*. In 1698 all foreign trade was put under the Nagasaki Geldkamer or *kaisho*. This office served as a middleman between the Dutch traders and Japanese merchants. All purchase prices were determined by the *kaisho* and were paid out in copper after deducting rent, food, and other expenses. The goods were then auctioned to the merchants. In 1700 a limit was set to five Dutch ships annually, which was reduced further to two in 1715.

These restrictive practices decreased trade value and volume considerably. However, in addition to the official company monopoly, from 1685 private trade was officially recognized by the shogunate. The company frowned upon its employees trading for their own profit, but because the company did not want to bother with many things that did not offer significant profits and the Japanese insisted that they be imported, trade was allowed by individuals. The company monopolized the import of many textiles and

other items in demand like spices, exotic woods, and buffalo horn. Company servants brought things like glass, pocket watches, and books. Private trade came to increase in significance as company trade declined.

While the primary purpose for contact on both ends was to conduct trade, the Dutch East India Company also had the significant role of conveying information into Japan through both formal and informal channels. Formal channels included the presentation of *fū setsugaki* which were reports on world events and audiences with the shogun, who might ask all sorts of questions about the outside world. Informal channels included interpreters, many of whom came to study more than language, and contacts with Japanese scholars.

The collapse of the Dutch East India Company in 1799 did not signal the end of Dutch trade with Tokugawa Japan. For a while the factory limped by relying on chartered ships. Eventually the Netherlands Trading Society, an organ of the Dutch government, took over the factory on Deshima, handling trade matters until commercial treaties were signed in the 1850s.

English East India Company

During the first wave of European expansion in the early modern period, many countries had merchant companies dedicated to trade in Asia. England and, later, Britain were no exceptions. The “Governor And Company Of Merchants Of London, Trading Into The East Indies” was brought into existence by a royal charter on December 31, 1600; it was the fruit of several years of lobbying during the reign of Elizabeth I. The company was established to break Portuguese control of the spice trade and to compete with rival Dutch traders who had the same goal.

While profits were the primary objective, political reasons also played a role in the growth of the East Indies trade.

In the early years of the company, investors subscribed to each voyage separately. Many of the investors were part of London's mercantile community, and several had close ties to court. Even so, investors struggled to raise over £70,000 needed for the first voyage in 1601. It was not until the mid-seventeenth century that the East India Company (EIC) became a full-fledged joint-stock company and that investors committed to longer-range projects. The company was well organized and aggressive; its close financial relations with the Crown and growing profits made it a wise investment. Nonetheless, the Dutch East India Company (VOC) held an advantage over its English counterpart (including far more capital) and flourished from the 1580s to the 1680s, its golden age. Dutch strength in the region is best illustrated by the Amboina massacre of ten English merchants by the Dutch in 1623. This incident was the culmination of a protracted commercial struggle that forced the English to withdraw from the Dutch East Indies (present-day Indonesia).

Initially, English merchants sought to trade goods such as woolen cloth, lead, and tin that were not in great demand in Eastern markets. They found that silver bullion was much sought after and had a higher value in Asia. In the initial phase of trade, the company purchased enormous amounts of pepper for import and re-export, although it was also interested in other spices, cotton, silk goods, indigo, and saltpeter. Mortality and morbidity of seamen and merchants were a great problem, especially in the early voyages, but handsome profits meant that many were willing to take the risk.

The Dutch and English built their trading empires largely at the expense of the Portuguese. The Portuguese presence in the area still presented numerous obstacles for other Europeans who wished to trade, as did the vagaries of local politics and rulers. When the English defeated the Portuguese in India in 1612, they won valuable trading rights with the Mughal empire (which depended on client navies to police the waters).

Because the "Honourable Company" was tied closely to the favor of the Crown, the

political turbulence in Stuart England extended to the English abroad (especially when the EIC's charter was about to expire). The company weathered the storm, and by the late seventeenth century it had established land bases in India and used increasing force to protect its interests in the region. The company's monopoly did invite challenges from those who supported free trade and sought to share the profits, and the company managed to absorb or amalgamate with rival companies. During the eighteenth century the charter was renewed several times, with greater and greater financial concessions to the Crown from its very considerable earnings. By financing loans to the government, the company bought goodwill for its own endeavors in the East.

The cotton-goods trade declined after the mid-eighteenth century, but tea (imported from China) became extremely important for the company, and the EIC's presence in China was instrumental in spreading British influence in the Far East. Imports of textiles (such as calicoes, cotton, and silks) as well as various spices and foodstuffs completely altered the day-to-day existence of British society at all levels. By 1757 the company was bringing 3 million pounds (1.36 million kilograms) of tea to Britain. While trade with the East in the seventeenth century was characterized by the desire for spices, the eighteenth century was dominated by the tea trade.

The EIC became an agent of imperialism in India from the early eighteenth century (lasting to the mid-nineteenth century). The company was allowed to maintain an army to protect its trading interests abroad. However, the army became central to the expansion of British rule in India.

By the second half of the eighteenth century, the company was very influential in the subcontinent, especially in and around its bases in Bombay, Madras, and Calcutta; it seemed as if the company was just as interested—if not more so—in acquisition of territory and in power politics as in trade. The enormous power of the EIC in Asia brought more and more calls for government involvement from Britain. Parliament struggled to deal with the empire that Clive and the company had wrought. The company increasingly came under government scrutiny and was subject to

restrictive legislation during the nineteenth century. After the Indian Revolt of 1857, the British government took direct control of company territory in India. The company continued as an entity until 1873, when it was dissolved.

Western historians tend to emphasize the cultural changes introduced into the East by the company, while Asian scholars paint its influence in a much more negative light. Few would argue that the East India Company had a massive political, economic, and cultural impact in Asia and in Britain.

Slave Plantations in the British Caribbean and North America

The European encounter with the Americas in 1492 and the decimation of the indigenous populations opened vast tracts of land to agriculture. In 1493 a year after his epochal voyage, the Italian explorer Christopher Columbus imported sugarcane into the Caribbean, and its cultivation became the basis of the first plantations in the Americas. Spain was quick to exploit its opportunities in the New World, enslaving Indians and forcing them to work on the sugar plantations. The Portuguese soon followed in the seventeenth century. However, it became impractical to use the natives, as harsh work conditions and diseases rapidly killed many, and familiarity with the terrain made it easy for those who did survive to run away. Because of this, Europeans began to develop the transatlantic slave trade, importing slaves from Africa to work on the plantations.

The English first developed colonies in Jamestown, Virginia, in 1607 and on the Caribbean islands of St. Christopher in 1624 and Barbados in 1627. The success of the Portuguese in growing sugarcane on slave plantations in Brazil did not at first inspire the English to follow

suit. In the early years at Jamestown the colonists struggled simply to survive and only after 1617 established plantations. Tropical sugarcane would not grow so far north. Instead, the colonists made tobacco their cash crop and in 1619 imported the first slaves, although the English at first relied primarily on indentured servants. Diseases were then rampant, and slaves were judged to be a costly investment on the mainland. After 1660, with the supply of indentured servants shrinking and many servants surviving to demand land of their own, the colonists shifted from free labor to slave labor on the tobacco plantations of Virginia and Maryland.

Successful in growing tobacco in the Chesapeake, the English transplanted it to the Caribbean but not at first as a plantation crop. Around 1650 the English replaced free farms with slave plantations and tobacco with sugarcane on Caribbean colonies. The English then adapted the Caribbean plantation system to the Carolina coast, establishing rice plantations around Charleston in the 1680s. English growers relied heavily on their slaves' knowledge of rice cultivation when the English turned to this crop. West African slaves, particularly women, contributed not only labor but also expertise as rice plantations were established.

The plantations in the Caribbean and North America required a steady influx of new slaves

➤ SLAVERY—TWO ACCOUNTS

The following excerpts offer perspectives on slavery from the contrasting standpoint of the owner and an enslaved person. The first, an earlier account, is an excerpt from Richard Ligon's *A True and Exact History of the Island of Barbados* (1657). Here he is describing a planter's work managing the labor on a sugar plantation:

"I can name a Planter there [Barbados], that feeds daily two hundred mouths, and keeps them in such order, as there are no mutinies amongst them; and yet of several nations. All there are to be employed in their several abilities, so as no one is idle. The first work to be considered, is Weeding, for unless that be done, all else (and the Planter too) will be undone, and if that be neglected but a little time, it will be a hard matter to recover it again, so fat will the weeds grow there. But the ground being kept clean, 'tis fit to bear any thing that Country will afford. After weeding comes Planting, and they account two seasons in the year best, and that is, May and November; but Canes are to be planted at all times, that they may come in, one field after another; otherwise, the work will stand still. And commonly they have in a field that is planted together, at one time, ten or a dozen acres. This work of planting and weeding, the Master himself is to see done; unless he have a very trusty and able Overseer; and without such a one, he will have too much to do."

The second quote is from a later account, *The History of Mary Prince, a West Indian Slave* (1831). Mary Prince was a slave on Barbados in the early nineteenth century:

"Mr. D— had a slave called old Daniel, whom he used to treat in the most cruel manner. Poor Daniel was lame in the hip, and could not keep up with the rest of the slaves; and our master would order him to be stripped and laid down on the ground, and have him beaten with a rod of rough briar till his skin was quite red and raw. He would then call for a bucket of salt, and fling upon the raw flesh till the man writhed on the ground like a worm, and screamed aloud with agony. This poor man's wounds were never healed, and I have often seen them full of maggots, which increased his torments."

from Africa as well as Indians from the North American mainland to offset the large loss of slaves due to heavy workloads and tropical diseases. Work on the plantations often was unremitting and monotonous. Slaves toiled from dawn to dusk planting, cultivating, and harvesting crops. Certain crops, such as rice in the Carolinas, required extensive work through the hot summer months. There slaves could be assigned specific tasks each day. The demand for labor was acute during harvest, particularly on the sugar plantations in the Caribbean, where slaves had to cut and process sugarcane within hours to prevent the deterioration of sugar in the cane. The urgency of this work compelled slaves to toil day and night in the processing plants. Slaves worked not only in fields and factories but

also as overseers when white labor was scarce. In addition, many slaves were trained as skilled builders, craftspeople, and house servants to make each plantation a self-sustaining economic institution.

As a matter of law, masters controlled the labor of slaves. Although some masters offered incentives as motivation, such as time off from work, extra food or clothing, and even cash, compulsion and abuse were widespread. Masters did not hesitate to whip noncompliant slaves to set an example of what other slaves could expect for work that was less than diligent. Additional punishments included branding and castration (for runaways) as well as death.

As an institution, the slave plantation spread from Spanish and Portuguese colonies and then

English colonies throughout the Caribbean and the American South. These plantations were part of the larger transatlantic slave trade that formed an early mercantile economy. Many British merchants profited economically from the trade of slaves and goods produced by slaves on plantations. However, the long-term consequences of slavery and the plantation system were enormous. Slave plantations fostered a racial hierarchy of white over black, as owners justified slavery with arguments of racial superiority. The legacy of slavery and racism has continued to plague the United States for more than a century and a half after abolition.

Innovations in the Plantation Complex—The *Encomienda* and *Hacienda* in Hispanic America

In the wake of the conquest, the Spanish commanders and Crown were hard-pressed to find ways in which to reward the conquerors. The members of the conquest expeditions were not soldiers in the strict sense of the word. They did not receive a salary from the Crown but instead were investors in a company. They expected to be rewarded for their efforts in proportion to their investment in the expedition. While some conquerors did gain gold, silver, and precious stones, all too many did not. In order to reward the conquerors, the local commanders with the acquiescence of the Crown allocated the two limited resources of the Americas: land and labor. In short, the *encomienda* was an institution of labor allocation, the *hacienda* an institution based on land that utilized labor.

Based upon traditions forged in Spain during the reconquest of the Iberian Peninsula from

the Muslims, the Spanish Crown authorized conquerors of the New World to collect taxes and tribute from the conquered peoples. This grant of tribute was called an *encomienda*, from the Spanish word *encomendar* (“to entrust”). Under this grant the natives of a specific town or village were required to pay taxes and tribute to a Spanish conqueror or early settler. Early in the history of the New World, part of the tribute was collected in the form of labor, given that most native communities did not use currency prior to the arrival of the Spanish. The Spaniard who received the grant of tribute was required to provide basic services to the natives, in particular to provide for their conversion to Christianity and to pay for the services of clergy to them.

Members of the conquering expeditions also received grants of land, called *mercedes*, upon which they could cultivate crops to provide for the sustenance of the colony. Under most circumstances, the conquerors used the labor services of the natives entrusted to the *encomienda* to raise crops, serve their households, and provide other labor for them. Because Indians in *encomienda* were used on estates, some modern observers concluded that the *encomienda* was a system of land distribution and exploitation, which it was not.

The institution of the *encomienda* quickly became emblematic of Spanish exploitation of the natives. The *encomienda* became associated with Spanish excesses in the New World and the exploitation of the natives in particular. A series of royal decrees from 1512 until 1542 sought to regulate and control the *encomienda*. In 1512 the Crown issued the Laws of Burgos, which effectively limited the *encomienda* to a system whereby recipients enjoyed native tribute, either in money, goods, or labor. This did not quiet critics who claimed that the institution was responsible for nothing less than the destruction of the native population of the Americas. Consequently, in 1542 the Crown promulgated the New Laws, which provided for the eventual disappearance of the *encomienda*. While new grants would be made throughout the sixteenth and seventeenth centuries as Spanish explorers gained new territories in the Americas, in the core areas of Mexico and Peru the *encomienda* began to disappear.

The New Laws provided for a transition to a system of wage labor wherein individual Spaniards would contract with the natives for their services. The intermediary institution was the *repartimiento*. Under the *repartimiento* a Spanish landowner would request a specific number of workers from a government office created for the distribution of Indian labor and for the transfer of money from the landowner back to the natives. As natives became accustomed to wage labor, the *repartimiento* would disappear. In fact, wage labor did slowly become the norm in colonial Latin America in the seventeenth and eighteenth centuries. It should be noted that from the very first years of the colonies, African slavery existed alongside native labor systems in many regions and was ubiquitous with certain industries, such as sugar production.

While the Crown was regulating the use of Indian labor in the colonial world, landownership developed under fewer constraints. Settlers could petition local royal officials for allocations of land. City councils were responsible for allocating house and garden plots within their territories. The royal government allocated land in rural areas for farms and ranches. A slightly different system existed for mines whereby miners could register their claims with the royal government. Yet none of these properties had value without the labor to exploit them. Farms, ranches, and mines needed large numbers of laborers to produce their goods. Consequently, *encomenderos*, with access to native labor through their grants, had an advantage over others. In this way the *encomienda* became associated with landowning.

The hacienda, simply speaking, is a large, highly integrated rural estate. It was based on the use of a large labor force. The hacienda might produce any of a wide range of goods, depending on the location. In central Mexico cattle, corn, and wheat were important; in southern Peru wine played an important role; and in other areas sheep and their wool were significant. By the seventeenth century a new form of labor had arisen: debt peonage. Under this system a landowner would provide employment to a group of natives. Yet during their term of employment the landowner would provide food, clothing, and shelter at grossly inflated

prices. Paying wages to the laborers was insufficient to satisfy the debt, and so over time the workers became tied to the estate.

While many private landowners owned haciendas, it was the Jesuits, the Catholic religious order formally known as the Society of Jesus, who perfected the institution. The Jesuits developed rural estates aimed at the commercial production of agricultural products in order to provide supplies for their colleges in the cities of the region as well as to sell goods at a profit to support their missionary and educational efforts. The Jesuits also benefited from being exempt from many forms of taxation that private estates had to pay, especially the tithe, a 10 percent tax on agricultural and pastoral production.

Hacienda is a general term for a rural estate. In the case of sugar production the hacienda existed along with the *ingenio*, or sugar mill, that would turn the raw cane into sugar through a complex industrial process of grinding, boiling, and bleaching. Haciendas dedicated to raising sheep also had *obrajes*, or mills, where the wool would first be turned into thread and then woven into cloth. These industrial complexes also relied on debt peonage as well as large numbers of African slaves.

Slave Plantations in Portuguese Brazil

The plantation was the main staple of Brazil's economy until the end of the seventeenth century, when gold was discovered and replaced sugar as Brazil's largest export. From the end of the sixteenth century until the end of the

seventeenth century, Brazil was the largest producer of sugar in the world. The plantation system and the slaves who worked the plantations were staples of the Brazilian economic and social structures. Although anyone was technically able to start a plantation, in reality this required large amounts of capital. Therefore, the wealthy became the new nobility in Brazil, as they were the only ones who could afford to own a plantation.

Originally the plantation owners tried using the natives to work on their plantations. However, this did not work well, as the natives either died from disease and the hard labor or

ran away. This in combination with the voices of those who spoke out against the abuses suffered by the Indians made it less desirable to use the natives as the end of the sixteenth century drew to a close. Instead, the plantation owners turned their attention to Africa. The use of Africans as slaves was nothing new to the Portuguese, as African slaves were used in the sugar plantations on the islands of Madeira and São Tomé. The first Africans arrived as skilled laborers and in fact provided a major part of Brazil's skilled labor force. The use of the African slaves versus the Indian proved to be cost-efficient: most slaves paid for themselves in two years. The demand for this

➤ SLAVERY IN BRAZIL AND THE CATHOLIC CHURCH

Although slave life was well documented in North America, less evidence exists for those slaves who lived in South America. Therefore, historians sometimes must gather facts about how the slaves lived through other documents. A controversial topic has been the role of the Catholic Church; while it did seem concerned about the treatment of the slaves, it never condemned the slave trade. One document that shows this is the *First Constitutions of the Archbishopric of Bahia*, written by the archbishop of Bahia, D. Sebastião Monteiro da Vide, in 1707. In it he provides instructions for slave owners on how best to instruct the slaves on religion but also instructs on how to treat slaves.

One instruction lets masters know that they should not prevent slaves from marriage, nor should masters "treat them worse, or sell them to other faraway places where one of them, because of being a slave . . . cannot follow." However, Monteiro da Vide makes sure to also include that "we declare that once they are married, they remain slaves as before, and fully obligated to their masters' service."

The *Constitutions* also make it clear how slaves were able to pay for their personal necessities such as clothing. The bishop says that the masters make use "of the miserable slaves during the entire week, without giving them anything for their sustenance, or any clothing with which to cover themselves; this need . . . is met by giving them Sundays and Holy Days free so that at that time they may obtain their required food and clothing. As a result, the miserable slaves do not hear Mass,

nor keep the Law of God which forbids labor on those days. . . . [W]e exhort and ask all our subjects . . . that from now on they grant their slaves the needed support, so that they may observe the said precepts and live like Christians."

Finally, while the Church was concerned with the welfare of the slaves, it was not interested in ending the institution itself. Monteiro da Vide says that "although normally the immunity of the Church is valid and defends delinquent persons who seek shelter there, nevertheless there are exceptions to this rule concerning some crimes. . . ." Identify those that do not enjoy the immunity of the Church, he states "Nor the slave (even if he is a Christian) who flees from his master to free himself from slavery." However, the slave was not left completely without options: "if he runs away from his master because the latter intends to treat him with relentless severity, the slave will not be taken back to him unless he first makes a sworn promise, when he can make no other, that he will not mistreat him." If the master cannot promise this, then the slave "will be sold in cases when this is required by law." This document shows not only some aspects of slave life but also the complicated position that the Catholic Church had with slave owners.

type of labor force grew rapidly, causing the development of a slave trade that went from Bahia, Brazil, to central Africa. Over three centuries some 4 million slaves were transported to Brazil from Africa, constituting one-third of the total slaves brought to the Americas. In addition, as the sugar prices rose in Europe, the use of slaves as cheap labor provided plantation owners with the availability to make large amounts of capital. The slave system became so engrained in Brazil's economy that even today the Brazilian government is having to free people forcibly entered into service in the many sugar plantations located in remote areas.

The slaves on the plantations lived in worse conditions than those employed in the mines or in private homes. In Latin America the law provided that slaves be allowed to purchase their own freedom. Slaves who lived near towns were often able to use their trade knowledge to make extra money to do so. On the plantations, however, especially the sugar plantations, slaves worked from dawn until dusk, leaving them little time to make extra money. Also, the distance from the city also made it more difficult for slaves to sue their masters over abuses that the slaves suffered. Field hands were more poorly dressed, fed, and housed than their counterparts who lived in the master's house, although a few masters did try to coax harder work out of their slaves by providing them with a higher quality of life than that received at other plantations.

By the end of the seventeenth century, Brazil's dominance of the sugar trade began to decline. This was not because of the cost of growing sugar, which remained 30 percent lower than for any other supplier. The decline came from the introduction of British and Dutch sugar into the market. Even though sugar was now lessening in importance, many of the plantations remained in business as the slaves began breeding, and therefore the plantation owners did not have the need to buy as many slaves to replenish those who died. However, the African slave population did not replenish itself that quickly; the birthrates remained comparatively low. Those plantation owners who chose to change their purpose switched to growing either coffee, cacao, cotton, or food. However, the importance of the plantations would be severely diminished after the

discovery of gold and the resulting gold boom in the late seventeenth century.

Commercial Expeditions in Early Colonial North America

The expansion of Europe was based on the fundamental reasoning of obtaining whatever riches might be found across the globe. For the Portuguese, the trade with Africa (initially gold but it became slaves beginning in the 1450s) and the Far East laid the basis of their empire, although they did colonize Brazil later on. The Spaniards pursued “God, glory, and gold” in the Americas. First they conquered the native peoples by force of arms and then subjected them to their coercive and oppressive labor systems. The arrival of the English and Dutch into North America completed the cycle of depopulation and devastation to the indigenous population. Rivalries spread among various European states: England versus Spain, England versus the Dutch, and the English versus the French.

The schism between Spain and the English (beyond England's envy of the treasure coming from the Americas) lay with Henry VIII's English Reformation. His decision to rid himself of his Spanish wife engendered hostility between the two kingdoms until the end of the Napoleonic Wars. Henry understood that the only way that England could survive any conflict with Spain was for a mighty English navy to be constructed. During Henry VIII's reign the navy grew from a mere 7 ships to 53 vessels (all sailing ships, as compared to the outmoded galley).

At the time of Henry's demise (1547), England had made no significant strides in exploration, but certainly interest in and expansion in nautical knowledge and technology was on the ascent. Sebastian Cabot nonetheless had been sent out by the king to find a northern way to

the Far East. For five years after 1548 Cabot made plans for his final expedition, and he organized a number of merchants into basically a syndicate to find the fabled Northeast Passage (through the waters of the Arctic north of Russia) to Cathay, China. Cabot did not go on this epic because of his age. Instead Sir Hugh Willoughby and his subordinate Richard Chancellor led the trading expedition, which ended in failure but fostered the forerunner to the Virginia Company, the Muscovy Company.

The divide between England and Spain did not end with Henry VIII's death but instead intensified with the reign of Elizabeth I (r. 1558–1603). In reality, Elizabeth waged an undeclared war upon Spain via her fabled “seadogs,” or privateers. She also sent out expeditions to gain a better understanding of the geography of North America. For instance, Martin Frobisher was sent out to reconnoiter Labrador and Greenland. He brought back to England a whole shipload of ore to assay which turned out to be worthless. This failure basically ended his plan for colonization, as no one was willing to provide funds for his enterprise. John Davis followed Frobisher and completed the exploration of Greenland. Henry Hudson, who had worked for the Dutch, returned to England and continued to explore North America, stumbling on what became Hudson Bay. Finally, in 1615 William Baffin in his voyage determined that Hudson Bay was not the fabled Northwest Passage.

Elizabeth especially liked the skillfulness of such people as Sir Francis Drake, who harassed Spain's galleons and even attacked Cádiz. The queen consequently decided that England was ripe for empire. She entrusted a wealthy courtier, Sir Walter Raleigh, with the plans and implementation of the founding of England's first North American colony. He sent out three expeditions (1584, 1585, and 1587) to Roanoke Island to found the colony, but each ended in abysmal failure. The first two merely returned to England, while the third became known as the Lost Colony; when a relief ship appeared later, everyone had disappeared. The English and specifically the monarchy had learned some valuable lessons about colonization. First, a trading post that would merely collect the product of Indians and then profit from it was inadequate (they could

not rely just on the wealth of an Indian trade). Moreover, they must have the means to produce sufficient foodstuffs. Second, such an enterprise as colony building required an extended group of benefactors, or a joint-stock company. Two groups of merchants and government officials in 1605 sought a charter from James I to establish joint-stock companies and find stockholders. A Royal Charter was extended in 1606 that would allow for settlement of “Virginia” by these companies. The central governing board was to be located in England, and authority for day-to-day administration was vested in a Council of Thirteen. Thus, in 1607 Fort James (later called Jamestown) was founded amid the harsh environment of the James River. Soon the colonists suffered from both disease and starvation, only to be saved by the local Native Americans. (The founding of Plymouth occurred in 1620, but it was supposed to occur earlier in Virginia.)

Prior to the final success at Jamestown, with a stable tobacco crop for export, Sir Humphrey Gilbert had pushed for a colony in Newfoundland (1582). (Raleigh, as observed previously, tried to found settlements at Roanoke.) These disappointing early efforts at founding colonies did add to the corpus of geographic knowledge, as reflected on the maps that were created. Usually when such expeditions landed the explorers had little knowledge of the interior regions. Prior to launching any colonization mission, knowledge was primarily obtained via travel accounts, maps, and once landed (interior exploration as well as native reports). The central feature of the English trading companies was locating a profitable product. English settlers took with them seeds to plant English products such as wheat, peas, barley, and other crops native to their homeland. On the journey they had to rely on stores of primarily dry or salted goods (an example being pork and fish) as well as large quantities of fresh water to sustain them before they found additional sources. Although exiled from the Council of Thirteen, Captain John Smith came to lead Jamestown (as the result of dissension and bad economic times) to a large degree because of his previous military experiences.

As with the English, improved nautical knowledge and improved ships allowed France to embark on exploration and colonization in

North America. Beginning in 1603 Samuel de Champlain ascended the St. Lawrence River, founding Port Royal, and then in 1608 he founded Quebec. Champlain lived and promoted Canada until his death in 1635; however, its relative poverty did not attract a great number of French immigrants. Without precious metals, French Canadians had to rely upon local fisheries and the fur trade with the Native Americans.

Dutch beginnings in North America commenced with the explorations of Henry Hudson during 1609 (in the service of the Dutch East India Company) along the Atlantic coast and into the river that “bears his name as far as Albany.” The Netherlands hence asserted a claim to the lands along the coastline from Virginia to Canada. The New Netherland Company (a joint-stock company) was established in 1614

to pursue the lucrative profits from the Indian fur trade. This company became the West India Company in 1621 and pushed for actual settlement in what would become essentially present-day New York state.

■ Introduction: Sea Lanes and Marketplaces—Early Global Trade Centers and Networks

In the fifteenth century, the global economy centered on Asia. The Indian Ocean was the great crossroads of international shipping and the entire length of its littoral was filled with bustling port cities—from Goa, Calicut, Bombay, and Diu in India, and Aden and Muscat in the Arabian peninsula, to Mombasa and other Swahili city-states along the eastern coastline of Africa—all of which housed a rich diversity of merchants of many ethnicities and religions. Arab Muslim traders played the dominant role in the Indian Ocean basin while Chinese traders from Macao, Guangzhou, and Hangzhou controlled the East Asian waterways. Sailing in what was the most lucrative region in the world, they felt no need to expand their operations into unknown areas; neither Arabs, nor Chinese or other Asian merchants sailed into the Atlantic or Pacific oceans. Outside Asia, Europe served as a vibrant commercial hub with Italian merchants controlling the Mediterranean trade while the German traders united in the Hanseatic League exerted great influence over north European commerce. Although Europeans had no direct access to Asian

riches, Oriental goods, nevertheless, still reached European customers through Islamic trade networks. Thus, Italian city-states had a close relationship with Ottoman merchants and traders while the Portuguese and Spaniards dealt with the Moors and the Moroccans. Across the Atlantic, the Aztecs in Central America and Inca in South America developed their own dynamic trade centers and networks that were, however, isolated from the rest of the world.

By 1750, the situation had dramatically changed. Seeking access to Asian riches, Europeans had gained control over the sea-lanes and freely operated in the Atlantic, Indian, and Pacific oceans. Russia's land expansion across Eurasia integrated the wilderness of northeastern Asia into a larger trade network. The Spaniards accomplished the same in Central America and South America, while the English, Swedes, Dutch, and French established commercial presences in North America. European naval expansion forged new connections across the world, the most striking of them being those across the Atlantic and Pacific oceans. As the volume of

international trade increased so did its relative importance for a state's economy and protecting overseas trade and sea-lanes became crucial to state interests. Naval superiority allowed Europe to force its way into local trade networks and maintain control of international trade, although European states routinely quarreled among themselves. Through their dominance of international sea-lanes, Europeans transformed regional commercial networks by connecting them to each other. Commercial power, thus, became global rather than regional, and Europe held the most prominent position in this new commercial order. Within Europe, European colonial conquests and expansion produced uneven results. Spain and Portugal focused their efforts on the extraction and transportation of precious metals and were eventually eclipsed by the other commercial powers (England, the Netherlands) that profited far more from global trade. The Netherlands particularly benefited in the new economic environment, causing some scholars to identify it as the first "modern" economy. Its cities, especially Antwerp and Amsterdam, took advantage of their location, their thriving local industry and their rapid increase in bulky seaborne trade to emerge as the leading commercial centers in Europe. Nevertheless, by the end of the seventeenth century, Dutch fortunes declined in the face of competition from England and France, as these countries gradually took control over the seas and trade-lanes.

—*Alexander Mikaberidze*

The Columbian Exchange and African Economics and Trade

Separate for millennia, the Old World and the New World evolved distinct ecosystems, each with its own complement of plants, animals, and microbes. The more diverse ecosystem, certainly the one richest in pathogens, was that of the Old World. These ecosystems came in contact in 1492, when Christopher Columbus landed in the West Indies. The European discovery of the New World made the Atlantic Ocean a conduit linking Africa, Europe, and Asia on one side of the Atlantic with the Americas on the other side. Columbus, unwilling to believe that he had discovered a new land, nonetheless furthered the transfer

of people, animals, plants, and microbes across the Atlantic in what historian Alfred Crosby has called the Columbian Exchange.

By 1500 farmers in sub-Saharan Africa were growing corn, a crop indigenous to southern Mexico and the Yucatan. A source of carbohydrates, corn became a staple in the diet of people throughout Africa. In the sixteenth century cassava followed corn to the Old World. It was valuable because it grew on land too poor for other crops, and it became a rich source of calories. Another source of calories was the potato, an American transplant grown in Africa after 1500. These starchy foods fed Africa's growing population. Peanuts likewise were transplanted from the New World to Africa. A valuable source of protein and fatty acids, peanuts enriched African soils with nitrogen. By the nineteenth century peanuts had become an export crop in many areas of Africa. African-grown peanuts found buyers back in the Americas and in China, where they were a popular garnish. Beans from America likewise provided Africans with protein and enriched the soil with nitrogen. Tomatoes and peppers gave Africans essential vitamins.

The flow of crops was not one way. Although the rice farmers in South Carolina tried Asian cultigens, by 1690 they settled on a variety of rice from Madagascar. As was true of peanuts in Africa, rice was an export crop in North America. Buying slaves from lands where rice was a staple, the planters in South Carolina used slaves both for labor and for their knowledge of rice culture. Coffee spread from Africa to Central and South America, where it was, like the peanuts in Africa and rice in North America, an export crop. Sorghum was another African transplant. Although it never rivaled corn, farmers planted sorghum in the American Midwest until soybeans, an Asian cultigen, replaced it.

The demand for slaves to work the plantations in temperate and tropical America stoked the slave trade, which was part of the Columbian Exchange of people. Some 10 million Africans crossed the Atlantic to the Americas. Large numbers died during the Middle Passage, though those who survived brought plants, animals, and pathogens with them. The Amerindians, having evolved in an ecosystem isolated from Old World pathogens, died in catastrophic

➤ AN UNORTHODOX OPINION—CORN IN PRE-COLUMBIAN AFRICA

In 1953 M. D. W. Jeffreys, using linguistic analysis, proposed that farmers grew corn in Africa before Christopher Columbus's birth. He believed that Arabs and Africans had established contact with the Americas as early as 900 CE. From the Americas, Africans or Arabs imported corn to Africa long before Columbus's epochal voyages. Jeffreys's evidence came from the Yoruba region in which historians there speak of a "yellow-skinned foreigner, who crossed the Niger from the north-east," as being the person who introduced maize. Records also show that "the Kesi were the first to cultivate maize and that their king, Ojoko, decreed that no maize was to be sold to surrounding tribes unless it had been killed for planting by being first soaked in warm water and then dried in the sun." Finally, Jeffreys states that he did not find any evidence that maize reached the Yoruba from the coast, which would have been the scenario if the Portuguese introduced it.

Many scholars have dismissed this theory, especially anthropologists who have found evidence of pre-Columbian corn husks in the Americas but not anywhere else. Those who disbelieve Jeffrey's hypothesis theorize that he misread the sources, mistaking native African plants for American maize.

numbers when exposed to smallpox and other Old World diseases. The arrival of Africans in the New World exacerbated the spread of diseases, for Africans brought with them yellow fever, a mosquito-borne disease; yaws, a bacterial infection; and other pathogens. These diseases killed Europeans as well as Native Americans, causing a shortage of labor. Europeans responded by importing an ever larger number of slaves from Africa. The flow of diseases was not one way. Pathogens crossed the Atlantic to Africa. Although there is some debate about its origins, the majority of scholars believe that syphilis, a venereal disease, originated in the

Americas. Sexual contact between whites and blacks spread the disease to Africa. Yet its resemblance to yaws makes syphilis difficult to pinpoint in Africa with certainty.

Animals appear to have made a smaller impact on Africa. From America, Africans imported the turkey, the guinea pig, the llama, and the alpaca, though none of these animals became a major source of food or, in the case of the llama, a beast of burden. Rather, Africans continued to rely on Old World cattle, sheep, pigs, horses, and other animals in their daily lives.

Before the Columbian Exchange, Africa was linked to the global exchange via the Muslim traders who led their caravans across the Silk Roads, the trade route that linked Asia to Europe and North Africa. Rather than beginning the trade link, the Columbian Exchange intensified the trade link between Africa and the rest of the world, as the European ships could not carry African products at a higher and faster rate. Farming aside, Africans mined gold, iron, and copper in Rhodesia, Zambia, and Katanga. Merchants traded these metals as well as ivory across the Indian Ocean for glass beads and textiles. In 1481 the Portuguese, determined to usurp the Muslim traders, established a fortress at Elmina on the Gold Coast in hopes of getting gold from the Ashanti mines. By then the Chinese were trading porcelain across the Indian Ocean for gold. Its commerce extending west to the Americas and east to China, Africa participated in a global economy long before the term became fashionable.

Other European nations followed Portugal, dividing Africa among them in the nineteenth century. During the colonial era, Africa produced raw materials and export crops for Europeans in an economy that enriched Europe and impoverished Africa. The retreat of the colonial powers in the twentieth century did little to change the economy. Africa has remained a producer of peanuts, petroleum, diamonds, and innumerable other export commodities. In some cases African nations, their land taken by cotton, peanuts, or another cash crop, must import food to avert famine. The legacy of the Columbian Exchange has left Africa among the poorest regions in the world.

Economic Effects of Portuguese Expansion into East Africa and the Omani Conquest of Zanzibar

The Portuguese disrupted the centuries-old pattern of east-west trade when they chartered a maritime trade route to Asia. They undercut the hitherto established trade between East and West via the Red Sea and the Mediterranean. Mercantile capitalism, which had gravitated around the Mediterranean, then switched to Portugal and later on to other European nations. Economic effects of Portuguese expansion into East Africa were felt by both Asians and Europeans. It was part of a process that turned a small nation in the Atlantic into a leading market for tradable goods. The Portuguese entry into the Indian Ocean was the first step toward integrating African trade within the world economy under Western control. Large areas of the African coast and the Arab world became integrated into the world capitalist system. This resulted in a decline of trans-Saharan economic relations between Arabs and Africans.

Vasco da Gama first made contact with East Africa in 1498 during his voyage to India. In 1499 Pedro Alvares Cabral explored Sofala and Kilwa, the center of the East African gold trade. In East Africa, the Portuguese wanted to maximize the acquisition of wealth as quickly as possible. The Estado da India (State of India), created in 1505, connected the Portuguese enclaves in the Indian Ocean. The Estado, a maritime trading empire east of the Cape of Good Hope that was subject to the viceroy of Goa, provided security for the factories as well as bases for the Portuguese fleets. They also gained control of East Africa's gold. The Portuguese exchanged pepper from India in return for East African gold and also silver and copper from Europe.

King João III issued a *regimento* (official instructions) in 1530 in order to tighten up trading activities on the East African coast. The *regimento* also aimed to regulate life in the fortress and even relationships with the East Africans. By this time, however, the major profits were made not in gold but instead in ivory. Ivory was bulky, and several coastal *feitorias* (trading factories) were needed, resulting in partnerships between the Portuguese and the Swahilis. During the mid-sixteenth century the Portuguese set up a trading network extending from Delagoa Bay (south of Sofala) to Mombasa. They also brought back into play abandoned factories, such as those in Kilwa. This activity led to friendships with old enemies, such as in Madagascar, where ivory began to be traded instead of gold. New trading bases were established in islands (Zanzibar and Pemba) and also down the East African coast, the most important being Delagoa Bay, developed in 1545. Although the Portuguese had a royal monopoly on trading ivory, it could

➤ PEDRO ALVARES CABRAL

Pedro Alvares Cabral (1467–1520) was a Portuguese nobleman chosen to command a fleet of 13 ships that sailed to the East in March 1500 to follow up the initial contacts made by Vasco da Gama's voyage. Cabral's fleet included 1,500 men and was captained by those carefully chosen such as Bartholomeu Dias, João de Sá, Pero Escolar, and Nicolau Coelho. Cabral was blown off course and accidentally discovered Brazil on April 23, 1500, while on the voyage to India. Resuming his voyage on May 2, he rounded the Cape of Good Hope and reached the Ilhas Primeiras, north of Sofala on Africa's east coast. He sailed farther north to Mozambique, where he obtained water, other supplies, and also a pilot to guide him up the coast to Kilwa, the main city in East Africa at that time, where Afonso Furtado was sent ashore to negotiate a treaty with the king. At Melinde, Cabral found a pilot to direct him to India. Although settlements in Brazil were established only 30 years after those in Africa and Asia, Cabral's discovery of another continent provided the platform for a Portuguese empire in the Americas and spread its influence in both hemispheres.

—Shihan de Silva Jayasuriya

not curtail private trading. Many Portuguese deserted the official empire and mingled with the East Africans, intermarrying and forming local trading networks.

In 1508 Afonso de Albuquerque captured the ports of Muscat, Sohar, and Karyat, but the Portuguese were expelled from Oman in 1650. The Portuguese gained control of Zanzibar in 1500 but in 1698 were ousted by the Omani Arabs. Portuguese control of East Africa was a major drawback to the Omanis, but by 1700 the Omanis took control of the East African coast up to Kilwa and Zanzibar. By the early eighteenth century the area from Mogadishu to Ruvuma was under the dominion of the imam of Oman. Until 1744 when the Al Bu-Said family became the rulers of Oman, its control of East Africa was hindered due to wars within Oman. East African towns were under *walis* (governors) who were almost independent rulers.

Songhai Commerce

Trans-Saharan trade in gold, horses, salt, and slaves had a long history before the rise of the Songhai empire. Some trade may have trickled sporadically across the Sahara in Roman times, but the trade became regularized and institutionalized only after the large-scale adoption of the Arabian camel in the Sahara. Although camels were used in Mediterranean Africa from the early centuries CE, the growth of substantial regularized trade across the desert was accelerated after the camel-borne Arab conquest of the Maghrib in the eighth century. With the burgeoning of trans-Saharan trade, a series of large empires that controlled the trade emerged on the edge of the desert. First the Ghana empire (ca. 750–1060) and then the empire of Mali (1240–1460s), succeeded by the Songhai empire (1460s–1591) dominated the western Sudan from about 200 miles

(320 kilometers) southeast of the great bend of the Niger west to the Atlantic Ocean. Although the basic strength of all these empires derived from the large armies of spear-wielding infantrymen (Ghana is estimated to have been able to field up to 200,000 troops), all of these empires needed horses to arm their much smaller but more mobile troops of shock cavalry.

Songhai, a very warlike empire in the west African savanna (latter half of the fifteenth century through the sixteenth century) required a constant supply of horses to maintain its powerful army. These animals could only reach Timbuktu and Gao, Songhai's chief cities, after crossing nearly 1,000 miles (1,600 kilometers) of the Sahara. These Berber horses, rather small in comparison to European war horses, were raised in the western Maghrib north of the desert and then driven south across the great wasteland to serve as mounts in the Songhai cavalry. The horses traveled with camel caravans that must have carried extra water and fodder for the horses from oasis to oasis. The horses were expensive, and to pay for them the rulers of Songhai sent north principally gold and slaves. The going rate of exchange was one horse for 40 slaves.

In addition to the gold and slaves, caffeinerich kola nuts as well as ivory and ostrich feathers also were shipped north. The Berber merchants brought to the south steel swords, wheat, olive oil, wine, religious books, and Muslim scholars in addition to horses. Dates and salt were products of the desert, which the traders brought to the cities of Songhai. The dates were the chief food eaten by the traders on the desert caravans. The merchants of Timbuktu and Gao sent most of the salt into the forested highlands, from whence most of the gold was obtained. The natives of these gold-producing regions valued the salt highly, and it was often worth its weight in gold. Slaves, sent hundreds of miles away into the desert by the rulers of Songhai, mined the salt at deposits there.

It has been estimated that more than 6,000 slaves from Songhai were sent north along the desert route each year, but we do not have an estimate of the number of horses sent south. It has also been estimated that a ton of gold was sent to northern Africa each year during the fifteenth century and the early years of the sixteenth

century. After the early years of the sixteenth century, slaves replaced gold as the most important commodity because Portuguese traders in the ports on the Guinea coast were by that time able to obtain a large part of the west African gold production.

The slaves who were sent across the desert were obtained by purchase of prisoners of war or of captives caught by slave raiders. Unlike in the Atlantic slave trade, young women outnumbered males in the trans-Saharan trade. The women were to be used in domestic service, as concubines, or in the prostitution industry. Of the males who were trafficked, many were boys who would be castrated to serve in the harems of the rulers and the wealthy classes. Many of the young men were bought as recruits for the armies of Morocco, Egypt, or other north African states.

Other more prosaic commodities were traded on the desert route. Bales of goatskins were obtained from the seminomadic herdsman of the western Sudan. Taken to Morocco, these goatskins were tanned and sometimes sold as vellum in Mediterranean ports and were often processed as Morocco leather for use in the book-binding trade. Copper ore, mined in the Hoggar Mountains of the Sahara, was sent by camel south to be smelted near Timbuktu and Gao. Much of the refined copper would then be used in those cities to make pots and other containers, but some was also sent down the Niger on dugout canoes to be used to make brass and bronze utensils and objects of art by the forest peoples of the south.

The crossing of the desert required several months of travel, with caravans stopping frequently at the better watering places and oases to rest and recuperate. Traders preferred to travel in large caravans of up to 1,000 camels. Such a large caravan necessitated a carefully chosen route to afford the maximum amount of grazing for the camels and horses and, of course, water holes at not too great distances apart. With some rare exceptions, as when the Songhai emperor Aksia Mohammed (1442–1538) made his memorable pilgrimage to Mecca, the caravans would not be owned by a single trader but instead were owned by a group of merchants. Each caravan was governed by contracts among its constituent merchants, enforceable by Sharia

law. The caravans would start in the fall or winter when the weather was coolest but even then would travel at night and rest during the heat of the day. At the end of the journey (to Cairo, Tlemcen, Marrakech, or Fez) the caravan would break up. A return journey would not usually be attempted until the next year, when a new caravan would be organized.

Songhai remained powerful and controlled the lucrative trans-Saharan trade until 1591, when a Moroccan army, using muskets, defeated the much larger Songhai forces at the Battle of Tondibi. The Moroccans were seeking the source of Songhai's gold but found very little. Songhai was destroyed, but the trans-Saharan trade revived in a diminished form.

Gujarat—Indian Imperialism on the Coast

Gujarat was famous for its trade in spices, textiles, and indigo in the premodern world, forming a key node in the nexus of the thriving Asia trade. As early as the sixth century, cosmopolitan port towns such as Valabhi attracted traders from as far as the Arab lands, east African regions, and the Chinese and Indonesian coasts long before any European presence in the region. By the fifteenth century, people of many religions had settled in Gujarat. Local, regional, and central rulers legitimated their sovereignty by mutual tolerance of diverse faiths and the adaptation of their forms of rule to merchants' interests regardless of local beliefs. One can discern an increasing concern for coastal ports by central rulers and thus a political economy of mutual dependency between traders and rulers through most of Gujarat's history. Until 1750,

➤ EAST INDIA COMPANY

Through the sixteenth and seventeenth centuries, the East India Company set up factories in coastal towns across South Asia. Thomas Roe, an ambassador from England, was sent by King James to the court of Jahangir in 1615 in order to secure protection for the English factory at Surat, established in 1613. Once protection was secured, more trading stations were set up by the English in inland towns. The English used these factories to purchase export goods such as textiles, spices, and indigo, which

were shipped across the sea for sale in England. Over the next two centuries the East India Company secured the monopoly over the sea, and Gujarat's textiles became de-industrialized. Raw cotton was exported from Gujarat to England, and manufactured cloth was returned for sale in Gujarat. Gujarat's economy was thus subordinated into a vast network of imports and exports, which by 1857 was officially called the British Empire.

some of the world's greatest producers of cotton, for example, were located in the western ports of South Asia. Throughout its history, Gujarat's industry became world famous through the interaction of diverse communities, whose riches fueled the ambitions of imperial rulers.

The Delhi sultanate had a brief dominion over this land, which they first called Gujarat, during 1297–1402. The source of state revenue included taxes on trade in addition to agrarian revenue from both coastal and inland trade routes. Within the Delhi sultanate, to be governor of Gujarat was a highly sought-after position. The governor secured his position by his

ability to promise safe roads and infrastructure in exchange for a portion of the trade. By 1390, however, revenue stopped coming to the center at Delhi. Gujarat had broken from the Delhi sultanate, exemplifying the long pattern of conflict between regions and centers in the Indian subcontinent's history. Sultan Ahmed Shah of the new Gujarat sultanate made his capital at Ahmedabad in 1411. In the 1480s the Gujarat sultanate expanded its dominion north into southern Rajasthan and southward to Bombay (present-day Mumbai). Christopher Columbus's expedition of 1492 was prompted by Gujarat's contribution to the spice trade of the so-called Indies, which in his time included all of South and Southeast Asia. His accidental discovery of the New World set various European powers into a competition for the Indian Ocean. The Portuguese, Dutch, French, and English all settled on Gujarat's coast through the course of the fifteenth through eighteenth centuries, competing for their share of Gujarat's riches.

Gujarat appealed to the Mughals (1526–1857) of Delhi both because of Gujarat's commercial wealth and its convenience on the pilgrimage to Mecca, the *hajj*. During this period the imperial narrative of successful Mughal expansion becomes questionable when seen from Gujarat's perspective. In 1535 Humayun launched a campaign to capture Gujarat but failed to annex the kingdom. Akbar, Humayun's son, finally succeeded in 1574, turning Gujarat's port of Surat into the Mughal port for the *hajj*. But within three months of annexation the nobles of Gujarat attempted to drive out the Mughals. The

regional nobles briefly occupied Cambay, Surat, and other major seaports. Akbar was eventually triumphant, however, and political rule of Gujarat became one of Akbar's famous triumphs. Domination of Gujarat was thus achieved with difficulty and was repeatedly contested by regional sultans through the seventeenth century. By the eighteenth century the Marathas rose to power by sharing rights over land revenue with the Mughals, while the English fortified coastal factories and increased their share in the sea trade. Gujarat was divided into subregions of Maratha, English, and Mughal rule during the eighteenth century, after which the British triumphed as the imperial masters of both the land and the sea.

Linchpins of the East Asian Economy—Ryukyu and Malacca

The archipelago of Ryukyu (Okinawa) between Taiwan and Japan and the port city of Malacca (Melaka) on the Malay Peninsula were two of the most vital maritime trade centers of Southeast and eastern Asia from the fifteenth century until the seventeenth century. They gained their prominent positions as a consequence of the seclusion of Ming China since the 1430s and Tokugawa Japan since 1633. When state-run maritime trade was abandoned and private overseas trade prohibited, marketplaces were required that offered indirect connections. Therefore, Ryukyu offered anchorages near the shores of China and Japan as well as close cultural and political ties to China's and Japan's spheres of influence. Malacca maintained frequent relations to China and provided a key position among

the Indian Ocean, Malayan archipelago, and the South China Sea.

Chinese sources increasingly mentioned Ryukyu as early as the mid-fourteenth century. Following private intermittent contacts, closer relations to the Ming dynasty in the form of tribute missions started in 1372. During this time Ryukyu was divided into three smaller kingdoms (Chung-shan [Chuzan], Shan-nan [Sannan], and Shan-pei [Samboku]), which were unified under the rule of Sho Hashi (1372–1439). The ruler of the following Sho regime, formally confirmed by the Ming emperors, controlled the maritime trade and institutionalized tribute missions. For this reason China regarded Ryukyu as a “maritime paragon.” Even the Ming permitted a limited but continuous settlement of Chinese families in Ryukyu. This caused long-term contacts and an increasing cultural orientation to China among the elites. The economic orientation toward China was based on the formal tribute relations that were extended to semiprivate trade under a regime of fixed prices. Ryukyu's traders were permitted to visit all Chinese ports, and often China provided vessels for their shipment.

Since the beginning of the fifteenth century Ryukyu also established contacts with Japan. Records mention several missions to Kyoto and voyages of trading vessels to Japanese ports. Because of its intermediary function, Japan claimed power over the islands. The shogun awarded Ryukyu to the daimyo of Satsuma, which initially meant that he had supremacy over trade. In 1609 Satsuma conquered Ryukyu. The kingdom became a tributary of Japan as well; however, its formal annexation as a province (*han*) did not occur until 1872. During the second Sho dynasty (1470–1872) Ryukyu kept a certain amount of autonomy, which was guaranteed by a strict separation policy by Japan's administration.

This kind of dual subordination to Japan and China enabled Ryukyu to keep its economic advantages alive and also maintain its function as a center of maritime trade. This guaranteed commercial contacts between Japan and China and long-distance routes to Korea and Southeast Asia. Formally Ryukyu's trade was incorporated in the system of tribute mission, but in practice it was carried out by free merchants. These could

➤ RYUKYU'S HORSE TRADE TO CHINA

Imperial China traditionally imported horses for its armed forces and as symbols of economic and political power. China depended on these imports, which mostly came from Central Asia. Additionally, maritime resources became profitable in the middle of the fourteenth century. Ryukyu played a significant role as a lynchpin of maritime trade and, most importantly, as home of a small and tough horse breed. These horses were domestic on the islands around the fourteenth century and were presumably bred for export purposes. Next to sulfur they were the only export product of the islands available for tribute trade to China. Since the beginning of the Ming dynasty, sources talk of varying numbers between 10 and 40 horses a year, occasionally even up to 120 animals. During the first half of the fifteenth century, sources suggest that there was one shipment every year. With the increasing reexport of Southeast Asian products, Ryukyu's horse trade gradually lost its relative importance. During the second half of the fifteenth century maritime horse imports to China decreased, and eventually Ryukyu lost this sector of its commerce. The example of horse trade illustrates Ryukyu's maritime trading position gained from the integration into the Chinese tribute system.

—Jürgen G. Nagel

be indigenous traders, but increasingly Japanese merchants became involved with the Korean trade, and Chinese traders dominated relations with Siam, Java, and Malacca. They obtained royal documents that declared their engagements tribute missions. The main commodities consisted of pepper, cloves, ivory, and several precious and dyeing woods from Southeast Asia that were reexported to China, Japan, and Korea together with commodities like silk and porcelain from China or copper and precious metals from Japan. Korea delivered primarily cotton and Buddhist scriptures for use in Ryukyu. Export commodities from Ryukyu were scarce and primarily consisted of sulfur and horses.

The port city of Malacca was founded by a noble refugee from Palembang during the very first years of the fifteenth century. Primarily a tributary to Siam, Malacca sought Chinese

protection with the first expedition of Zheng He during 1405–1407. That relationship was the first pillar of Malacca's rise to a regional power and an emporium of supraregional importance. The second pillar was built by intensive commercial relations to South Asia. Indian merchants were attracted by several measures including taxation and tariff policies. Consequently, several trade diasporas, especially Chinese and Gujarati, established communities during the fifteenth century. They received an autonomous status in terms of self-government, jurisdiction, and commerce and gained significant influence in policy and economy. Additionally, the connections to the West were strengthened by Islam, which was imported from India and accepted in Malacca around the 1510s. Furthermore, Malacca attracted traders from the Malay archipelago who provided regional spices, dyeing woods, maritime goods, and forest products. Thus, Malacca was able to connect the trade of India and Indonesia as well as China and—via Ryukyu—Japan and Korea.

As the main emporium of the spice trade, Malacca came under the focus of the Portuguese soon after their arrival in Asia. In 1511 Alfonso Albuquerque conquered the city, set an end to the sultanate of Malacca, and established a Portuguese colonial town. Since the Portuguese *Estado da Índia* had failed to monopolize the spice trade and therefore depended on profits from “licensed” private trade, Malacca succeeded in keeping its role as a trade center. The insidious decline began after the conquest in 1641 by the Dutch East India Company, which finally expelled the Portuguese from Indonesia. The Dutch desire to preserve Malacca's trade character, in particular for Indian and Chinese traders, was thwarted by restrictionist commercial policies based on the company's monopolistic aims. Eventually the Dutch abandoned the private spice trade in their own ports and concentrated its competitors' trade around the Malay Peninsula (pepper, spices, sandalwood, tin, and the principal Indian textiles). This secured a great share of its profits and completely excluded the Indian merchant groups, who then migrated to free ports like Aceh in the north of Sumatra. Most of the China trade was redirected to Batavia. Under Dutch control Malacca was reduced

to local importance only, as it had been in the early fifteenth century.

Despite huge differences, Malacca and Ryukyu shared some crucial characteristics. As emporia they were typical until the eighteenth century for the commercial system of Asia, which was based on maritime trade. They succeeded in integrating a whole trading world that reached from the Arab Peninsula to the Korean Peninsula. Their advantages consisted of their geographical situation, commercial policy, and integration into central cultural contexts (China, Japan, India, Islam). Thus, they were of exceptional interest for European expansionists. In the beginning Malacca and Ryukyu were able to profit from the intensified trade of the new competitors. Yet eventually these developments led to the decline of their status, not only by conquest or marginalization but foremost because of the rapidly growing European country trade since the early eighteenth century.

“Life So Affluent”—Asia’s Great Age of Commerce

The term “Age of Commerce,” a denomination originally coined by Anthony Reid, describes a crucial epoch of Southeast Asian economic history covering the fifteenth to the seventeenth centuries. It started in the context of the short-term opening of Ming China around 1400 and expired at the latest around 1680, when European merchants had gained control over several main branches of trade. The idea of an Age of Commerce can be expanded to all of Asia, whose economic areas were entangled in multiple ways. The nature of the period was formed by Asian as well as European influences. The origins are to be found before the beginning of the European expansion, but European expansion was one of the main activators of its dynamic, ultimately leading to partial European dominance in Asian commerce.

Following Fernand Braudel, three overlapping economic areas characterized pre-European Asia: the Islamic world (the western Indian Ocean, the Red Sea, the Arabia Gulf, and the central Asian deserts), the Indian sphere of influence (the whole Indian Ocean east and west of Cape Komorin), and China (as a continental power on the eastern continent and a maritime power of the western Pacific). With the Age of Commerce these greater regions reached their peak of interrelations. At the same time, the urban centers of exchange at the crossings experienced a unique blossoming. The Age of Commerce brought far-reaching changes to each of these regions. In China a short epoch opened that saw the maritime expansion under Zheng He (1405–1433) and was followed by a period of closure and a policy of licensing selected trading houses in South China for overseas trade during the last decades of the Ming dynasty. Japan did not close its gates for foreign trade until toward the end of the Age of Commerce. In Southeast Asia the era experienced a change from greater kingdoms to smaller city-states. And India experienced the blossoming of the Mughal empire, while the Arabian world was in a period of economic stagnation. The worldwide expansion of European trade is one of the key features of the epoch and delivered a

► TRADE DIASPORAS

Networks were the backbone of the far-reaching commercial systems of the Age of Commerce. The networks of the different trade diasporas proved to be particularly sustainable. Their specific characteristics provided both close cohesion and wide dispersion of economic protagonists. Trade diaspora groups featured conjointly a geographic origin (home country), an economic origin (trade), the organization and cognition as a self-contained community in the host countries, continuous interrelations beyond the borders of the host countries, and a real as well as symbolic relation to their place of origin. The core of these interrelational systems was kinship and a common culture or religion. The Chinese were the greatest trade diaspora. Coming mainly from South China, they settled all over Southeast Asia starting in the fifteenth century due to the closure policy of the Ming dynasty. They maintained the trade with Chinese luxury goods on the one hand and South-

east Asian products from the forest and the sea on the other hand. The Armenians were the trade diaspora with the geographically widest network covering all of Asia except Japan. In the beginning of the seventeenth century the Persian shah displaced them from their home country and settled them around their new center, New Julfan. From there they built up a trading network connecting even Europe with East Asia. Additionally, several Indian groups played an important role during the Age of Commerce: first of all the Muslim Gujarati as traders between the Indian textile centers and the Southeast Asian port cities, the Hindu Baniyars with comparable functions in central Asia, and the Hindu Chettiers from southern India who developed a focus on money exchange. All of these groups were the most important middlemen and trading partners of the European newcomers during the first decades of the seventeenth century.

—Jürgen G. Nagel

central contribution to the integration of Asian and world markets.

Asian trade covered a vast range of commodities. The base built commodities of everyday life. During this time foodstuff, especially rice, was the greatest quantity. But some very specific cash crops and luxury goods were responsible for the boom that constituted the Age of Commerce. Cloves and nutmeg had been well-known luxury goods since antiquity, even in Europe. But their main markets were to be found in China and India. The main areas of production were situated in the Malay Archipelago: cloves on the northern and central Moluccas and nutmeg primarily on the Banda Islands in the south of the Moluccas. Medieval Europe covered its demand via the Silk Roads and the eastern Mediterranean. The establishment of the sea route by the Portuguese, followed by English and Dutch companies, fueled demand and production dynamically but was not causative for market-oriented spice production in Southeast Asia. Coming from India, the growing of pepper spread rapidly to new areas during the Age of Commerce, particularly to the west coast of

Sumatra. Pepper production was scattered over a much wider landscape than other spices and was the most important luxury good in terms of trade volume.

Beside foodstuff, textiles provided the main products in Asian trade. The majority was produced in traditional Indian textile centers (Bengal, Coromandel, Malabar). Additionally, India exported cotton as a raw material. From China and Persia, silk and silk products were provided to the Asian as well as to non-Asian markets. Textile production was also domestic in Southeast Asia (e.g., batik from Java) but proved to be not saleable in other parts of Asia. For the Europeans, Asian textiles were the crucial product to exchange for precious metals in their balance of payment. Thus, textiles built up the heart of the European trade.

European merchants were forced to participate in the Asian trade by their biased balance of payment due to the low marketing opportunities for European products. Precious metals, especially silver from the Americas, were the only medium of exchange in Euro-Asian trade before the use of opium in the eighteenth century.

Thus, the participation of European merchants in inner-Asian merchant structures became an integral part of the Age of Commerce.

The so-called Silk Roads built up the central axis of the long-distance trade. Caravans through central Asia provided the majority of luxury goods from Asia for Europe. The land-based Silk Roads connected western China with trading centers in central Asia (e.g., Samarkand, Buchara) and farther on with the Levant, where the route ended in Aleppo and Alexandria. But also the maritime Silk Roads played an important role connecting the South China Sea via the coasts of India with the Red Sea and the Arabian Gulf. Furthermore, the route maintained a connection to some parts of eastern Africa, especially at the Somali and Swahili coast. The structure of transport connections represented a world economy of Asian imprint.

Despite the important role of caravans, the Age of Commerce was primarily an era of maritime trade. The majority of merchant exchange focused on small-scale trade, coastal traffic, and the rivers that offered a wide spread network to the interior. The main types of vessels were adapted to both waterways, which meant that they had a considerable advantage over the European ships. Fully developed streets were lacking in most regions outside of China and Japan.

Early forms of joint ventures and joint-stock companies, which were often highly specialized, became trading partners of the European merchants. The most established networks of that kind were provided by the different merchant groups, especially the Chinese, the Armenians, and several Indian communities. Most of them provided important networks of money lending and capital transfer. All of them enjoyed public protection in their host countries. At the peripheries of the Asian economy, political decisions, especially the closure policies of China and Japan, hampered trading possibilities. As a result, the more legal trading became restricted the larger the black market grew.

The Age of Commerce is not conceivable without states and rulers following mercantile interests. Governments increased the transaction costs of trade (taxes, protection, etc.) but also established public protection and infrastructure.

The most important examples of this are the city-states of Southeast Asia like Ayutthaya, Malakka, Bantam, and Makassar. These independent port cities served as entrepôts, especially of the dynamic trade in luxury goods, and guaranteed the interrelation of different commercial regions. A comparable role can be observed in the Indian states of the time. The base of that was a free trade policy that allowed all merchant groups, including the European companies, to participate in the market. Nevertheless, the position of the rulers remained a strong one. On the one hand they could restrict or offer market access following their own interests, as the Mughal government did. On the other hand they could participate in person in the market, as did several sultans in Southeast Asia (e.g., Aceh, Bantam). Due to the close entanglement of political and commercial spheres, the decline of political power went hand in hand with the restructuring of Asian commerce at the end of the Age of Commerce.

The Age of Commerce was a period of commercial expansion and increasing intercontinental integration. The period experienced side by side an intensification of commercial exchange in Asia, the growth of cities and states with a commercial orientation, and the integration of Europeans in the Asian economy and of Asian trade in global contexts. The main continuity of the period was the persistence of Asian forms of exchange and commercial organization. The main transformation, however, was the new and increasingly dominant role of Europeans in Asia.

Macao as a Trading Center

Macao (Macau as written in Portuguese or Ao-Men in Chinese) is a small island and peninsula in southern China and was a Portuguese colony from 1557 until 1999. The traditional Portuguese account of their settlement of Macao is that Portuguese sailors helped the Chinese to defeat pirates in the South China Sea. The Ming government is said to have given Macao to the Portuguese out of gratitude for their help. Unfortunately, this account cannot be proved or disproved because many of the documents relating to Macau were lost in the Lisbon earthquake of 1755. What is known is that by 1560, the Portuguese were paying rent to the Chinese for Macao, and several permanent buildings had been erected on the island.

How the Portuguese were able to settle Macao is not as important as the fact that they were allowed to settle there. This was an unprecedented

move by the Chinese, as the establishment of the Portuguese presence there was the closest the Ming government had come to treating foreigners as equals to the Chinese. In fact, no other European power was able to achieve the level of diplomacy that the Portuguese had, though many tried. Macao was different from the other Portuguese settlements in that the Cantonese officials remained in residence on the island, and Portuguese residents paid them hefty sums in order to retain their residence there.

Despite the restrictions, an estimated 500 Portuguese households were settled there. By 1582 a *senado da camâra*, a municipal town council, was established in the Portuguese model, and finally in 1586 Macau was established into a viceroyalty of the Crown. The Portuguese success in Macao is attributed to their role as middle-men between China and Japan. At this time, Chinese merchants were forbidden to trade with the Japanese, as were the Japanese to trade with the Chinese. However, this restriction did not dampen the market for these forbidden goods in each country, and the Portuguese were able to take advantage of this situation. For example, Japanese demand for the silks coming out of China was high, while the Japanese produced more silver than China. A Portuguese merchant living in Macao would typically buy goods in a Cantonese market, load his ship, and take them to Japan, where he would trade them for silver. He would then return to China, where he was usually able to trade the silver for gold, which was sold at a much cheaper price in China than it was in Japan or Europe. It has been estimated that half of Japan's silver production was effectively poured into China during the last half of the sixteenth century.

Macao's Golden Age of trading started to see a decline in 1637 when the Japanese shogun halted all trade with foreigners. In 1641 it saw a further decline when the Dutch were able to capture Malacca from the Portuguese, thus breaking Portuguese dominance in the Asian market. Macao ceased to have any real importance as a trading post after 1685, when the Chinese emperor Kangxi opened up trade to the other European countries, breaking the Portuguese monopoly over the trade in China once and for all.

—Monique Vallance

► THE MACANESE LANGUAGE

Macao's position as a center for trade in Asia was exemplified by the existence of the Macanese language. This language is known as Patuá in Portuguese. Originally this language developed in the sixteenth century as the first Portuguese settlers married women from Malaysia and Sri Lanka, as they did not have permission to interact with the general Chinese population outside of Macau. As time went on, the language evolved to include elements of Japanese, Kristang (the language of Malacca), and finally Cantonese. The language is unique, as it changed in relation to the people who migrated and traded in Macao, much like the ethnicity of the people themselves. The language, which is classified as a Creole language, was the primary language of Macao until 1945, when more Chinese people began settling there after the Communist Revolution. Today the Macanese language is classified as "critically endangered" by UNESCO, and as of the year 2000 it was estimated that only 50 people in Macao still use it as a primary language. Unlike buildings and other artifacts left behind by the Portuguese, the Macanese language is an organic legacy of the Portuguese and their methods of colonization.

The Achean Pepper Trade— Taking the Trade from India

At the beginning of the sixteenth century, the city-state of Aceh (located in modern-day Sumatra) experienced a rapid rise from a local to a regional power and a supraregional entrepôt. Already in the middle of the century its influence covered both coasts of Sumatra. The early Islamization until the end of the thirteenth century enabled Aceh to establish contacts with the Ottoman empire, which provided soldiers, weapons, and military knowledge. This allowed an effective self-defense, including that against Europeans, and a successful military expansion. Meanwhile, local and Indian Muslim merchants and the rise of pepper growing enhanced the sultanate's economic advancement. Today there is a dispute over whether it was Ottoman patronage or Portuguese influence that caused this advancement. Doubtlessly, Aceh successfully used its outstanding political, geographical, and economical position to defend its status during the seventeenth century. Another factor was the centralization of power at the end of the sixteenth century when the dominant merchant oligarchs (*orang kaya*) were oppressed by the sultan in favor of a new elite class that was loyal to the palace. Furthermore, there was a tremendous population growth after 1550. The population doubled in only 50 years and reached 100,000 by 1640. This growth and the special situation as an entrepôt and as a pepper-growing region resulted in a critical dependency on food supplies. Some scholars regard this as a considerable cause for the later decline.

The Achenese success was rooted in the rise of the pepper trade. The immediate hinterland had always been a traditional pepper-growing area. During the 1520s Aceh seized control over this region by incorporating Pedir and Pasai, the most important pepper exporters of Sumatra. Until 1530 the Portuguese largely controlled

the Malabar pepper market, which had supplied Europe since the Middle Ages. In addition, Malacca, the main staple port for spices, was conquered by the Portuguese in 1511. Aceh benefited from this expansion in several regards. Asian merchants were attracted to the port for use as a freely accessible alternative. Traders from the Portuguese settlements on the Coromandel Coast of India especially frequented the port and established their own factories because Indian cloth was preferred over the local products in terms of quality and colors. On the other hand, Aceh occupied large parts of the pepper trade with China. Consequently the Chinese established communities during the seventeenth century, followed by Armenians and Arabs during the eighteenth century. Furthermore, Aceh became an interesting port of call for the new Dutch and English competitors who strived for free markets while avoiding the centers of Portuguese power. By the end of the sixteenth century Portuguese sources mention that 15,000 bahar (2,700 metric tons) of Achean pepper was being exported every year.

At the end of the sixteenth century the first Dutch arrived as representatives of the *voorcompagnien*, the forerunners of the United East India Company (VOC). Between 1601 and 1616 the Dutch ran a factory in Aceh; an English factory existed between 1611 and 1659. The sultans guaranteed the same conditions to these Europeans as they did to Asian traders. Nevertheless, the companies heralded the decline of the Achean pepper trade. In the beginning they tried to avoid the powerful sultanates by heading for centers closer to the producers and avoiding more expensive great entrepôts. In the middle of the seventeenth century the competitive situation was adjusted. The VOC established commercial supremacy in the Malay archipelago, while the English company was widely expelled from the region. Although Aceh remained a free emporium, unlike the conquered competing entrepôts (Malacca, Macassar, and Banten), and despite the growing Dutch supremacy in maritime trade, Aceh's influence eventually diminished. It abandoned pepper cultivation on its own heartland after the loss of Tikou and Pariaman to the Dutch in 1663. Fixed prices, production quotas, and frequent threats of force made

► ISLAM AND TRADE

The economic and political rise of Southeast Asia's port cities went hand in hand with the spread of Islam in the region. Aceh, as the first Indonesian state that accepted the new faith, provides a striking example for the mutual relation of religion, commerce, and power. For the local rulers, conversion provided a series of advantages. In times of conflict they counted on support of religious brethren in the great powers like Mughal India or the Ottoman empire. The Islamic state philosophy offered them the legitimization to concentrate power and establish a more effective administration of the port as well as better financial benefits from the trade. Otherwise, Islam transported the idea of free merchants and free trade, which characterized Southeast Asian port cities before colonization and allowed the continuous establishment of several merchant communities of high influence. The concrete administration was del-

egated to the habormasters (*shabandhars*), mostly officiated by members of foreign merchant communities, especially Chinese or Indians. Again, this was based on Islamic law, especially the maritime legal codes following the regulations of Malacca. In Aceh during the seventeenth century, four courts sat regularly. One of them dealt with questions of debt and inheritance, and another specialized in commercial disputes between merchants. Next to concrete maritime regulations, the commercial law concerned credits, bankruptcy, borrowing, and trusteeship and was based on Islamic rules. The acceptance of the Islamic religious and legal system allowed the sultans to shape an open but well-controlled entrepôt. This attracted private merchants, both Muslim and non-Muslim, as well as European companies during their first decades of establishment.

—Jürgen G. Nagel

pepper exports barely profitable. Some domestic troubles led to the enthronement of four queens instead of the male sultans, which weakened the state collaterally. Economic changes during the eighteenth century introduced new products (tin, opium, coffee, tobacco, sugar), more freedom on the markets, and new participants. Aceh especially benefited from the English trade; furthermore, it was able to reestablish the pepper trade at the end of the eighteenth century. The first new customer of Achean pepper was a private company at Sibolga established by the British officials of Bengkulu. That business became the impetus for new cultivations in the interior of Sumatra, which increasingly found customers on American ships calling at Aceh. The basis of the greatest cash cropping system and the most important pepper provider of Southeast Asia during the nineteenth century was established.

The Spice Islands in Southeast Asian Trade

Today the Moluccas, tiny volcanic islands in eastern Indonesia, seldom make international news. Five hundred years ago it was a different story. The "Spice Isles" were the only source of cloves, nutmeg, and mace and the setting for an intense commercial competition. This battle to control the production and trade in these valuable commodities was a ruthless and violent conflict fought with great cruelty. Europeans, drawn to

the area by the lure of spices, were quite willing to enslave, torture, and kill both the indigenous populations of the Indies and other Europeans in order to achieve their political and economic goals. The struggle for the Spice Islands profoundly changed not just local societies but also the history and economy of the world.

The sparsely populated Spice Islands are located far from international markets. But according to archaeologists, as early as 1700 BCE cloves were exported as far afield as Syria. The demand for cloves (the dried flower buds of a tree native to a few islands around Ternate and Tidore), nutmeg, and mace (parts of a fruit found exclusively on the Banda Isles) fed high prices and prompted voyages across the globe in order to secure reliable supplies. These spices were used in medicine, in food preparation (both as a flavoring agent and as a preservative), and as a status symbol. Long-standing trade networks brought these commodities to India, China, and the Middle East, with Asia remaining the biggest market even after Europeans directly entered the trade in the sixteenth century. Spices would reach Europe through Constantinople, Aleppo, Cairo, and Alexandria through Venetian

middlemen. The trade centers of Srivijaya, which controlled the Straits of Malacca from 600 to 1000 CE, and the Javanese empire of Majapahit grew rich off access to the Moluccan spice trade. (The fourteenth-century visitor Friar Odoric was so struck by the quantity of spices for sale in the latter that he assumed they grew there.) The quintessential Southeast Asian trade emporium was Malacca, which for the whole of the fifteenth century, and under the tributary protection of China, grew rich by acting as a meeting place for networks of Asian spice merchants.

It may have been rumors of the great wealth accumulated at Malacca that brought the Portuguese into the Indian Ocean in 1497. In trying to set up a direct sea route for spices, the Portuguese were driven by the desire for profit and by religious zeal. Success in monopolizing the spice trade would bring great wealth into Portugal and would strike a blow against the Islamic powers, who up to this point had dominated the Indian Ocean. This Portuguese effort was a royal affair, the fleets sent out to seize control of trade networks were financed by the Crown, and it was the Portuguese viceroy Affonso de Albuquerque who began constructing a maritime

► TOMÉ PIRES AND THE *SUMA ORIENTAL*

In 1512 Tomé Pires, an apothecary from Lisbon of nonnoble background but with connections to the royal court, arrived in Goa. The viceroy Albuquerque was so impressed with his credentials that he put Pires in charge of the newly won trading port of Malacca. While there Pires settled mercantile disputes and became wealthy through trading in spices. After trips to Sumatra and Java, he wrote down his findings in a monumental work, the *Suma Oriental*. Unfortunately, the Portuguese were very protective of their new Eastern possessions and went to great lengths to conceal the exact route from Europe to Asia; the death penalty was enforced for the publication of any written account of their overseas empire for the whole of the sixteenth century. Although parts became known, Pires's book was not actually published until 1944. *Suma Oriental* is both encyclopedic in scope and very thoughtful in its observations. Although it is certainly biased in terms of its worldview, it is an

invaluable primary source for historians researching the early years of the European presence in Southeast Asia. The book outlines the sea route to Malacca, the politics of Southeast Asia, and local peoples and customs. Malacca and its downfall are described, and the cosmopolitan trading port is compared unfavorably to pious Portugal. Pires quite consciously sees the world through the lens of religious differences. He details the spread of the rival religion of Islam and assumed that the "heathen," Hindus and animists, would be interested in converting to Christianity, although in the meantime he noted (and generally disapproved of) their customs. As for Pires himself, in 1517 he led an ill-fated diplomatic mission to China. Cultural misunderstandings led the emperor to order the execution of the entire delegation, although there is some evidence that Pires himself died in wealthy obscurity after marrying a provincial Chinese lady.

—Michael Wood

empire through the establishment of a series of strategic bases across the Indian Ocean. The most important of these was Malacca, captured in 1511. Its fall was followed up with a direct voyage to the Moluccas in 1513. On the eve of the European arrival the population of the Moluccas had lived in relative isolation, despite long trade links with various Asian centers. The inhabitants of these islands had so prospered from the spice trade that they no longer needed to grow food and could instead import whatever rice and fish paste they needed. The Moluccas were organized into loose kingdoms and were mostly animist, although many of their rulers were recent converts to Islam. The Portuguese newcomers soon became involved in local political intrigues as they founded a series of forts. Although firearms had long been known to Asians, high-quality ship-mounted cannons gave the Portuguese a decisive military edge.

However, in the long term the Portuguese enterprise was a failure. Asian merchants, put off by Portuguese aggression and a propensity to demand conversion to Christianity, simply did business elsewhere. Muslim traders shifted operations to Aceh, Banten, Jambi, and other friendly ports. The royal monopoly on trade to the Moluccas was steadily eroded, and the Portuguese found that there was little local demand for Portuguese products; spices had to be either taken by force or paid for with cloth purchased in India. It was eventually found to be more profitable to make alliances with Asian merchants. By the mid-sixteenth century the Portuguese had become part of the Asian trade system, with Portuguese ships carrying local cargoes and with the gradual loss of control of such territories as Malacca. The Portuguese presence did have one notable legacy. Such missionaries as the Jesuit Francis Xavier succeeded in winning many converts; to this day the inhabitants of the Moluccas, while sharing a common local identity, remain divided into Muslim and Christian communities.

The Spanish felt that the Moluccas had been assigned to them in the 1494 Treaty of Tordesillas, in which the pope had divided the non-Christian world into Spanish and Portuguese spheres of control. After some physical clashes, the Spanish relinquished their claims in return for a large cash payment. However, the colony

they established in the Philippines did have some importance for the trade in spices; Manila attracted Chinese merchants interested in buying and selling these and other Asian products, with the whole process financed with Mexican silver.

English attempts to gain a footing in the lucrative spice trade were ultimately unsuccessful. In 1623 the Dutch executed ten English merchants in an incident described by the British as the Ambon Massacre. Similar setbacks in the western Java ports of Jayakarta (present-day Jakarta) and Banten eventually forced the English East Indies Company to abandon its involvement in the Indies to concentrate on bases in India. (Initially set up to facilitate the trade in cloves, nutmeg, and mace, these Indian centers formed the basis of the British Empire in India.)

Like the English, the Dutch were private traders sponsored by the state. A process of consolidation had created the Vereenigde Oost Indische Compagnie (United Dutch East Indies Company, or VOC), a joint-stock company given an extensive charter to buy, sell, and make war. Dutch activities in Asia were part of a commercial rivalry with Portugal that intensified once the Crowns of Portugal and Spain became unified. This meant that the Portuguese were now a part of the Dutch political struggle with Spain, which they were fighting for independence. After capturing the Portuguese forts in Ambon in 1605, they set about trying to monopolize spice production. In 1621 the Banda Isles were captured. Soon after the Dutch governor-general Jan Pieterszoon Coen ordered the massacre of most of the local population so that the islands could be turned into Dutch plantations to be worked with slave labor. Over the course of the next 60 years Dutch raiding parties uprooted spice trees and prevented any local trade in these commodities, which the Dutch saw as smuggling. This led to a great deal of slaughter and starvation. By 1667, with the capture of the port of Makassar in Sulawesi, the Dutch can be considered to have gained full control over the spice trade. (Although ultimately because of the vast distances involved that made it impossible to calibrate supply with actual market demand, poor-quality personnel and institutional corruption, and a heavy involvement in Javanese politics, the company went bankrupt in 1799.)

The failure of the Dutch to turn a profit after they had obtained the monopoly that so many had died for is one of the many ironies of the history of the Spice Islands. Another is that changing tastes and technology eventually greatly reduced demand for these products and their value. Cloves and nutmeg were successfully transplanted elsewhere. Spice production is negligible in the Moluccas today; Indonesia is in fact the world's biggest importer of cloves (used in *kretek* cigarettes).

Centralizing the Siberian Fur Trade

Russian penetration of Siberia occurred not long after the conquest of Kazan in 1552 and Astrakhan in 1556. Russian peasants, traders, Cossacks, and explorers began to cross the Volga and Ural rivers for a variety of reasons, not the least of which was to tap into the lucrative fur trade. Much of this had been controlled for centuries by the various Tatar khanates, successors to the Mongol empire that stretched across Eurasia. As the Russians moved into Siberia, their attempts to take furs ran contrary to the desires of the Sibir khanate, from which Siberia takes its name, located in the Irtysh River basin.

The driving forces that opened up Siberia were the commercial efforts of Grigori Stroganov whom Ivan IV (1530–1584) awarded 9 million acres (3.6 million hectares) of land concessions around the Kama River, a tributary of the Volga. Stroganov and his family held an autonomous fiefdom, answerable virtually to only the tsar. A decade later, in 1568, Tsar Ivan doubled the Stroganovs' territories. Most of this

territory, however, was also claimed by the Sibir khanate.

Sibir raids on the easternmost frontiers threatened to drive the Russians back across the Volga River. The Stroganovs joined forces with Cossack adventurers led by Yermak Timofeevich. The Cossacks led by Yermak were analogous to conquistadors like Cortes and Pizarro. Initially hired to protect the Stroganov frontiers, Yermak was also an opportunist. He campaigned against the Sibir Tatars from 1581 to 1584, and the Russians emerged victorious although Yermak died, drowning under the weight of armor he plundered from the Sibir.

The defeat of the Sibir opened the rest of Siberia to the Russians. With only small tribes and little organized resistance, Cossacks reached the Okhotsk Sea by 1637. Along the way, they established forts known as *ostrogs* and assumed control of the fur trade. For the most part it was a simple process. While the Tatar khanates received furs as tribute from the various Siberian tribes, the Russians filled the vacuum caused by the destruction of the Sibir. In the easternmost reaches of their new empire, the Cossacks even competed with the Qing empire for furs in the Amur River valley of Manchuria.

With the domination of Siberia, furs quickly became one of the most important sources of revenue for Russia, at some points comprising 30 percent of the state revenue. Indeed, furs were popularly known in Europe as "Russian Gold." The government became the primary participant in the fur trade, possessing a near monopoly on it, and acquired furs through a variety of means. The primary way was as tribute or through taxes from the indigenous population. They also collected a 10 percent tax of the highest-quality furs from Russian trappers as well as buying the best furs from both natives and Russians. By the end of the sixteenth century, the treasury received 200,000 sables, 50,000 squirrels, and thousands of fox, beaver, and ermine pelts per annum. This wealth also paid for administering the Siberian territories.

While the state benefited from the trade, Russian expansion into Siberia had dire ramifications for the region. The demand for Siberian furs in Europe and the Qing empire made the trade too lucrative to ignore or consider the long-term

COSSACKS

Who were the Cossacks? The first Cossacks were Tatars who had broken off from the main khanates for a variety of reasons. Gradually they merged with Russian settlers who had remained on the steppe from the Mongol period. Russian peasants also joined them as they fled from increasing restrictions imposed on them in Muscovy. Gradually a syncretic culture of sedentary and Turko-Mongol steppe life emerged around the rivers from which they received their names, such as the Yaik and Don River Cossacks.

During Muscovy's and later Imperial Russia's expansion, the Cossacks had a tenuous relationship with the state. They viewed themselves as independent, whereas the Russian government viewed them as clients. Nonetheless, the Cossacks maintained much of their independence even as they played a key role in Russian expansion into Siberia. Like many of the explorers in the New World from western Europe, they often explored, conquered, and exploited without the knowledge of the state but eventually received recognition from the state if they were successful. At other times the state disavowed any relation, such as when the Cossacks in Siberia started a border conflict over the fur trade with the Qing empire with which the Russians hoped to sign favorable commercial treaties.

—Timothy May

consequences. Entire regions were trapped out. Indeed, much of the settlement of Siberia consisted of trappers moving eastward as the fur-bearing animals declined. At the same time, it is not difficult to understand why the Russians believed that the fur supply was endless. Among the Yakuts, sable furs held such a low value that Russian agents traded copper kettles based on the number of pelts that could fit into it.

Some efforts were made to establish fur farms, consisting of minks, sables, and other animals. In addition, diseases such as smallpox decimated the indigenous populations of Siberia, much as they did Native Americans in the New World. Yet at the same time the fur trade protected the native populations from conversion, as the Russian government prohibited Russian missionaries from proselytizing in the region.

The tsars, however, did not have the spiritual or cultural welfare of their Siberian population in mind. Orthodox Christians were exempt from paying tribute, so ultimately the administration of Siberia was more concerned with revenue than souls. Nonetheless, the Russians saw religion as a civilizing influence that would help maintain an orderly collection of furs. As a result, to promote civilization and to maintain the revenue, the Russians encouraged the spread of Islam in western Siberia and Buddhism in eastern Siberia.

Western Economic Expansion in Central Eurasia

The economic expansion that occurred in central Eurasia between 1450 and 1770 was primarily accomplished by the Russians, although they and China's Qing dynasty (1644–1911) did sometimes act as counterbalances to each other's ambitions. The Spanish, Portuguese, and other western Europeans concentrated primarily on Asian and American market systems.

Russian expansion was markedly different than that of the western European powers during this period on at least two fronts. First, Russia's expansion was primarily land-based, an extension of its geographical borders into immediately adjacent territories, whereas western European expansion was primarily sea-based to regions geographically separated by vast oceans. Second and somewhat related, the first wave of Russian expansion into central Eurasia under Ivan IV "the Terrible" (1533–1584) was not based on the same scientific and technological innovations undergirding the western European surge.

Rather, it was facilitated by the same essential methods and forces inherited from centuries past. It was not until the second wave of Russian expansion into central Eurasia under Peter I “the Great” (1682–1725) that any depth of comparison can be made between Russian and western European imperialism. This was due to Peter’s attempts at Westernization of Russia during his reign. Even then, however, one must still bear in mind that the comparisons would be mainly military, with the Russian case still proving different in terms of economic systems as well as its continuing land-based versus sea-based venture. Russian economic expansion in central Eurasia involved both unofficial private and official political dimensions, which were interconnected and overlapping yet nonetheless distinct. Independent Russian entrepreneurs were involved in those regional cross-cultural contacts and trade networks from before the time of Ivan IV, possibly from as early as the Mongol era (1206–1368).

Under Ivan IV, Russian economic expansion in central Eurasia became clearly and decisively official via his annexation of Kazan, the capital of Tatarstan, in 1552. Through this move, the Russian state effectively took control of the trade flowing into and out of Kazan and began funneling its revenues into the Russian system. Land and property redistribution from Tatar Muslims to Russian Christians significantly affected the balance of economic advantage. The destruction of mosques and their conversion to Orthodox churches proved beneficial to construction crews and other Russian laborers, not to mention clergy, nuns, tax collectors, administrators, and others who gained employment through what in Tatar memory became “the darkest day” in their history. The annexation likewise opened greater spheres of opportunity for Russian merchants to be more directly involved in the trade with central Eurasia, gaining a state-supported upper hand in most economic affairs. This would have affected, in particular, the already existing trade among Bukhara, Khorezm, and Moscovy as well as Bashkorts, Kazakhs, western Siberians, and Moscovy, among others.

While no western European powers are known to have penetrated central Eurasia directly during this period, in 1553 an English expedition seeking a northern route to China was

sailing through the Barents Sea and happened upon the Russian White Sea port of Archangel. News reached Ivan, who welcomed them in Moscovy, as Russia was known before 1547, and granted them a monopoly on trade, free of customs. English goods thus entered the Russian market in sizable increase and steady flow. It would not be beyond reason to suppose that English goods began making their way into the central Eurasian markets through this historically unintended yet auspicious trade agreement.

Not long after, Russian control was extended to Astrakhan, a flourishing hub at the western edge of the central Eurasian trade network situated just above the Caspian Sea in the Volga River delta with links reaching all the way to Europe, Moscovy, southwestern Asia, Persia, and India. This effectively repeated the process that occurred in Kazan, though the takeover was not as dramatic or the destruction as great.

It remains a fact, however, that throughout Ivan IV’s reign all the way down to the early 1700s near the end of Peter the Great’s age of Russian enlightenment, Russian interest was not primarily focused on central Eurasia but instead had turned itself westward and eastward, respectively. Foreshadowing the later halt westward in the Crimean War (1853–1856), Russia was turned back in its westward advance under Ivan IV in the Livonian War (1558–1582). The Siberian peoples to the east, however, were not nearly so well equipped to withstand them, leaving Russia to extend its reach to the Pacific by 1689, spearheaded primarily by Russian fur trappers and other traders who blazed the trail that state officials and missionaries soon followed, supported of course by Russian military personnel.

It was the eastward advance across Siberia, together with the earlier conquests of Kazan and Astrakhan, that laid the groundwork for the next push deeper into central Eurasia, beyond Tatarstan and Bashkortistan into the Kazakh steppe and the oases areas farther south. That push can be dated to 1715–1762, from late in Peter’s reign to the ascension of Catherine II “the Great.” More accurately, the Russian intrusion into the central Eurasian steppe and oases regions has been depicted as occurring in three major stages dated 1715–1822, 1822–1867, and 1867–1895.

Peter I turned Russia's attentions back upon central Eurasia in 1715, calling it "the key" and the "gate" to the wealth of Persia and India. In that year, he sent a reconnaissance mission into the Caspian Sea that reached to Khiva (in modern Uzbekistan) with a view to strengthening Russian trade links with Persia and India by expanding Russian presence in central Eurasia. It was perhaps fortuitous that in the following year Zhungar forces attacked Russian troops near the converging borders of Mongolia, Kazakhstan, and Russia, with another clash occurring in 1720. Peter was mindful that menacing Zhungar (also called Oyrat or Kalmyk) raids from north-western Mongolia into Kazakh territory had been taking place with increasing severity since near the beginning of his reign. Thus, between 1716 and 1720 Russia established three military outposts—Omsk in 1716, Semipalitinsk in 1718, and Ust-Kamenogorsk in 1720—that effectively laid claim to land pressing into Kazakhstan's northernmost regions. The fortresses served to protect Russia from Zhungar attacks while at the same time intensifying Russian control over Russian-Kazakh economic exchange.

After Peter's death (1725), Russia secured agreements of allegiance and cooperation from each of the three Kazakh clan leaders in exchange for protection from the Zhungars, first from the Smaller Clan in 1731, then from the Middle Clan in 1740, and finally from the Large Clan in 1742. During the same period, Russia established more colonies along the Russian-Kazakh borderlands, namely Orsk in 1735, Orenburg in 1743, Iletskaia Zashchita in 1743, and Petropavlovsk in 1752. The Chinese defeat of the Zhungars in 1758 should have ended all pretense by Russia to advance farther into the Kazakh steppe, but it did not. By the time of Catherine the Great (1762–1796), the latecoming heir of Peter's vision, the central Eurasian steppe had been prepared for her "civilizing mission" among the Kazakhs. This included among other things the official enlistment of a multitude of Tatar Muslim merchants and missionaries to help extend Russian economic and political control over their Kazakh Muslim kin. However, it would not be until the middle of the nineteenth century that Russia would take full effective control of the southern central Eurasian regions.

The Worst of Enemies and the Best of Friends—Anglo-Portuguese Treaties, 1642–1703

The commercial relations between England and Portugal can be dated back to 1294. This long relationship was not always an amicable one, but it influenced and was influenced by political factors. While the relationship remained fairly equitable through the sixteenth century, foreign policy soon interfered and changed the balance in favor of England. By the middle of the eighteenth century, Portugal would be irrevocably dependent on England for trade.

Throughout the medieval period both countries shared commercial relations, with England exporting cloth to Portugal and Portugal sending such produce as fruit to England. Things remained friendly between the two until 1580 and the union of the Crowns of Spain and Portugal. The defeat of the Spanish Armada in England in 1588 caused English merchants to be expelled from Portugal until 1640, when the Portuguese were able to regain their independence. While England was one of the first countries to recognize Portuguese independence, things would change once again after the English Civil War and the emergence of Oliver Cromwell. In the 1640s and 1650s, treaties were signed between the two countries in which English merchants living in Portugal received significant

concessions such as easier access to the Portuguese colonies and freedom of worship, while in return the Portuguese only received recognition of their independence and the avoidance of an Anglo-Portuguese war.

Relations would improve after 1660, when Charles II came to the throne and the monarchy was restored in England. Charles married Catherine of Braganza, the daughter of João IV, which brought England £1 million and the colonies of Bombay and Tangier. While Tangier would not be very advantageous for England, Bombay would eventually afford the British the opportunity to colonize India gradually throughout the eighteenth century. In turn, Portugal received English ships and troops to assist them in their ongoing war with Spain. Although Portugal was required to pay for these services, the military aid did help ensure their independence once and for all.

The treaties of the seventeenth century served to create a tighter economic bond between the two countries, while the British slowly became the dominant party in this relationship. As the seventeenth century drew to a close, the scope of trade changed dramatically. As the popularity of Port wine grew, the Portuguese began concentrating on exporting that and other luxury items to England. Some even began pulling out their wheat fields in order to plant vineyards and partake in this new trade. While the Portuguese were exporting luxuries, they began importing necessities such as wheat and cloth from England. The Portuguese king, Pedro II, attempted a halt of this trade imbalance by imposing mercantilist policies in 1684 and 1685. Among these policies was the banning of English wool, which hurt the English because Portugal was their biggest customer. Things would change once again due to foreign policies and wars.

The War of the Spanish Succession (1701–1714) would seal the fate of the trade imbalance between England and Portugal with the Methuan Treaties of 1703. Of the three treaties negotiated by John Methuen, the first two were defensive and related to the War of Spanish Succession, while the third was commercial. The third treaty is by far the most infamous of the three, and it is one that many historians point

➤ JOHN MULES—AN ENGLISH MERCHANT IN PORTUGAL

The story of John Mules is an unusual one. Most English merchants who lived in Portuguese port cities lived in communities set apart from the Portuguese people. However, some did intermingle with the Portuguese population. Mules is an example of those who did manage to somewhat assimilate.

John Mules (sometimes spelled Miles or Muley) was perhaps the most prominent English merchant living in Portugal in 1650. However, unlike the other English merchants, he became almost fully integrated into Portuguese society. He first arrived in Lisbon as a young man in 1620. It is unknown if he was raised Catholic or converted in Portugal, but he married a Portuguese lady, and his many children were raised Catholic as well. Even though he eventually became naturalized as a Portuguese subject, he was never fully trusted by the Portuguese government. He was always referred to as English and treated as a part of the English community. Despite being treated as a foreigner, Mules was conferred special privileges by King João IV such as the right to send codfish from Newfoundland to Brazil without having to stop in Lisbon, which was normally the practice. After 1652 Mules's name disappears from the records, but it is unknown if that is because he retired or died.

—Monique Vallance

to as the moment in which Portugal became irrevocably economically dependent on England. By 1703, Portugal had entered into a Grand Alliance with England and the Holy Roman Empire against France and Spain in a battle for the rights to succession of the Spanish throne. Portugal was upset that France's wines were still being imported by England at a cheaper rate than the Portuguese wines, even though the two countries were enemies. King Pedro II was able to negotiate a preferential tariff for Portuguese wines, but in exchange he not only had to lift the ban on English wool but also had to allow it to enter the country duty-free.

Even though the treaty of 1703 is often pointed to as the defining moment in which Portugal became economically dependant on England, it was more the nail in the coffin of a

system that had been in place since 1654. The 1661 treaty established the Anglo-Portuguese trading relationship. The Portuguese appeared as though they were giving up too much in return for nothing, but actually what they were receiving were intangible things: security and freedom. Some modern historians suggest that the Portuguese were somehow tricked into giving the English so many advantages in trade. However, the Portuguese knew that it would be impossible to maintain their independence and empire without the help of the English. Selling off some of the empire was better than losing the entire kingdom.

Early Modern Silver Trade

Silver comprised 60 percent of the output of north and central European metal-mining companies in the period between 1450 and 1600 and flowed into western Europe from Germany, Hungary, and Tyrol. Starting in the second half of the sixteenth century, silver also flowed into Europe from the Spanish colonies of Mexico and Peru, a supply that continued throughout the seventeenth century and came to dominate the European market. The tremendous but imbalanced expansion of the production of silver vis-à-vis other precious metals like gold and copper generated opportunities for shrewd money dealers to profitably speculate on the difference between the official mint ratios and the market value of precious metals. Hence, the value ratios between the precious metals inevitably changed. In the fifteenth century the European commercial gold-to-silver ratio expanded from 1:9 to 1:10, by 1600 the ratio grew to 1:12, and by 1700 the ratio grew to 1:15. But since silver was valued far more highly than gold in the Middle East and the Far East, the Western merchant had everything to gain from paying for his Eastern purchases in silver.

Amsterdam emerged as the major center for the redistribution of commercial silver both to northern Europe and to the Far East. The Portuguese, speculating on the relatively high silver prices, first began exporting Spanish silver coins (*piastra fuerte*, or “rials of eight”) to the East Indies in the sixteenth century. While at first the Dutch also exported many *piastra fuerte* to the Levant and the Far East, from 1625 Holland’s own silver trade coins commenced in gaining ground. By 1640 the Dutch East India Company was exporting an average of 1 million guilders of silver per year to the Far East, giving Holland the majority position in Oriental silver exports at the midpoint of the seventeenth century. By 1660 this average had increased to approximately 1.5 million guilders per year. The Dutch were assisted in their enterprise by their connection to new mining expeditions in Japan and, to a lesser extent, in China, Tonkin, Sumatra, and India. The history of Japanese mining was defined by two factors: the abrupt opening of silver mines throughout the country in the middle of the sixteenth century and its massive increase in silver production from this time to the middle of the seventeenth century. At its zenith, Japan’s silver output rivaled the production figures of the New World.

In Asia, Japan had become a major silver supplier by the mid-fifteenth century. Around this time, the Chinese switched from a paper currency to silver coins. Although the silver-to-gold ratio was more favorable in China, the trade embargo between the two countries did not allow for trade, so they relied on smugglers and the Portuguese to facilitate the trade. The Portuguese remained at the forefront of the East Asian trade until the beginning of the seventeenth century. Straddling the Asian scene, the Dutch East India Company had by 1639 established a monopoly on trade with Japan. Between 1640 and 1667, the Dutch company exported an average of 1.3 million guilders of silver per year from Japan to southern Asia. Thus, the company’s engagement in inter-Asiatic trade provided it with a sizable proportion—between one-third and one-half—of control over the world’s extant silver. This situation prevailed until 1668, when the Japanese government issued a decree prohibiting the exporting of silver, thus eliminating a vital factor in the Dutch company’s success. As

a result, companies throughout Europe staked heavily in Bengal, prompting demand for silver to increase correspondingly. But the Dutch company grew increasingly dependent on supplies of silver coin and bullion from its native Holland. Its exports rose during the 1680s and 1690s from 2.4 million to 3.6 million guilders annually, and in 1700 the company achieved a momentary peak of 5.1 million guilders. Ascending in the initial decades of the eighteenth century, another peak transpired between 1722 and 1728 when the Dutch company exported 6.8 million to 7.9 million guilders annually to Asia, largely in the form of Dutch *ducats*. While its exports would gradually decline, at no time in the next 30 years was the Dutch company's business less than 3 million guilders annually.

Second in the silver market only to the Dutch company was the English East India Company, officially founded by royal charter in 1600. Exporting to the Levant, the Indies, and southern Asia, the English company found its supplies in Cadiz, Lisbon, and, interestingly, Amsterdam. Of the three, the Spanish port city of Cadiz proved the most important to the English company, making Spain its ultimate fountainhead of silver. The Spanish brought large quantities of silver from their settlement at Acapulco, which quantities furnished the English company with annual profits of £14,700. Its most popular export was the piastra fuerte, which in India circulated side by side with the local currency, the *mahmudies* and rupees, and in the Indonesian archipelago became the major currency. To assert its hegemony, England minted its own coin of the same silver content as the piastra fuerte for trading by the English company, with the emblem of the *porticullis* on one side and the Arms of England on the other.

THE IMPORTANCE OF SILVER IN THE EARLY MODERN GLOBAL ECONOMY

The importance of the early modern silver trade was noted by scientists and economists of the time. Thus, Sir Isaac Newton observed before the British Parliament in 1717 that “When ships are lading for the East Indies, the demand of silver for exportation raises the price from 5 [shillings] 6 [pence] or 5 [shillings] 8 [pence] per ounce or above.” Likewise, in his 1776 *The Wealth of Nations*, Adam Smith explained why it was advantageous to carry silver rather than gold to Asia and Manila:

“because in China, and the greater part of the markets of India, the proportion between fine silver and fine gold is but as ten, or at most as twelve to one; whereas in Europe it is as fourteen or fifteen to one. . . . In the cargoes, therefore, of the greater part of European ships which sail to India, silver has generally been one of the most valuable articles. It is the most valuable article in the Acapulco ships which sail to Manila. The silver of the new continent seems in this manner to be one of the principal commodities by which the commerce between the two extremities of the old one is carried on, and it is by means of it, in a great measure, that those distant parts of the world are connected with each other.”

Couriers du Bois—The Canadian Fur Trade

As a result of contact between American Indians and Europeans in the North American wilderness, the fur trade dominated Canada's economic activity from the seventeenth century

➤ MÉTIS

The growth of the Canadian fur trade depended on intermarriage between Native American women and European men. Until the nineteenth century, European women were practically prohibited from the Canadian West. As a result, intimate relations between Indian women and European men were common. Marriage, though, rather than promiscuous relations was the norm. A native wife served as a critical liaison between Indian and European groups. The children of these interracial relationships were known as *métis*, people of mixed native and European ancestry. *Métis*, while found throughout Canada, were particularly common in fur trading areas. Two different groups of *métis* developed. One group descended from Hudson's Bay Company traders and the mainly Cree women who lived near their trading posts. The other group was a mixture of French traders and native peo-

ples. British *métis* were Protestant, spoke English, and often identified with their European ancestry. French *métis*, however, were generally Catholic, spoke French, and viewed themselves as a distinct Indian nation. In time, many Hudson's Bay Company fur traders came to prefer mixed-blood rather than Indian wives. Additionally, company officers intentionally raised their daughters in European rather than Indian cultural practices, another early indication of a growing racial divide. European women became increasingly present in the Canadian West beginning in the 1830s. After the Hudson's Bay Company sold its land to Canada in 1869, a period of frontier settlement began in the former fur territory. Intermarriage between white men and native women grew rare even as the sexual exploitation of native women increased.

—Kassi Klinefelter

to the nineteenth century. The French intermediaries engaged in this commerce came to be called *coureurs du bois*, or runners of the woods, a version of the original Europeans who traded for furs with American Indians. During this period the fur trade moved from east to west and from individuals to competing companies and finally to a monopoly by the Hudson's Bay Company.

Animal furs were Canada's first widely exploited resource. The continent's ten million beavers, 30–60 pound (13–27 kilogram) animals that live near water year-round, attracted the most attention from fur traders. Their fur produced felt for hats, which was a European fashion trend in the seventeenth century. The number of beaver furs sold reached a high point in 1793, with 182,346 furs purchased from Canada. Not surprisingly, beaver populations were decimated. As areas were exhausted, traders and Indians moved westward along Canada's waterways in search of additional animals. Fur traders caught and sold other animal hides as well. For instance, bears, deer, and raccoons were popular at the turn of the nineteenth century.

The French explorer Jacques Cartier discovered Canada's mainland in 1535 while searching

for a new route to Asia. He led three ships 800 miles (1,300 kilometers) up the St. Lawrence River, past present-day Quebec. His discovery gave France claim to the Canadian inland. However, by 1615 only 50 Frenchmen lived in the St. Lawrence colony. Initially, only fishermen and independent traders traveled to Canada from France. Étienne Brûlé, who lived with the Huron aborigines, is one example. It is believed that in 1612 he was the first Westerner to see Lake Superior and Lake Erie. In 1627 the *Compagnie des Cent-Associés* formed the first significant settlement in the area and controlled the St. Lawrence colony until 1663, when the French government assumed control and created New France.

In the mid-1600s British traders became active in the Canadian fur trade. Their most significant effort was the Hudson's Bay Company, chartered in 1670. This company gave its London investors control of the Hudson Bay drainage basin, approximately 40 percent of present-day Canada. Until the British conquered Canada in 1759, the Hudson's Bay Company and French traders competed fiercely for furs. The English traders relied on American Indians to deliver furs to their posts, whereas the French

traders brought their goods inland. English traders also differed from their French counterparts by avoiding involvement in Indian wars and efforts to Christianize or settle the Indians.

Life on Hudson Bay was uncomfortable. The summers were hot and plagued by insects, while the winters were bitterly cold. The company devised strict rules to govern the lives of its North American traders. Hudson's Bay Company traders were expected to lead virtuous, celibate lives; perform religious habits; and avoid alcohol and gambling. The company also tried to prohibit intimate relationships between its traders and Indian women. For the most part, however, it appears that traders regularly ignored the company's rules. Marriage between the two groups in particular became common, creating a significant métis population.

Even after the defeat of France in the Seven Years' War (1754–1763), the Hudson's Bay Company faced competition, especially from the North West Company, a coalition of Highland Scot traders. This Canadian-based company overshadowed the Hudson's Bay Company by venturing inland like their French predecessors. This situation changed in 1811 when Hudson's Bay Company stockholder Lord Selkirk established a settlement on the Red River, where the North West Company collected provisions for its transcontinental journey. During the last five years of the decade, this settlement created intense competition between the two companies until they merged into one company. The new Hudson's Bay Company was approved by the British colonial office and given administrative control of all nonsettled portions of British North America.

The Canadian fur trade declined over the nineteenth century. One aspect affecting the trade was the international price of beaver fur, which plummeted from 1837 from 1854, falling from 30–32 shillings to 7–8 shillings per pelt. Another factor was the Hudson's Bay Company's monopoly, which forced eastern Canadians to rely increasingly on timber. Finally, the 1797

*Rival companies soliciting trade with Native Americans in Canada, about 1680, illustrated in Charles Carleton Coffin's *Old Times in the Colonies*, 1898. (Library of Congress)*

invention of the steel trap and improved bait exhausted Canada's beaver fields. As a result, the Hudson's Bay Company's charter was extended for the last time in 1838; the British Crown granted the company a 21-year extension in an attempt to protect its American Indian subjects by preventing farming settlements in the area. The company officially closed in 1869 when it sold its remaining land to Canada. While its heyday had passed, fur trading continued into the twentieth century.

■ Introduction: Trade Goods for a World Market

Prior to 1500, the largest share of trade was local and involved food crops, raw material, and local hand manufactures. Long-distance trade did flourish and trade routes crisscrossed Asia, Africa, and Europe, but there was still no unified system of trade, and goods traveled in stages from one set of traders to another before reaching their final destination. The three great trade routes, via the Red Sea, the Persian Gulf, and the Silk Roads, were well outside the control of the great Italian merchant states, and the Muslim traders dominated the trade with China. Between 1450 and 1750, however, a new economic reality gradually emerged. By the early seventeenth century, European mariners had decoded the prevailing wind patterns across the vast expanses of the world's oceans, and goods of all kinds and people of all nations ranged over most of the globe. In this new global trade, Europe integrated America and Asia into larger trade network, intensifying interregional trade and promoting the spread of new crops and goods.

The Indian Ocean littoral remained one of the most vibrant and diverse economic centers of the world. From southern and eastern Asia came silk, ceramics, sandalwood, black pepper, and other spices. Western Asia supplied horses, textiles, metal goods, frankincense, and products from the Mediterranean. East Africa's trade with the Islamic world was not restricted to Egypt and the Red Sea but instead involved much of the eastern Indian Ocean littoral. One of the principal trading commodities was gold, which came from the region of Zimbabwe in southern Africa. Slaves were another highly valued commodity, as were elephant ivory and spices such as cloves. Imports to East Africa included ceramics and textiles from Iraq, Iran, India, and China. In West Africa gold was also the principal commodity, mined in the Bambuk, Bure, and Akan areas of the rain forest. Another major commodity was salt from the central Sahara, which enabled the Tuareg to exchange salt for gold, which was then transported by caravans to North Africa. Among other trade goods

were hippopotamus teeth that were used as ivory in parts of Europe and North Africa.

The arrival of Europeans to the coast of western Africa marked the start of the transatlantic triangular trade. Sailing from bustling ports such as Amsterdam, London, Lisbon, and Nantes, European traders carried guns, textiles, and other manufactured goods to Africa. There at coastal trading posts they traded their goods for slaves, who were then transported across the Atlantic to slave centers in the Americas, where they were sold or exchanged for colonial goods (sugar, coffee, tobacco, etc.). Returning to Europe, the traders sold these colonial goods at a great profit, part of which they then reinvested into new trading trips to Africa. Slaves played a central role in the shift of the global economy from the Indian Ocean to the Atlantic and in the rise of Europe as a dominant economic power. African slaves worked on plantations that produced cash crops and mined much of the silver that fueled the European economy. The Atlantic commerce helped jump-start the European Industrial Revolution and sustained military expansion that allowed Europe to carry goods across the globe.

Within a few decades of Columbus's voyages to the Americas, the exchange of crop species such as corn, wheat, coffee, tea, and sugar between continents had revolutionized the world's agricultural and labor markets. Thus, once a year the Spanish Manila galleons left Mexico weighed down with silver to venture westward along the equatorial route, pioneered by Magellan, to Manila in the Philippines. The silver was exchanged for oriental luxury goods, mainly high-quality Chinese silk, that had been brought in junks from the southern coast of the Ming empire to the Philippines and then shipped on the Manila galleons east to Acapulco. The sublime Asian luxuries, particularly silk, were the rage in the Americas, and upon visiting Mexico City in 1677, the Irish friar Thomas Gage was stunned to see "both men and women excessive in their apparel, using more silks than stuffs and cloths. . . . [In the jewelry district,] a man's

eyes may behold in less than an hour many millions worth of gold, silver, pearls, and jewels.” Drawn by the enormous profits of the silk trade, Spanish colonial merchants and bureaucrats routinely ignored royal edicts prohibiting any trade that circumvented Spain. Instead, Spanish colonial merchants established trade diasporas in the Philippines and Mexico and vigorously competed against each other.

In North America as in northern Eurasia, the fur trade remained for a long time the most profitable of commercial enterprises. At first Native Americans traded furs for European clothing, metal tools, and firearms, allowing Europeans to buy furs relatively cheaply and sell them dearly. European markets showed great demand for marten, muskrat, mink, otter, beaver, wolf, bear, and lynx, prompting enterprising French and British traders to establish companies to acquire and sell furs. Thus, the French traders routinely left their base at Montreal to roam the vast expanses of the Canadian prairies. In the early eighteenth century the French used the fur trade to further their strategic interests by building a series of fortified trading posts from New Orleans to Montreal that barred the western expansion of the British colonies. At the same time Russian merchants dominated the fur trade in northern Eurasia, where they served as middlemen between fur-producing northern Siberian regions and the main markets in Europe and the Middle East. The Stroganov family played a major role in supplying these precious commodities to the markets. The Stroganovs established trading posts across the Ural Mountains, regularly dispatched agents to purchase furs with European wares, and then sold furs to English and Dutch merchants. When increasing friction with the native peoples threatened this profitable trade, the Russian authorities encouraged the conquest of Siberia by private entrepreneurs and small armed bands, who forced the natives to pay tribute in furs (the so-called *yasak* system).

Europe was crisscrossed by numerous trade routes that carried goods to every corner of the continent. Luxuries (silks, spices, and gems), essentials (cotton, alum, and dyestuffs), and manufactured goods (cotton cloth, glassware, and metal goods) flowed from Italy and the Levantine

ports to western and northern Europe. The northern trade routes, dominated by the Hanseatic merchants, brought bulk items (grain, timber, iron, furs, etc.) from Scandinavia, Poland, and Russia to the rest of Europe. New textiles came from the Netherlands and England, while the annual arrival of spice ships from South and Southeast Asia marked the economic calendar for all of Europe.

—*Alexander Mikaberidze*

Mughal Decorative Arts for Western Styles

In the sixteenth century, European merchants in India were amazed by the types of precious items available in addition to the spices. Among these precious items were types of cloths not normally used in Europe as well as furniture produced by Indian craftsmen intended for the mundane comfort of Western traders. Indian craftsmen started to produce recognizably European furniture in Indian hardwoods after observing the astonishing habits of early European travelers who visited Indian bazaars; although Indians customarily sat and slept on the ground, these “stiff-jointed” Europeans chose to sit on chairs and lie in beds. These products fueled an export market in more luxurious pieces including cabinets and traveling chests on stands, fitted out with compartments and drawers, that were adorned by expensive Mughal decorative arts. The finest pieces had intricate inlays of ivory, mother-of-pearl, and ebony *sadeli* (artwork used to decorate wooden objects). Some incorporated both Mughal figures and Christian subjects, including the Madonna and Child or the Crucifixion.

Soon enough, Europeans cast envious eyes on another Mughal craft, the sumptuous knotted carpets produced in factories that Emperor Akbar established in Lahore and Agra. Traders and ambassadors entering the great Mughal court were obliged to remove their shoes and walk barefoot on magnificent carpets. By 1615 the East India Company started importing huge Lahori carpets into England where, curiously, they were put to use as table covers for major official ceremonies. The earliest imports were elaborate

► OF THE TRADE IN ELEPHANT TEETH, VELVETS, AND CHICKINOS

European traders sought many precious items from India. One European merchant, Cesare Federici, from Venice, wrote in amazement about the items available for trade while he explored along the Indian coast of the Arabian Sea in the sixteenth century:

“I could not have beleaved that there should be such a trade as there is: for in the time of every new Moone and every full Moone, innumerable small barks come in and out, laden with all sorts of spices, with silke of China, sandals, carved Elephant teeth, Velvets, Chickinos which be pieces of golde worth seven shillings apiece sterling, and with divers sorts of other marchandize. Also these barks lade out, as it were, an infinite quantity of Cotton and cloth of all sorts, as white stamped and painted, with great quantity of Indico . . . turbants made in Diu, great stones like to Carne-laens, Granats (garnets), Agates, Diaspry, Calcidonij, Hematites, and some kinde of diamonds. . . .

“I saw very maruellous things: there were an infinite number of artificers that made bracelets called Mannij, or bracelets of elephants teeth, of diuers colours, for the women of the Gentiles, which haue their armes full decked with them. And in this occupation there are spent euery yeere many thousands of crownes: the reason whereof is this, that when there dieth any whatsoever of their kindred, then in signe and token of mourning and sorrow, they breake all their bracelets from their armes, and presently they go and buy new againe, because that they had rather be without their meat then without their bracelets.”

—Hugh Purcell

works of imagination, depicting elephants and mahouts (elephant drivers), dragons, crocodiles, fighting camels, cheetahs, and fantastic four-legged winged creatures in enchanted forests.

Cloth has always been the most global of all traded commodities, and long before European traders arrived in the region, India had been the established center of textiles. In the eighteenth century, the English initially sought out bright striped cotton weaves and muslins to use as cheap barter in their trade in the Spice Islands of Indonesia or for reexport to the Middle East and North Africa. It was the East India Company's resident agent in Gujarat, William Finch, who wrote to London proposing to launch “chinte” on the English market. Chintz is sometimes described as painted cotton; however, most of the color is applied not by brush but by using a blunt-ended bamboo stick or pen to draw the outlines. These mordant areas are then filled in by immersion in a vat of color. In conservative England, where linen and wool had been the principal materials for both furnishings and dress, decoration was simple, and the dyes were rarely colorfast. With

the importing of cotton and chintz, lightweight, bright, colorfast, and easy to wash new forms of cloth entered the market. But these new cloths had a mixed reception. The company directors demanded adaptations for the home market, preferring white backgrounds over the red. The red fabric was snapped up by the Dutch, who embraced the glowing red fabric.

Back in England, polite society, happy at last to have white-ground chintz on their walls and beds, remained resistant to wearing it. The earliest designs destined for the West emulated Jacobean crewelwork, depicting fantastic plants and trees emerging from rocky hills. These did not sit well on the human form, and the East India Company addressed the problem by commissioning the Indian chintz artists to replicate patterns of a daintier nature, often based on later Mughal taste for flowers as well as the developing European taste for chinoiserie (decorative arts influenced by Chinese styles). In 1660 Josiah Child mounted a marketing campaign circulating samples among influential style setters, including Charles II.

The status of chintz in the wardrobes of the fashionable upper classes was sealed in 1688 with the accession of Mary, daughter of James II, and her Dutch husband William to the English throne. By then, textiles accounted for 75 percent of all Indian exports into England.

The Chinese Porcelain Trade— "To Please the Eyes of the Europeans"

When the Portuguese established trade contacts with China in 1517, they encountered a well-established system geared to the production of export goods. As early as the mid-twelfth century, at least 20 percent of the income of the Southern Song dynasty (1127–1279) had been the result of maritime commerce. In fact, the blue willow pattern thought typical of Chinese designs had been developed for the South Asian market. The Chinese themselves preferred pure white. By the sixteenth century, porcelain production in Jingdezhen was the largest industrial operation in the world, with over 1,000 kilns, 70,000 workers, and a production process that employed nascent assembly-line processes.

Chinese success in porcelain making inspired European imitators. As early as 1575 the Medicis—unwilling to lose a potential source of profit—had been trying to create imitations of Chinese porcelain adapted to the taste of Europeans. By 1638 the Dutch East India Company was commissioning the manufacture of items of European design decorated in a variety of acceptable motifs inspired by Chinese porcelain. A

few years later the English East India Company developed reliable Indian sources for such items. During the turmoil of the late Ming and early Qing dynasties, Chinese producers were unable to fill European orders, losing the market to Japan by the 1660s. As soon as the Qing dynasty reestablished a measure of stability, Chinese artisans scrambled to recover their European customers, deliberately incorporating the most successful elements of Japanese products. Melding stylistic features resulted in many interesting hybrids, such as a graceful set of European-style goblets decorated in a Chinese adaptation of a Japanese chrysanthemum design.

Seventeenth-century European consumers did not attempt to distinguish between the goods of Japan, Siam, China, or India. They were searching for aesthetic representations that were in accord with their perceptions of the exotic East. Within a rather brief time, European-manufactured Chinoiserie appeared more Asian to British eyes than the Chinese imports. British aesthetic sensibilities had combined with a flawed perception of China to create a demand that could not be satisfied by traditional Chinese motifs. Unwilling to relinquish a profitable market for their wares, the Chinese made stylistic adaptations to satisfy British tastes. By the end of the century, Chinese artisans were producing Baroque artwork for European consumption, thinking that they were replicating European designs. "Chinese" patterns had become so completely adapted to European standards that most Chinese artisans were unable to recognize any trace of Chinese influence in them. The resulting interpretations by Chinese craftsmen of Baroque and European pseudo-Asian exotica produced some attractive pieces, such as goblets described above, but there were also rather bizarre combinations, such as a Chinese-style lemon basket decorated with plump nude Renaissance-style cherubs.

The early modern European fascination with Eastern trappings reached Portugal first. When Vasco da Gama sailed to India in 1497, King Manuel ordered him to bring back "*porcelanas*," among other things. Da Gama did bring porcelain with him, and this began the Portuguese domination of the porcelain trade for the next century. In the 1530s alone, approximately 40,000 to 60,000 pieces of porcelain arrived in

Lisbon every year. From there it spread across the royal houses of Europe. Philip II collected some 2,000 pieces of Chinese art, primarily porcelains. It was probably in the court of Louis XIV, however, that the interest first became a mania. In his search for rare and elegant ornamentation for Versailles, Louis XIV developed a taste for Chinese art, going so far as to appear at a ball “dressed half in the Parisian fashion, half in the Chinese.” His flamboyant brother took things a step further and occasionally garbed himself in his own interpretation of the style appropriate for a great Chinese lord. The interest soon spread to the court of their less affluent relatives in England. The Stuart court introduced the vogue, but it did not come into flower until the arrival of William and Mary. Mary’s fondness for Chinese porcelains proved highly contagious. Continental fashions influenced England’s taste, but English Chinoiserie soon developed its own distinct quality.

Some collectors, British as well as continental, obtained authentic Chinese art, but those pieces should not be confused with Chinoiserie. The growing popularity of Chinoiserie is somewhat misleading. While the trend does signal an interest in the East, as discussed above, Chinoiserie itself is a distinctive European art form, an interpretation of Asian exotica. European interest in Asia was in large measure dependent upon finding an “Asia” that satisfied European expectations, with both European and Asian craftsmen producing items in accordance with European designs. Asia could be whatever Europeans wished: a metaphor for the tranquility shown on the blue willow porcelains, the Baroque opulence of a mandarin court, the ferocity of a dragon, or the serenity of a Confucian scholar. The China of European literary figures was as malleable as that of artists and merchants.

Pepper Country—Sixteenth-Century Malabar, India, in the Global Marketplace

It was no coincidence that the Portuguese explorer Vasco da Gama, at the end of his epic voyage to the East, dropped anchor at Calicut (Kozhikode) on the Malabar Coast of southwestern India in 1498. Here was the gateway to the world’s greatest pepper-growing region. Malabar not only had the perfect monsoon climate to produce quality black pepper, cardamom, cinnamon, ginger, and turmeric, but it was at the heart of the oriental spice trade, an ancient network of seaways where ships from China and the Spice Islands of the East Indies bearing cloves, nutmeg, and mace converged with Arab dhows from the Middle East.

Before da Gama’s intervention, Arabs dominated the spice trade into Europe for centuries, transporting cargoes by sea and then in overland caravans to the Mediterranean. This brought wealth to the Mediterranean city ports of Alexandria, Genoa, and Venice. This Arab “monopoly” relied on creating great demand and maintaining utmost secrecy about their sources of supply. As prices escalated, discontent spread through the capitals of Europe. Spies were dispatched to identify the destinations of vessels trading out of the Red Sea and the Persian Gulf.

Throughout the fifteenth century, Western seafarers, especially the Portuguese who had quietly been making technological improvements in ships and cartography, sought a sea route to the legendary spice-bearing lands in the East. When da Gama rounded the Cape of Good Hope and traveled up the east African coastline and across the Indian Ocean to Malabar, he helped to define a moment in the Age of Exploration.

At Calicut, da Gama sent word to the local ruler, the Saamoothirippādu, or Zamorin, that he carried a letter from King Manuel of Portugal. Flattered, the Zamorin had da Gama processed through the city in a palanquin to the

palace, where a Brahmin priest took da Gama by the hand through heavily guarded antechambers into a vast audience hall ringed with tiers of seats occupied by courtiers. The Zamorin himself was seated on an *alkatyf*, or carpet, wearing fine white calico brocaded with gold flowers and large diamonds and a jewel-encrusted cap. Over *arrack* and *betel*, a treaty was enacted.

Muslim brokers in Calicut made every effort to overturn the Zamorin's deal with his exotic visitor. After all, through him they enjoyed unqualified access to the very best pepper, buying it at a fraction of the cost at which they sold it on to the Middle East. They were not prepared to share this profitable trade. They worked on the Zamorin, ridiculing the poor quality of da Gama's gifts, and in truth, European cloth, coral beads, and honey were inadequate presents for a king whose annual revenues were huge. Worse, da Gama had lied about having many ships under his command, explaining that he arrived with only three ships due to a storm scattering his fleet.

Relations deteriorated, and da Gama's sailors were reduced to bartering for sustenance on the waterfront. Da Gama was imprisoned, although the Zamorin eventually freed him and allowed him to acquire some spices and gems. However, da Gama's return voyage proved traumatic. He fought off an attack by boats out of Karnataka, and he then faced the monsoon storms as he crossed the Indian Ocean on his return to Africa, while 30 crew members died of scurvy. However, in 1499, more than two years after his departure, da Gama returned to a hero's welcome in Lisbon.

Da Gama's pioneering voyage of discovery proved the catalyst for a series of events that changed the world, triggering a lengthy Portuguese monopoly of pepper. In 1502 da Gama led a punitive expedition of 14 heavily armed ships back to Malabar. He relentlessly pursued his enemies, committing shocking atrocities against the Zamorin's people. Ironically, da Gama's one last mission in 1524 was to improve trade relations, but his savage reputation was remembered. He eventually died in Cochin.

One hundred years later, the formation of two powerful European rivals would come to dominate trade between Asia and Europe: the English East India Company, chartered in 1600,

➤ PEPPER (*PIPER NIGRUM*)

Black pepper has been one of the most valued spices throughout human history: fresh food, especially meat and fish protein, quickly becomes rancid, so pepper was prized as a preservative, and its hotness disguised any flavor of decay. Native to Malabar in southwestern India, pepper grew wild in the hills. Traditional medicine practitioners used it to treat indigestion and intestinal gas. It features in the sixth-century BCE Ayurvedic textbook the *Susrutha Samhita*. The epic *Mahabharata* describes feasts with meat sprinkled with pepper.

In Europe, pepper had been highly prized even in antiquity, and by the Middle Ages it was in such demand that peppercorns became a form of money, accepted in dowries, taxes, and rents. In London, a Pepperers' Guild of merchants was formed in 1180. In 1603 the English East India Company landed its first cargoes of peppercorns and other spices in London, but these were from Sumatra and Java (now in Indonesia), where pepper had been planted by early Hindu colonists. Although pepper was the company's single most important commodity, only in 1685, when the company was forced out of its major pepper factory on Java, did it turn to Malabar as an alternative source.

—Hugh Purcell

and the Dutch United East India Company, chartered in 1602. The two countries took advantage of Portugal's short union with Spain in 1580 and subsequent decline. Indeed, Elizabethan England awoke to the riches to be had in the East when privateers captured a Portuguese carrack, the *Madre de Deus*, laden with spices, jewels, porcelain, and textiles. A document on board comprehensively describing Portuguese trade in the East proved key to persuading Queen Elizabeth I to grant the royal charter to trade there.

In the end, it was the Dutch who seized the initiative in Malabar. In 1604 they signed a treaty with the Zamorin and began ousting the Portuguese from all their strongholds to the south until 1663, when they wrested control of Cochin. Despite growing competition from the British and French, the Dutch effectively controlled the Malabar economy for 130 years.

Ruling the Tea Lanes—Shipping Tea to America

The ancient commodity of tea, the product of leaves from a rather common plant found throughout Asia, found its way into Europe in the seventeenth century by way of the Portuguese, who were the first to introduce it in Europe in the sixteenth century. However, the Dutch were the first ones to gain a direct trading relationship with the Chinese and in 1610 brought back the first shipload of tea to Holland. Even after Britain came to dominate the trade of tea by the end of the eighteenth century, the strong economic and commercial power of the Dutch remained an important factor impacting the supply of tea throughout what would become the emerging global British Empire.

Competition among all European states intensified throughout this era with the establishment of colonial empires, and the desire for exotic goods from Eastern markets drove much of Europe's economic, political, and military policy. Since the late Middle Ages, England and the provinces of the Low Countries (the Netherlands) struggled for position among the other major powers of Europe, especially Portugal, Spain, and France. A trade rivalry then developed between the Netherlands and England that culminated in a series of conflicts known as the Anglo-Dutch Wars, spanning the years 1651–1784. In an attempt to stabilize their trade interests in a rapidly changing economic environment, England enacted a series of Navigation Acts to restrict trade activity with new colonies to English goods and English ships. The periodic

Anglo-Dutch Wars and the continued strain in trade relations between the two states therefore impacted the transport of tea.

The story of tea and its place in the early commercial history of the Americas has its origins before it even arrived in England. In 1600 Queen Elizabeth I chartered the East India Company and granted a royal monopoly on all trade of all products obtained in Eastern markets. Tea was not immediately a popular product in England, as it was sparsely sold until 1661, when the Portuguese princess Catherine of Braganza introduced it to the royal court. At that time coffeehouses were popular in London, and even as tea gained in popularity it remained mostly a drink of the aristocracy until the mid-eighteenth century. The British East India Company became a conglomeration of wealthy merchants that by 1750 was almost exclusively concerned with a monopoly on tea. At this point in time, the commercial rivalry between the English and the Dutch was erupting into war, and the English were intent upon preserving a balance of trade. Tea was also becoming a popular import in the American colonies, but the government monopoly of the East India Company was largely ineffective there because of the lucrative black market.

By the early eighteenth century, the Dutch supplied significant amounts of tea in colonial ports at a much lower cost than the East India Company. Although the Navigation Acts specifically prohibited this type of trade, the laws were widely evaded. The First Anglo-Dutch War of 1652–1654 during the Cromwell Protectorate resulted in no real conclusion to the naval and commercial rivalry, and further conflicts between the two nations continued. At issue was the dominance of the sea-lanes, trade hegemony, and the economic balance of power, but with the Restoration of the English monarchy in 1660, future Anglo-Dutch conflicts would also bear the new strain of dynastic and religious concerns as well. All of these factors served to intensify the commercial rivalry and encouraged continued Dutch activity with the American colonies in the mid-seventeenth century. However, the Glorious Revolution of 1688 temporarily lessened the rivalry, with the accession of William III, Prince of Orange, to the English throne with his wife Mary II. The ascension resulted in

some commercial cooperation until the death of William in 1702.

The centers of the tea trade in the Americas were major ports such as Boston and New York, which also became the political centers of rebellion against the British Crown by the 1760s. Because the British colonies of the New World had been chartered and were permitted to grow and administer themselves independent of strict commercial regulation, the increasing need of Britain to organize and centralize governing responsibilities caused conflict by the middle of the eighteenth century. Following the conclusion of the Seven Years' War, Great Britain achieved a state of peace from warfare for the first time in many decades. The role that the colonies played in the start of the French and Indian War contributed to the growing indebtedness of the British government and led it to seek new means of ordering its colonial holdings and raising needed revenues. Because of the popularity of and large demand for tea in the colonies, Great Britain sought to more firmly regulate the taxation of the commodity as a means of stabilizing its postwar economy. Rather than trade with the East India Company, and in opposition to the provisions of the earlier Navigation Acts, colonies in North America continued to trade in contraband and smuggled tea.

By 1763 the East India Company faced the threat of bankruptcy, the result of not only tea smuggling but also generally poor economic conditions of world markets at the time. The directors and merchants of the East India Company recognized that its diminishing profits could be bolstered by the extension of the tea monopoly to the British colonies of North America and pressured Parliament to take action. The political result was a series of acts of Parliament known collectively as the Townshend Duties. The name is derived from Charles Townshend, Britain's chancellor of the exchequer, who was responsible for maintaining and monitoring revenue flow. Among these acts was the Indemnity Act of 1767 that repealed all taxes on tea imported to Britain, which in turn made it less costly to ship to the Americas. To offset the potential loss of government revenue, the same Parliament passed the Revenue Act, which created new taxes on tea to be imposed in the colonies.

➤ ENGLISH COFFEEHOUSES

The commercial sale of tea as a leisure beverage accelerated in England during the seventeenth century as it began to supplant the popularity of coffee in the coffeehouses of the era. Coffeehouses had a generally negative reputation in the post-Restoration period of English history, and there is evidence of Charles II's attempts to suppress them. People of all social strata frequented such places, where conversations doubtlessly ranged from the mundane to the political. Coffeehouses tended to be places where people conducted business and made social connections, but in an age still concerned with proper class delineation in society, there was an element of suspicion associated with such an open atmosphere. Not only was coffee a popular beverage in such institutions, as the very name suggests, but tea also became popular, and demand for it increased because of this unique social outlet for its consumption. In England these were male-only establishments that provided the framework and model for the salons and clubs of the eighteenth century. The introduction of tea to the coffeehouse environment is most pronounced in England, and this environment did much to anchor tea's place as the preferred social beverage of the people.

—Cheryl H. White

Also within these Townshend Duties were new broad powers for customs officials to search and seize contraband tea.

Organized boycotts throughout the colonies expressed the generalized discontent over these measures, and tea consumption markedly reduced in response. The Regulating Act permitted the East India Company to ship tea to the American colonies without duty of any kind, which reduced the price of British tea far below that of illicit competitors. The result was that many Boston area merchants saw no valid fiscal reason to refuse the shipments of the East India Company any longer, but emerging discontent among groups such as the Sons of Liberty eventually forced the issue. Proponents of ongoing tea boycotts continued to organize anti-East India Company events, the most famous of which became known as the Boston Tea Party in

1773. In one of the most famous acts of civil disobedience, the Sons of Liberty emptied chests of East India Company tea into Boston harbor, one of many reactions in the colonies that foreshadowed the coming Revolutionary War.

War and Diplomacy

Throughout the fifteenth to eighteenth centuries, the majority of states around the world were monarchies. Government affairs and diplomacy were thus conducted almost entirely at the ruler's discretion and in accordance with her or his personal interest or worldview rather than from national considerations. Territorial expansion was one of the most common motives for war but was oftentimes tied to another key factor, preserving and expanding dynasty. This could be accomplished by conquest but also through subtle diplomacy in which marriage featured prominently. Thus, the Austrian Habsburg dynasty's skillful use of arranged marriages to further its dynastic interests proved to be so successful that it was eventually summed up in an elegiac couplet: "Let others wage war, but thou, O happy Austria, marry; for those kingdoms which Mars gives to others, Venus gives to thee." Rulers oftentimes looked upon their daughters as pawns in their diplomatic games. King Henry VIII negotiated several potential marriages for his daughter Mary. When she was only two years old she was promised to the son of King Francis I of France, but after relations between the kings soured, the contract was repudiated, and instead she was betrothed to her first cousin, Holy Roman Emperor Charles V. But once the arrangement failed, Henry considered marrying Mary to either King Francis I or his second son, but these endeavors led nowhere as well. After her father's death, Mary, now aged 37, began looking for a husband herself and married Prince Philip II, the future king of Spain. The marriage, however, proved quite unpopular in England, where many feared that it would lead to their country's dependency and subservience to Spain. It also caused hostility in France, which was at war with Spain and was alarmed at the prospect of being completely encircled by the Habsburgs.

During the Middle Ages envoys were usually dispatched to resolve some particular matter (negotiate a trade treaty, establish an alliance, betroth a princess, etc.), and once the mission was accomplished they returned home. There was hardly any diplomatic continuity. However, by the late fifteenth century international affairs and diplomacy became a rather complex undertaking that required a more permanent system of intrastate communications and remains so. The origins of modern diplomatic traditions can be traced to Italy, where national security came to depend on the speed and accuracy of information that each city-state had about its neighbor. These cities began a practice of establishing permanent embassies, and Milan, Florence, and Venice emerged as major centers of diplomacy, introducing many traditions of modern diplomacy that later spread to other European states and other parts of the world. The period saw further elaboration of the rules of diplomacy. Ranking of

diplomatic agents was introduced, and the fifteenth-century diplomacy saw the transition from medieval figures of diplomatic representation (nuncii, procuratores, legati) to those of the ambassador and envoy.

By the late sixteenth century, permanent missions representing one country in another became customary. But maintaining an embassy and its staff was an expensive undertaking, and minor states usually exchanged envoys and minister plenipotentiaries who were ranked below ambassador. The Renaissance era witnessed the introduction of sophisticated ceremonial and ritualized protocol for receiving diplomats and conducting negotiations as well as sending regular written instructions to ambassadors. Routine communications were conducted as a rule in the vernacular language (often using numerical ciphers), while treaties or other important documents were written in Latin. The

Ambassadors' lengthy dispatches usually contained important political, military, and economic information; pen portraits of prominent people; and rumors and whispers overheard at the court.

states established archives as depositories of documents so as to ensure diplomatic continuity and maintain histories of political, commercial, or other negotiations. Ambassadors' lengthy dispatches usually contained important political, military, and economic information; pen portraits of prominent people; and rumors and whispers overheard at the court. In addition

to conducting diplomacy, embassy staff members were engaged in espionage, and duplicity, bribery, and subversion became ubiquitous tools of diplomacy. As English diplomat Sir Henry Wotton (1568–1639) allegedly quipped, “An ambassador is an honest man, sent abroad to lie for the good of his country.” At the same time the diplomatic officials were granted sanctity of person, and any abuse directed against them was considered a breach of honor and insult to a state.

China had one of the most sophisticated diplomatic systems, which flourished under the Ming dynasty (1368–1644). The Ming emperor received numerous foreign envoys at the capital at Nanjing but also sent diplomatic missions, the most famous of which was the enormous tributary missions and expeditions of Admiral Zheng He (1371–1433), who sailed with the imperial fleet throughout Asia and eastern Africa. These expeditions ended in 1433, and the Chinese state limited its diplomatic engagements with the outside world, although it did maintain contacts with the newly arriving Europeans. The Chinese practice of kowtow (*kòu tóu*), a reverential deep bow to the ground that everyone presented to the emperor had to perform, proved to be a major issue of contention for European diplomats, who interpreted it as a sign of submission to the Chinese ruler. Similarly, during its expansion, the Ottoman empire generally employed unilateral nonreciprocal diplomacy when dealing with European states (e.g., Venice, the Habsburg empire, Poland). Thus, in his negotiations with European states, very rarely did the sultan treat their rulers as equals, and he usually claimed to have unilaterally granted peace or trade concessions at his own discretion. The Treaty of Karlowitz and the Treaty of Passarowitz, signed according to Western diplomatic norms in 1699 and 1718, respectively, signaled

a change in the status of the Ottoman empire. It was no longer an expanding power but instead was now a retracting power.

While diplomacy was vigorously pursued, the possibility of war was taken for granted throughout the world. Yet the nature of warfare changed profoundly between 1450 and 1770. The sixteenth and seventeenth centuries particularly marked a turning point in virtually all aspects of war. Army organization, strategies and tactics, and weapons went through major transformations. In 1450 Europeans were relatively inconsequential on the world stage. Constantly fighting against each other, they failed to halt the Ottoman destruction of the Byzantine empire and subsequent advances into the Balkans. By 1529 the Ottomans threatened Vienna at the very heart of Europe. Meanwhile, the Chinese were for a time the dominant power in Asian waters. In the early fifteenth century China's fleets were far larger than anything Europeans could deploy. There were several dynamic non-European powers; conflicts in the fifteenth- and sixteenth-century world did not necessarily center around Europeans. For instance, in 1526 Babur, a Muslim conqueror from central Asia, won one of the most decisive battles of the century at Panipat and established the Mughal dynasty in northern India. The revived Mongol state led by Altan Khan launched new attacks on Ming China. Toyotomi Hideyoshi united Japan and launched major campaigns against Korea in the 1590s. Meanwhile, Sapa Inca ("paramount leader") Pachacuti (ca. 1438–ca. 1471) and his successor Túpac Inca (ca. 1471–ca. 1493) expanded the borders of the Inca state to include most of the eastern coastline of South America. In central Mexico, the Triple Alliance of Tenochtitlan, Texcoco, and Tlacopan extended its power from the Gulf of Mexico to the Pacific shore.

Three hundred years later, European militaries were qualitatively superior to those of the rest of the world and spread across the entire globe. The seventeenth century marked a gradual but consequential shift in global power. Europeans checked the Ottoman advances at Vienna (1529), Malta (1565), and Lepanto (1570). European warships in the Indian Ocean destroyed the leading Indian and Ottoman fleets, and European trade and military strength began to make its impact in the Indian and Atlantic oceans. Spanish forces overthrew the Aztec and Inca states, a process greatly aided by European diseases. Of course, European impact was not universally strong, and much of Asia successfully resisted European inroads while adopting some European military techniques and weapons. China remained the strongest and most expansive state in East Asia, successfully controlling the Dutch in Formosa (Taiwan) in the 1660s and preventing Russian advances in the Amur Valley in the 1680s. The Omani Arabs expelled the Portuguese from East Africa in the 1690s, and the Ottomans continued to display remarkable resilience and success against European attacks in the early eighteenth century. Nevertheless, throughout this period European armies and navies succeeded in carving out global empires, as their superior military technology and tactics gave them major advantages over American and African states. European maritime dominance was of particular importance; it allowed Europeans to control maritime lanes to conduct

profitable trade that, in turn, sustained further expansion. This meant that it was Europeans who sailed off the coast of Asia, the Americas, or Africa and not the other way around. Europeans explored the world, charted the oceans, established markets, traded goods, and acquired the knowledge that further strengthened them. For example, the dominance of Spanish fleets in the Atlantic in the sixteenth century explains that empire's vast wealth. England's rise to global power rests primarily on its command of the seas. After the defeat of the Spanish Armada in

1588 and of the Dutch fleets in the seventeenth century, the English fleet became the world's most powerful naval force by the late eighteenth century.

However, certain qualifications must be placed on the above-mentioned generalization concerning European military superiority. Scholars often highlight European success while overlooking (or intentionally ignoring) differences in military priorities between European

and local states. For example, while the Portuguese secured their naval dominance in the Indian Ocean in the sixteenth century, China was occupied with expelling the Mongols, expanding into Korea, suppressing domestic turmoil, and curtailing Japanese pirates. Although the Portuguese and the Chinese did not fight a major war, a Chinese fleet, employing cannons, defeated a Portuguese squadron off Tunmên in 1522. Yet China, like other East Asian naval powers (Japan and Korea), did not attempt to challenge the Portuguese presence in the Indian Ocean since it had no interests in overseas territories and limited itself to protecting its shorelines. One wonders what would have happened if the Chinese continued to deploy large numbers of warships as they did prior to 1433.

The changes in the theory and practice of warfare over these three centuries proved to be so profound that many scholars often refer to this period as the era of the Military Revolution. The development was both cause and consequence of the transition from feudalism to capitalism, the emergence of early modern nation-states, and the formation of overseas empires. The introduction of gunpowder weapons was an important component of the Military Revolution. Gunpowder, invented in China by the 900s, had been earlier utilized by Chinese and some Asian states and reached Europe in the 1200s. In other parts of the world social, cultural, political, and economic environments prevented large-scale adaptation of gunpowder weapons. Thus, in Iran and Egypt local elites were reluctant to use gunpowder technology because of the perceived un-Islamic and dishonorable nature of these weapons. Furthermore, Iran was less urbanized than the Ottoman empire or India and was dominated by a powerful tribal aristocracy that traditionally relied on heavy cavalry. This aristocracy resisted the introduction of new technology that threatened its status, while the Iranian rulers, lacking urbanized centers, lacked sufficient funds to draw upon in building a modernized army. In India the Mughals made limited use of cannons and hand weapons, since it was their cavalry that brought them military superiority on the battlefield.

After the defeat of the Spanish Armada in 1588 and of the Dutch fleets in the seventeenth century, the English fleet became the world's most powerful naval force by the late eighteenth century.

Europe proved to be more receptive and by the mid-1400s experienced the gunpowder revolution that permanently transformed the nature of warfare. The change came slowly, since until the discovery of the process of corning (rolling and dampening), gunpowder was highly volatile and presented as much danger to its maker and user as to the intended victim. In 1460 Scotland's King James II was killed by one of his own malfunctioning guns. Europeans excelled in the art of gun making. Drawing upon their long experience of casting church bells, Europeans produced guns from a single cast, resulting in cannons much stronger than could be made by fusing together individual pieces of metal. The gunpowder artillery transformed siege warfare, as medieval castles proved to be vulnerable to artillery bombardments. In 1453 a renegade European master in the Ottoman service produced massive guns, called bombards, that decimated Constantinople's defenses and led to the city's fall in just six weeks. Similarly, Charles VIII's invasion of Italy in 1494 clearly demonstrated the potency of siege artillery as the French captured fortresses in quick succession. This led to the development of *trace italienne*, or star-shaped fortresses, that could successfully withstand artillery barrages. The most effective fortress designs were those of French engineer Sébastien Le Prestre de Vauban, who created dozens of fortresses employing bastions, ramparts, and angled fortifications to create interlocking fields of fire. Cannons also found use in the navy. By cutting gun ports in their hulls, Europeans turned their multisail ships, designed for the rough seas of the Atlantic, into powerful weapons that gave them a decisive advantage at sea from the late fifteenth century onward.

European smiths also created a portable hand-held ballistic weapon, the arquebus, an early muzzle-loaded firearm that appeared in some European armies by the late fifteenth century. Such firearms soon assumed the leading role in European armies because they reduced the overall skill level needed for military service. For example, it took years of practice to train a longbow archer, while almost any man could use a gunpowder weapon after a brief training period. Incremental refinements to the arquebus led to the matchlock musket (which used a burning wick to ignite gunpowder) in the early seventeenth century and to the flintlock musket (which was operated by the strike of flint upon a steel plate) by the eighteenth century. However, early small arms were notoriously inaccurate and required men to fire in large volleys without aiming; rifling, which imparts a spin on projectiles and increases their accuracy and range, remained limited. In the 1690s the invention of the ring bayonet, which could be fixed upon a musket, allowed the infantrymen to defend themselves between volleys.

Some of the factors that contributed to the European adaption of gunpowder weapons include a political instability that produced continued intrastate rivalry and warfare that sustained military innovation, a relative free-enterprise system, and the availability of key natural resources (e.g., iron, coal, etc.). Medieval European warfare had been dominated by heavily armored cavalry, but its power was waning even before the arrival of gunpowder weapons. This was in contrast to the Islamic powers (Mamluk Egypt and Safavid Iran) and Japan, where the

power of mounted warriors (mamluks and samurai) remained strong enough to resist the introduction of gunpowder weapons that would have undermined their status and authority. By the early sixteenth century some European armies revived an emphasis on the use of infantry. Thus, the Spanish army led the way in creating permanent infantry regiments, called *tercios*, that utilized pikes and gunpowder weapons and combined mobility and firepower. The Spanish success in Italy, where tercios established their value against French and Italian armies, proved contagious, and other European countries adopted new tactics. To fire gunpowder weapons effectively in volleys required getting men to complete a series of requisite steps in concert. Dutch prince and military reformer Maurice of Nassau created modern drill tactics that were based on uniform and intense discipline and new tactical formations. Maurice and King Gustavus Adolphus of Sweden developed new linear formations that featured soldiers armed with firearms lined up in rows, usually six to ten men deep. As the first line fired, soldiers moved to the back to reload, allowing the second line to open fire. This continuous rate of fire proved to be deadly effective, as revealed in the experiences of the Thirty Years' War (1618–1648) and subsequent conflicts.

The gunpowder technology did not remain exclusively in the hands of Europeans. Other nations quickly realized its advantages over traditional cavalry or missile troops and successfully implemented it. Thus, in the 1520s Babur employed men armed with matchlock muskets and field artillery against the Lodis and Rajputs, whose armies used no firearms. In Iran the Safavids, whose lack of gunpowder technology played a decisive role in their defeat against the Ottomans in 1514, quickly adopted the new technology. Thus, in 1528 the Safavid artillery played

an important part in the Iranian victory over the Uzbeks at Jam (1528). In Africa, the Songhai cavalry suffered heavily from Moroccan musketry at Tondibi (1591). Yet firepower was not always the decisive factor in winning a war. For example, European cannons were less effective against African earthwork fortifications. More importantly, there was a difference in understanding the very nature of warfare. In Mesoamerica in the early 1520s the Aztecs

Yet firepower was not always the decisive factor in winning a war. For example, European cannons were less effective against African earthwork fortifications. More importantly, there was a difference in understanding the very nature of warfare.

suffered defeat not because of Spanish firearms but in part because of their different cultural conceptions of warfare in which capturing enemy soldiers, not taking enemy territory and destroying its state, was the principal goal. Europeans, on the other hand, inherited Greek and Roman concepts of war that stressed killing, not capture.

In Europe the Military Revolution became closely intertwined with the transition from feudalism to capitalism and the rise of the nation-states. Prior to the fifteenth century, many European states relied on mercenary forces or private armies-for-hire (e.g., condottiere). Yet by the late seventeenth century, mercenary armies all but disappeared from Europe and were replaced by large armies of mobilized conscripts commanded by officers commissioned by sovereigns. Military administration

became highly centralized. For example, Oliver Cromwell's New Model Army, established in 1645, imposed a common form on all English forces, including the famous redcoat uniform. The gradual increase in the size of armies as well the cost to maintain them meant that only the wealthiest states could afford militarization. The balance of power in the world thus shifted in favor of those who could centralize their authority, expand their bureaucracies, and intensify taxation to gather resources necessary for the conduct of war. The power of kings and emperors grew, leading to the establishment of the so-called gunpowder empires of Spain, France, and England in western Europe; the Ottomans and Safavids in the Middle East; and the Mughals in India. Thus, in France the government of Louis XIV created a vast bureaucracy that handled the daily tasks of maintaining the largest army in Europe, which allowed France to exercise its authority over the entire continent.

Initially recruitment of infantrymen was accomplished through contracts for mercenaries. Prior to the seventeenth century, warfare was a seasonal affair. Most campaigning occurred between late spring and autumn, and few wars lasted longer than two or three consecutive campaigns. Hiring mercenaries for a brief period of time therefore made financial and military sense. However, mercenary recruitment oftentimes brought marginal elements of society into the army. Many of them were beggars, debtors, or criminals who enlisted for the lure of modest payments and potential plunder. Unit cohesion and loyalty were largely nonexistent, and levels of desertion were extraordinarily high. Mass disbanding at the end of the war often led to local violence and vagrancy. The nature of military service changed in the late seventeenth century, including changes in the character of recruitment and army life. The continued warfare meant that demand for soldiers was too great to rely on voluntary enlistment or mercenary contracts. Some states experimented with conscripting parts of their populations. Thus, in Sweden conscription of a part of the peasantry established a core of career soldiers around which the Swedish army was formed. In France conscript local militias were used from the 1680s, while in early-eighteenth-century Russia annual levies specified a proportion of peasants destined for permanent military service. The establishment of these permanent armies changed the life of the soldier. In return for regular pay, more rigorous standards of discipline were demanded, and soldiering turned into a full-time occupation.

Newly established military bureaucracies supervised details concerning recruitment, equipment, and service; uniforms were standardized, partly to inspire unit cohesion and to eliminate individuality from military service. Soldiers became separated from civilian life and contained within barracks, with their heavy emphasis on drill and military duties. A permanent army meant the existence of a number of permanent units, which eventually served as the source of group identity, loyalty, and rivalry with other units. At the same time, soldiers received some assurance of being supported in old age or disability, and this period witnessed the establishment of the first modern pensions and hospitals. The *Hôtel des Invalides*, founded in 1670 on the outskirts of Paris, was the first of many hospitals for military veterans. Mass armies produced

important social change, as they undermined the status of military elites. In Japan the military elite succeeded in preventing this change. After drawing on guns, provided by Europeans, to unite Japan, the Tokugawa shoguns banned guns in the seventeenth century and preserved the existing social order (with samurai holding top position in the Japanese society) well into the nineteenth century. In Europe the nobles, while losing their monopoly on military power, continued to play an important military role as officers. In the Ottoman empire the Janissaries, elite troops of male Christian children levied through the *devshirme* system (a tax also known as the child-collection tax in which Christian boys from the Balkans and Anatolia were taken from their homes, enslaved, and converted to Islam) from conquered Christian countries came to wield such prestige and influence that they dominated the government and blocked any reforms that threatened their status.

In Europe the rise of the new warfare had a terrible impact on human experiences of war. During the Thirty Years' War (1618–1648) as many as 1 million men served as mercenaries, and failing to receive regular

payments, they often turned to plundering, pillaging, and raping. Germany, which saw most of the action during this war, was thoroughly devastated, as entire villages were wiped out and towns sacked. Some estimates suggest that over 7 million civilians were killed in Germany during the war. Similarly devastating was the English Civil War (1642–1648). As fire-arm technology matured, battles resulted

During the Thirty Years' War (1618–1648) as many as 1 million men served as mercenaries, and failing to receive regular payments, they often turned to plundering, pillaging, and raping.

in heavier casualties. At Malplaquet in 1709, direct charges against musketeers led to over 30,000 casualties in just seven hours that were vastly disproportionate to desired political and military aims. By the early eighteenth century improvements in military technology and the onset of the Enlightenment led to rethinking of the nature of warfare. Emphasizing rationality, European thinkers believed that armies motivated by religion or ideology were irrational and too dangerous. The European thinkers urged moving away from pitched battles that produced carnage to fight more “rational” wars for limited gains and at limited cost. Thus, in the eighteenth century armies no longer sought to destroy their foes in decisive battles, and instead methodical operational warfare became a mainstay.

Europe's ability to seize an early lead in the gunpowder revolution produced an increase in warfare on the European continent but also expansion of European military power at the expense of non-European states. Between 1450 and 1750 there was an unprecedented spate of wars and revolutions throughout the world. Looking at the seventeenth century alone, one is struck by the fact that only 2 years (1670 and 1682) in an entire century were without a war between the European states. Looking at individual states, we see that between 1618 and 1678 the Dutch Republic was at peace for only 14 years, France was at peace for only 11 years, and Spain was at peace for only 3 years! These wars produced unparalleled political, social, and religious changes. The

prolonged Hundred Years' War ended in 1453 with a victory for France, while for England the loss of its continental possessions profoundly affected the development of that country for the next 500 years. In 1494 France attempted to expand its power to rich Italian states but became embroiled in a long conflict with Spain. By the end of the Italian Wars in 1559 Habsburg Spain had been established as the premier power of Europe, while the Italian states, which had wielded so much power during the Renaissance, were from now on reduced to second- and third-rate powers. Defeated in this conflict, France was plunged into a long political and religious strife that came to an end in 1589. In the meantime, England successfully dealt with the Spanish threat in 1588 and supported the Dutch rebels, who in 1648 secured their independence from Spain after 80 years of struggle. These conflicts sapped Spanish resources, and by the late seventeenth century Spain had entered a long period of decline. In the mid-sixteenth century Germany saw the beginning of religious conflict that continued for almost a hundred years. The Thirty Years' War produced devastation on an unparalleled scale in Germany, which lost up to a quarter of its population, while entire regions were laid to waste. Yet this war also marked the rise of France as a great power on the continent, and European states spent subsequent decades seeking to contain the French hegemony. Louis XIV involved France in several costly military campaigns culminating in the War of the Spanish Succession (1701–1714) that almost bankrupted France and ended its dominion over continental Europe. At the same time, the prolonged Great Northern War (1700–1721) ended in the defeat of Sweden and the rise of Russia as a dominant power in northeastern Europe.

The European penchant for war was shared by other regions of the world. In fifteenth-century Japan increased rivalry between daimyos (lords) and a dispute over shogunal succession led to the era of the Warring States, an era of nearly continuous military conflict and profound social and political upheaval that lasted until the early seventeenth century. The introduction of European firearms in the mid-sixteenth century proved to be a turning point in the Japanese civil strife. Oda Nobunaga, a samurai of the lesser daimyo ranks, used European military technology to defeat neighboring lords and extend his power to a large part of Japan. Following Nobunaga's death, one of his generals, Toyotomi Hideyoshi, completed the unification of Japan and pursued expansionist policies, organizing two massive (but unsuccessful) invasions of Korea between 1592 and 1598. Hideyoshi's death in 1598 provoked a power struggle that was won by Tokugawa Ieyasu in the decisive Battle of Sekigahara in 1600. Tokugawa's victory marked the beginning of the Tokugawa shogunate that lasted until 1868. While the emperor retained sovereign authority, the real authority and power was in the hands of the Tokugawa shoguns, who brought peace, stability, and economic growth to Japan while isolating it from the rest of the world.

In Southeast Asia, warfare between local states remained traditional, and the effect of gunpowder weapons was negligible. The Burmese kingdom of Toungoo conquered Pegu and Ava during the 1530s–1540s and seized Lan Na in 1556 and the Thai capital of Ayuthia in 1564. In the early eighteenth century the Mon (Talaing) Rebellion threw off the rule of the

Toungoo dynasty and led to the establishment of a Mon kingdom at Pegu. The Mon conquered the Burmese capital of Ava in 1752 but suffered defeats at the hands of Alaungpaya during 1754–1757. Alaungpaya eventually established the Konbaung dynasty that seized Tenasserim in 1757 and Manipur in 1759 and ravaged Siam and Laos in the 1760s. The arrival of Europeans had an important effect in the East Indies, where the Dutch East India Company gradually acquired sovereignty over the local states.

Gunpowder technology also played an important role in the struggle between Hindu and Muslim states in India. In 1526 Babur, a descendant of Timur, invaded northern India and defeated the army of the sultanate of Delhi, establishing the Mughal state. His successors conducted a series of victorious campaigns that brought Bengal (1575–1576), Kashmir (1585–1589), Tatta (1586–1593), and Gujarat (1572–1573) and Bijapur, Golconda and Baltistan (1630s) under Mughal authority. The Indian states developed armies that featured traditional cavalry, led by the local nobility, and a European artillery corps, often financed by a royal monopoly on precious stones. Vulnerability of existing fortresses and castles to artillery bombardments encouraged construction of less exposed fortifications that featured bastions similar to those in Europe. In the early eighteenth century the Mughal authority rapidly declined and was threatened by the rising power of the Hindu Marathas. Yet the invasions of Nadir Shah (1739–1741) and Ahmad Khan Abdali (1752–1762) greatly weakened both the Mughals and the Marathas, accelerating tendencies toward regionalism and fragmentation. This allowed the British East India Company to consolidate its power base in Bengal and Bihar and conduct successful campaigns to expand its authority throughout India.

In the early sixteenth century Altan Khan, a descendant of Chinggis Khan, united Mongol tribes once again and used their military strength to threaten Ming dynasty China. Between 1529 and 1570 he led several raids into China, crossing the Great Wall, besieging Beijing itself, and compelling the Chinese emperor to grant favorable trading rights to the

Mongol khanate. In response to the Mongol attacks, the Chinese developed mobile artillery and upgraded the Great Wall to accommodate musketeers, although the bulk of the Chinese army remained armed with traditional weapons. The early experience with gunpowder in China ensured that its fortified cities had very thick walls capable of withstanding artillery. The Ming dynasty's weakness in the first half of the seventeenth century was accompa-

nied by the rise of the Manchu state in Manchuria as a major power. After expanding their authority to Korea and Inner Mongolia, the Manchus entered China during a large-scale rebellion and replaced the Ming dynasty in 1644. The Ming resistance endured in the south of China, and sporadic warfare lasted for decades until the long reign of K'ang-hsi produced consolidation of central authority in the early eighteenth century.

By the late sixteenth century the Ottoman empire was one of the world's most powerful empires. During the reign of Sultan Mehmed II

In response to the Mongol attacks, the Chinese developed mobile artillery and upgraded the Great Wall to accommodate musketeers, although the bulk of the Chinese army remained armed with traditional weapons.

(1451–1481) the Ottoman realm rapidly expanded. With almost all of Anatolia under his control, Mehmed II besieged Constantinople, the capital of the once-mighty Byzantine empire, and captured it in May 1453. The loss of Constantinople exposed eastern Europe to a wave of Ottoman expansion. Although Mehmed's death was followed by a struggle for succession, major expansion resumed under Sultan Selim I (1512–1520). The Ottoman army by now had become a mixed force that featured traditional cavalry, infantry equipped with handguns, and field artillery. This military potential allowed Selim to conduct triumphant campaigns in the east, defeating the Safavid army at Chaldiran in August 1514 and capturing Syria and Palestine in 1516 and Egypt in 1517. Firepower was decisive in the Ottoman victories in Iran and Egypt. The conquest of Egypt and its vital port of Alexandria allowed growth in Ottoman naval strength in the Mediterranean. By the end of Selim's rule, the Ottoman state extended from Iraq to Serbia and from Anatolia to Tunisia.

Selim's son Suleiman (1520–1566) only further enhanced the Ottoman supremacy as he led his armies on 13 major campaigns and numerous minor ones. In 1526 he crushed the Hungarian army at Mohacs, and after overrunning most of Hungary he besieged (unsuccessfully) the Austrian capital of Vienna in 1529. The conquest of Iraq in 1534 was followed by Aden in 1538 and Massawa (on the Ethiopian coast) in 1557, while the Ottoman authority extended along the coast of North Africa to Algiers. The Ottomans also achieved considerable success in the eastern Mediterranean Sea, although they failed to capture Malta in 1565 and suffered defeat at Lepanto in 1571. Suleiman's reign proved to be the Golden Age of the Ottoman empire, and the next two centuries saw its gradual decline. In the seventeenth and eighteenth centuries the Ottomans did show occasional glimpses of the past grandeur but were largely on the defensive. During the tenure of the capable grand viziers from the Koprulu family, major domestic reforms and vigorous foreign policies were attempted, but they ultimately failed to produce decisive results. The Ottoman siege of Vienna in 1683 was the last time the Ottomans seriously threatened central Europe. The subsequent Treaty of Karlowitz (1699) marked a turning point in Ottoman history, as Sultan Mustafa II (1695–1703) was forced to surrender Hungary and Transylvania to Austria. In the eighteenth century the Ottomans were engaged in prolonged conflicts against the European states—most importantly against the rising Russian empire, which fought the Ottomans five times within that century—that exhausted Ottoman treasuries and contributed to internal turmoil.

In the early sixteenth century Iran emerged as a powerful state under the leadership of the Safavid dynasty. Yet this process was fraught with challenges. In 1514 the Safavids suffered a devastating defeat at Chaldiran, and in the mid-sixteenth century repeated Ottoman attacks kept Safavid power in check. The situation, however, changed with the accession of Shah Abbas to the Iranian throne. A brilliant statesman and commander, Shah Abbas presided over rapid territorial expansion and a cultural and economic blossoming. To consolidate his rule, Abbas modernized his army by importing European gunpowder technology, establishing an artillery corps, and creating a standing army of slave-soldiers

known as ghulams that he used to suppress domestic revolts and coerce disloyal provinces into submission. Abbas used this military might to expand his sphere of influence to the Caucasus, Iraq, and central Asia. Shah Abbas's death in 1629 marked a watershed moment in Iran's history. Most shahs after him lacked the necessary skills and experience, and the country suffered from internal divisions and turmoil. In 1722 the Afghan tribes invaded Iran and overthrew the Safavids. Over the next decade the country was torn by vicious civil strife as various pretenders fought for the crown. Nadir Khan of the Afshar tribe emerged as victor in this conflict, and in 1736 he proclaimed himself as shah. Nadir was a brilliant military commander whose campaigns revived an Iranian empire that extended from Georgia to India. Yet despite his successes, Nadir had come to be regarded as a cruel and capricious tyrant and faced a number of internal revolts and conspiracies, one of which resulted in his assassination in 1747. His death once more plunged Iran into a civil war that continued for three years and led to the rise of the Zand dynasty. Although its founder Karim Khan proved himself as a capable commander who reclaimed all of Iran by 1760, his success proved to be fleeting, and political disorder and economic decline characterized Iranian life. His death in 1779 led to another round of violence that only further weakened the Iranian state.

African warfare featured a variety of conflicts between African states, between native Africans and Europeans, and between non-African powers. The nature of African warfare was transformed by the introduction of firepower and the use of larger armies. In sub-Saharan Africa, shock warfare featuring hand-to-hand fighting in "open" order and missile tactics (the use of javelins, bows, etc.) prevailed until the use of firearms. This style of warfare had important social consequences, since it was rather selective in its manpower requirements and supported a social hierarchy. The spread of gunpowder changed this hierarchy as African states (e.g., Akwamu and Denkyira) began to conscript all males fit to bear arms. Still, gunpowder technology spread in

sub-Saharan Africa over a long time span and was not fully established until the 1770s. European colonization attempts certainly contributed to this process but also revealed the limitations of European musketeers, who struggled to adjust to the open-order fighting methods of their opponents. Throughout the seventeenth century European operations in West Africa were restricted to coastal possessions as diseases, difficult terrain, and local resistance prevented further expansion. In most cases Europeans achieved success against local states only when they oper-

ated in combination with African soldiers. In East Africa local African states were not naval powers, and this allowed the Portuguese to establish colonies in the sixteenth century. Yet 100 years later the Portuguese

Throughout the seventeenth century European operations in West Africa were restricted to coastal possessions as diseases, difficult terrain, and local resistance prevented further expansion. In most cases Europeans achieved success against local states only when they operated in combination with African soldiers.

hegemony was threatened by the Omani Arabs, who sacked Mombasa in 1661, raided Mozambique in 1670, and captured the Portuguese Fort Jesus in 1698. The Portuguese regained Mombasa in 1728 after a local mutiny but lost it again in 1729. In southern Africa the Dutch established a successful colony at Cape Colony, but their expansion to the east encountered the Xhosa, whose resistance delayed European expansion into the south African hinterland.

Throughout the sixteenth and seventeenth centuries Africa also experienced several important conflicts between non-African powers. Spain and Portugal conducted operations

against Muslim states in North Africa. The Anglo-Dutch rivalry in Europe spilled over to the Guinea coast in the second half of the seventeenth century. Similarly, struggles between Spain and the Dutch oftentimes unfolded along the Gold Coast. At the same time, Ottoman authority declined in North Africa during the early eighteenth century as Algeria, Tunisia, Tripolitania, and the Egyptian Mamluks gained greater sovereignty. The first three states became known as Barbary States to Europeans and were involved in numerous wars against both each other and European states.

■ Introduction: Ideologies of Domination

People develop ideologies to justify and sustain every conflict. European explorers and conquistadors in the newly discovered Americas believed that they were doing God's bidding, subduing people in order to save their souls. Christopher Columbus's letter to the Spanish monarchs, written on his first voyage to the unknown land, provides clear evidence for the desire that guided him: "And Your Highnesses, as Catholic Christians and Princes devoted to the Holy Christian Faith and the propagators thereof, and enemies of the sect of Mahomet and of all idolatries and heresies, resolved to send me . . . to the said regions . . . to observe the manner in which may be undertaken their conversion to our Holy Faith." The Portuguese explorer Bartholomew Diaz echoed this sentiment, explaining his actions as motivated by his desire "to serve God and His Majesty, to give light to those who were in darkness." Similar sentiments can also be found in the Ottoman or Safavid policies, which oftentimes called for a holy war in defense of or to spread Islam.

However, such religious rhetoric often concealed more pragmatic motives. Thus, Spanish rulers Ferdinand and Isabella's claim to being "Catholic Kings" and their struggle against the Moors went hand in hand with their political motives of consolidating their power. In

seventeenth-century France, Cardinal Richelieu's approach to political philosophy often contradicted traditional Christian views, which he supplanted with the concept of *raison d'état*. The French state was a Christian state governed by a Christian king, Richelieu reasoned; therefore, whatever was done for the state was done for God. Such political philosophy justified expanding authority of the state and its domination, if not outright repression. As the cardinal famously put it, "God absolves actions which, if privately committed, would be a crime." French bishop Jacques-Benigne Bossuet further elaborated this ideology, arguing that "the royal throne is not the throne of man, but the throne of God Himself." The king's duty to God should be the only constraint on his power.

In China, on the other hand, the idea of the Mandate of Heaven was a central concept in China's political philosophy. Under this concept, heaven granted a mystical mandate to virtuous rulers whose actions determined the success or failure of their dynasty and the state. The more virtuous the ruler, the greater the mandate to rule. Rebellions, civil wars, invasions, famine, and plagues were common signs that a dynasty had lost the mandate to rule, and that a new ruling house would soon appear.

The *Ain-i Akbari*—Akbar’s Empire in a Book

The *Ain-i Akbari* (literally Akbar’s Law, better translated as the Register of Akbar’s Empire) of Abu al-Fazl Allami is a massive and detailed description of the government and empire of the Mughal emperor Akbar (r. 1556–1605). Although the *Ain* runs to three volumes and more than 1,600 pages, it is itself the third volume of a larger work, the *Akbar-namah*, the official chronicle of Akbar’s reign. Abu al-Fazl was the principal architect of Akbar’s political program, not merely his biographer. The *Akbar-Namah* and thus the *Ain* articulate that program and do not merely record and describe. The historical part of the work depicts Akbar’s sovereignty as the outcome of human history, for it starts with Adam, and more specifically the Chingiz-Khanid and Timurid claims to universal monarchy. Abu al-Fazl says himself that “my sole object in writing this work was, first to impart to all that take an interest in this auspicious century, the wisdom, magnanimity, and energy of him who understands the minutest indications of all things, created and divine . . . and secondly to leave future generations a noble legacy” (1:152). He certainly achieved the latter goal.

The *Ain* consists of four books. The first describes Akbar’s imperial household; the second is a gazetteer of the empire, with a description of the provinces and provincial administration; and the third is primarily an anthropological description of the culture of Hindustan (the northern third of the Indian subcontinent) but includes such other material as a collection of Akbar’s sayings. Each part of Abu al-Fazl’s work connects to his conception of Akbar’s kingship. As the first excerpt indicates, he depicts kingship as a light emanating from God, a concept that dates back to pre-Islamic Iran. In Abu al-Fazl’s description of the insignia of royalty, he explains that kings “are fond of external splendor because they consider it an image of Divine glory” (1:52). He blames animosity between adherents of different religions on “the apathy of princes” (3:5), thus praising Akbar’s religious policy of *sulh-i kull* (peace with all, equal treatment of all religions) by implication.

Book I is a treasure trove of information on a variety of issues. It describes all of the products

of the imperial workshops, including coinage, tents, carpets, paintings, clothing, and weapons; the care and equipment of animals, including elephants, horses, camel, bovines, and mules; the imperial kitchen, including recipes and food prices; and the imperial construction program and building materials. Since the ruler was both the greatest consumer and the greatest industrialist of the empire, the descriptions provide immensely valuable data on economic history and the history of technology as well as art and culture. Abu al-Fazl’s comments on imperial artillery make clear that he regards the possession of guns as a mark of the security and splendor of the empire; guns were thus not merely practical weapons. He praises Akbar for devising several innovative weapons.

The unique value of Book I, however, lies in the descriptions of court routines, rituals, and etiquette and of Akbar’s role as a spiritual guide. Here, Abu al-Fazl presents the image of Akbar as Akbar wished to be seen. Abu al-Fazl, in his own words, ignores “those weak-minded zealots” who accuse Akbar of worshipping the sun and fire, choosing to “dismiss them with a smile” (1:164). Abu al-Fazl depicts Akbar not as a prophet but as a spiritual guide, defining that role as an extension of his kingship. Seekers of enlightenment from all religious backgrounds benefit from his insight and his blessing. The official description of Akbar’s personal religious order, the *Din-i Ilahi*, is in Book I. The explanation of court rituals defines making obeisance to the ruler as a privilege; the higher the rank of the individual, the closer the approach and the deeper the bow. The rituals thus assert that status depends on submission to the ruler; the deeper the submission, the higher the rank. The *Ain*’s description of court rituals continues in Book II with an explanation of the weighing ceremonies on Akbar’s solar and lunar birthdays, in which the emperor was weighed against such commodities as gold, silver, and tin and various grains, drugs, and fruits and the equivalent weights in these commodities given away. Akbar instituted these rituals, which followed Hindu models and helped to articulate Akbar’s sovereignty in a manner recognizable to Hindus.

Most of Book II, however, deals with Akbar’s military establishment, aspects of administration,

hunting, and amusements. Abu al-Fazl provides only a brief description of the *mansabdari* system, the system of numerical ranks that provided the military and administrative framework of the empire, and does not provide a systematic description of the Mughal bureaucracy; he devotes more attention to hunting, one of the standard activities of kings. His treatment of the military establishment is somewhat distorted because he ignores the contingents maintained by Mughal officers, the vast majority of the Mughal army, describing only the various units that formed part of the court establishment.

Although most of Book III consists of a description of provincial administration and a gazetteer of the empire, the book begins with an account of various calendars including, most importantly, the Illahi calendar, which Akbar established to replace the Hijri (Muslim) calendar. The description of provincial administration emphasizes justice—the protection of cultivators from oppression—in revenue collection. The gazetteer includes description of administrative subdivisions, revenue data, and general background, including provincial histories, of the 12 provinces of the empire.

Most of the last book describes Hindu culture and philosophy. It also includes a list of outsiders who have come into India, from Adam to Akbar's father Humayun; a list of the Sufi saints of India; a collection of Akbar's sayings; and a brief autobiography. Abu al-Fazl did not know Sanskrit. He derived his knowledge of Hindu culture from the Hindu intellectuals connected to Akbar's court and from the *History of Hindustan* of al-Biruni. Abu al-Fazl does not add any particular insight, but his description goes beyond what would be necessary simply to provide justification for Akbar's treatment. Abu al-Fazl makes no explicit connection to Akbar's policy of *sulh-i kull* but asserts that Hindus are in fact monotheists, as the third excerpt shows. Abu al-Fazl's vision embraces a cultural synthesis parallel to the political synthesis that Akbar had already achieved.

The Mandate of Heaven

The idea of the Mandate of Heaven, which first appeared in China during the early Zhou dynasty (1027?–771 BCE), became a central concept in China's political philosophy and remained the primary intellectual foundation for the legitimacy of later imperial rule. The idea bears certain moral and political implications that are significant and problematic for the Chinese theory of political authority.

The earliest description of the concept of the Mandate of Heaven appeared in the *Book of Odes* and the *Book of Documents*, both believed to have been created during the early Zhou. At the time, the Zhou dynasty had defeated the Shang (1045 BCE) and was confronted with potential threats from the members of the old Shang ruling class. The crucial question for the Duke of Zhou, who now claimed political authority, was how to justify the conquest of the Shang and institute a government. He argued that the Zhou were able to conquer and succeed the Shang through the same qualities of virtue that had earlier enabled the founder of the Shang to overthrow and succeed the Xia. The Shang had received a mandate from Heaven to overthrow the Xia, but the descendants of the Shang had not been able to preserve the mandate. The Duke of Zhou argued that the Shang lost their mandate because their ruler ceased to cultivate virtue, and the Zhou received the mandate as a result of the virtuous conduct of their ruler.

This interpretation of the Mandate of Heaven idea contains two distinct implications that influenced the later development of the Chinese political system. First, it asserts that the Heavenly mandate is not unchangeable and is not bound to a particular dynasty. If the rulers do not continue to cultivate virtue, then Heaven can confer

➤ EMPEROR QIANLONG'S LETTER TO KING GEORGE III

In 1793 Emperor Qianlong of the Qing dynasty (1644–1911) addressed two imperial edicts to King George III of Britain, rejecting the request communicated by Lord Macartney to permit an ambassador to the imperial court and trading privileges. Qianlong's letters asked how Britain could expect the Celestial Kingdom to alter its traditional regulations to meet the mundane desires of barbarians. Qianlong asserted also that since the beginning of history China had had a moral system monitored by wise rulers, and "there has been no hankering after heterodox doctrines." Following the Confucian tradition, China's emperor saw changes as threats and looked to the past to find ways to preserve the Confucian imperial state. As he observed:

"Swaying the wide world, I have but one aim in view, namely, to maintain a perfect governance

and to fulfill the duties of the state: strange and costly objects do not interest me. If I have commanded that the tribute offerings sent by you, O King, are to be accepted, this was solely in consideration for the spirit which prompted you to dispatch them from afar. Our dynasty's majestic virtue has penetrated unto every country under heaven, and kings of all nations have offered their costly tribute by land and sea. As your Ambassador can see for himself, we possess all things."

the mandate on another king or dynasty. Political authority, therefore, is believed to be based on objective, universal moral criteria rather than on power or lineage. This faith in political rule by virtue, however, does not diminish the fact that the victory of a new dynasty ultimately depends on power. Questions of how the Mandate of Heaven would be transmitted and how political rulers would manifest their virtue remained unresolved by China's political theorists.

Second, the idea that the Mandate of Heaven is conferred on one man of exceptional virtue implies that political order can be inaugurated and maintained only by the support of an elite. This view assumes the need for hierarchy and political order, which can only be maintained by men who have made themselves virtuous and are therefore entitled to govern. In addition, this view places great emphasis on human effort to cultivate virtue in order to serve Heaven, a view developed in detail later by Confucians.

The term "Mandate of Heaven" gained wide application in Confucius's time (ca. 551–479 BCE), but an idea of kingship that was compatible with the Zhou interpretation of the concept awaited further development by Mencius (371–289 BCE). In later Chinese thought, the Mandate of Heaven was linked to the idea that human

history cycles through periods of order and disorder, an idea widely appropriated by Chinese emperors and scholar-officials to explain the rise and fall of dynasties.

Kejawen—Religious Resistance on Java

Islam is the religion of the majority of Indonesians today and is especially entrenched on the island of Java. However, many Javanese have continued to hold to a set of indigenous beliefs termed *kejawen* (Javanese science), combining animist, Hindu, and Islamic elements. *Kejawen* stresses spiritual exercises such as meditation in order to attain a state of inner tranquility. Of central importance in this system are traditional ceremonies aimed at communicating with and placating

the spirit world. Powerful spirits are held to live at various points in Java, including mountains, the sea, and gravesites. *Kejawen*, however, is not an organized religion and possesses little in the way of clergy or a central scripture. Its followers do recognize a type of shaman (*dukun*) and venerate certain texts and folktales. Nor has *kejawen* directly rejected Islam but has, in fact, existed in symbiosis with Islamic practices.

At the beginning of the fifteenth century Java was dominated by the Majapahit empire. While the court practiced a local version of Hinduism and numerous temples dotted the landscape, the population retained many animist customs. By the middle of the century, however, this powerful Hindu empire was in decline. Muslim city-states emerged on the island's northern coast, and Islam slowly spread from these outposts into the interior. The emergence of *kejawen* as an identifiable set of beliefs is related to conversion to Islam, a process that continued until perhaps the end of the eighteenth century.

The form of Islam that developed in Java's interior blended elements common throughout the Islamic world with indigenous belief in the spirit realm and a reverence for local royalty. Javans viewed the rulers of Mataram, and later Yogyakarta and Surakarta, as descendants of the Majapahit Dynasty who consorted with the spirits of the mountains and the ocean while fulfilling the traditional roles of rulers. To this day, Javans hold that the sultan of Yogyakarta possesses supernatural abilities and enjoys an intimate relationship with Loro Kidul, a mythical marine goddess. The population, while nominally Muslim, devoted itself to appeasing the spirit world through modest ceremonies conducted with the help of shamans and exorcists in response to life crises. Importance was also placed on pilgrimages to holy places situated in the mountains and forests. Little attention was paid to regular prayer or study of the Quran. Although the veneration of the graves of holy men was common elsewhere in the Islamic world before the late nineteenth century, Muslim observers have viewed Javanese Islam with suspicion, and some Western scholars have even interpreted it as somehow un-Islamic. *Kejawen* could be seen as a type of religious belief and practice that goes beyond this form of Javanese

➤ CLIFFORD GEERTZ—*SANTRI, PRIYAYI, AND ABANGAN*

The nature of *kejawen* is connected to a terminology devised for the study of Javanese religion by American anthropologist Clifford Geertz (1926–2006). He divided Javanese society into three streams, *santri*, *priyayi*, and *abangan*. Although all three groups identified themselves as Muslim, they had very different ideas as to how this religion should actually be practiced. *Santri* took their commitment to Islamic regulations more seriously. Prayer, fasting, and the pilgrimage to Mecca were all central elements of *santri* life. The *priyayi* stressed refinement and the cultivation of inner peace and spiritual power through meditation, art, and mysticism. Some critics have questioned whether the *priyayi* is really a valid religious category at all and is not better understood as a sociological label for the minor Javanese aristocracy. The *abangan* stream was that of the rural peasant whose religious outlook was a syncretism that combined animism with Hinduism and Islam. The core ritual of the *abangan* variant was the *slametan*, a ritual intended to appease hostile spirits. *Kejawen* could be seen as simply a more defined version of the *abangan* stream, with more emphasis being placed on local traditions and a more obvious rejection of some of the Islamic practices associated with the *santri*. Much has changed since Geertz conducted his fieldwork in the late 1950s, especially as its rural society has come under increasing influence from a larger Pan-Indonesian society. Many Javanese have abandoned *abangan* or *kejawen* identities in favor of more self-consciously Islamic ones.

—Michael Wood

Islam. Islamic elements are downplayed in favor of indigenous elements. This has led some to claim that *kejawen* is not in fact Islamic at all but instead constitutes a separate religion.

Reconquista and Inquisition— Ethnic Cleansing in Early Modern Europe

The Reconquista, the war to expel the Muslims who had overtaken the Iberian Peninsula in 711, came to a lull in the fourteenth century after several hundred years of fighting. By this time, the only Muslim territory left was the Kingdom of Granada, which had been a tributary to Castile since 1282. Ferdinand and Isabella concluded a truce with Abu-I-Hasan Ali, the king of Granada, in 1478; however, they still began a series of frontier skirmishes throughout the 1480s. Outwardly their intentions to bring Granada under the power of the Castilian crown were religious, but their motives were also political, as the "Catholic Kings" had been making moves within the Spanish kingdoms to consolidate their power. In fact, their marriage in and of itself was a method of consolidating the power of the Castilian and Aragonese crowns. The Castilian army finally took possession of the Alhambra on January 1, 1492. While this ended the last sovereign Muslim state in the Iberian Peninsula, the Muslims of Granada were still allowed to retain their houses and mosques and to practice their religion freely, and those wishing to return to North Africa were provided a ship to do so.

The addition of Granada made it important for Fernando and Isabel to try to instill a homogenous identity among the people of their composite kingdoms. Part of this identity included religion, and they now turned to the Jews living in their midst. Thousands of Jews had already been converted to Christianity in 1391, but the descendants of the *conversos* were still looked upon with suspicion, even 100 years later. This suspicion of Judaizing prompted the Spanish

monarchs to apply to Pope Sixtus IV for an Inquisition, which he granted on November 1, 1478. Four inquisitions were established in Europe from the thirteenth to the sixteenth centuries: in France, Rome, Spain, and Portugal. The first two were established to combat heretics, and the second two were specifically established in order to root out crypto-Jews, or those Christian converts from Judaism who were suspected of secretly continuing to practice.

The Spanish Inquisition was a royal institution directed and controlled by the Consejo de la Suprema y General Inquisición, created in 1483. The monarchs appointed the officials, gave them instructions, and paid their salaries. This new Inquisition worked like the old medieval one established to seek out heresy: torture was used, and the accused were not given the names of their accusers. Executions were doled out at ceremonies called autos-de-fé whereby either the bodies or the effigies of the condemned were "relaxed" by being burned at the stake. The Inquisition was allowed to use methods such as confiscation of property, exile, and execution in order to seek out people they deemed to be false conversos. They did this with such ferocity that it shocked the pope, who was unable to temper their efforts.

On March 30, 1492, an edict was issued that all Jews in the kingdom had four months to either be baptized or leave the kingdom. Many converted, but many more chose to leave the kingdom; it is estimated that anywhere between 150,000 and 800,000 Jews left the kingdom. The loss of this segment of the population was devastating to the Spanish economy; many of the kingdom's financial resources were lost. These Sephardic Jews (as Spanish and Portuguese Jews are known) managed to resettle all across the Mediterranean; however, over 50,000 were able to migrate to neighboring Portugal.

Many Spanish Jews considered Portugal to be a peaceful and tolerant country because it had been a long time since any known persecutions had occurred against Portuguese Jews. The fleeing people offered King João II a large amount of money in exchange for safe passage and residence in Portugal. He was reluctant to allow them in because he was threatened by the enlargement of the existing influential

THE PLIGHT OF CONVERTS TO CHRISTIANITY IN THE IBERIAN PENINSULA

After the conquest of Granada in 1492, Fernando and Isabel consolidated their control of Spain through expulsion of Jewish and Islamic peoples. Edicts expelled Jews from Aragon and Castile in that year; the Portuguese followed with expulsion of Jews in 1496. The persecuted were allowed to stay if they converted to Catholicism. These converts were called *Conversos* (Converts) in Spain and *Cristãos-Novos* (New Christians) in Portugal. Iberian Muslims, or Moors, were included in these policies, although they were not formally expelled until 1610. Thereafter, they were called *Moriscos* in Spain and were lumped under the term “New Christian” in Portugal.

For centuries afterward, Iberian culture was laced with suspicion of and discrimination against the new Christians and their descendents. Applications for honors such as military knighthoods and other patents of nobility resulted in extensive background checks to ensure that the applicant was pure of blood, meaning that they contained no Jewish or Moorish ancestry. This prejudice was reinforced by the activity of the Inquisitions in both countries, as new Christians were suspected of secretly being Crypto-Jews (converts who secretly

Artist's depiction of the expulsion of Jews and Muslims from Spain in 1492. King Fernando and Queen Isabel of Spain are petitioned for mercy while a prelate holds a cross in front of them in warning. (Jupiterimages)

practiced Judaism) no matter how little of their ancestry actually contained Jewish or Muslim heritage. In Portugal, the Marquis of Pombal would finally remove the official distinction of “New Christian” from the law in 1772.

—Monique Vallance

Portuguese Jewish community; however, the lure of the money promised proved to be too great to resist. Instead, he allowed them in for the price of eight *cruzdaos* apiece, but they were only allowed residence for eight months. Most of those who did not leave in time were enslaved by the Crown, with the exception of some 600 families who were financially able to buy their permanent residence in Portugal.

Manuel I succeeded João in 1495 and began his reign by freeing all the Jews who had been subjected to captivity. However, politics soon superseded any clemency Manuel felt toward the Jewish population. He hoped to marry Isabel, the eldest daughter of Fernando and Isabel. Manuel hoped that marrying Isabel would result in a united Iberian Peninsula under Portuguese hegemony. However, Isabel and Fernando would not agree to a marriage as long as Jews were allowed to reside in Portugal. On December 5, 1496, the official edict was issued that decreed

that all Jews were to leave or convert by October 1497. Even though this act would be politically advantageous, Manuel knew that the expulsion of the Jews would be economically disastrous. He found an interesting way of satisfying both sides: forced conversions. According to the chronicles, those Jews who refused to convert gathered in Lisbon in September 1497. They expected to find ships to carry them to their new homes but were instead met with priests who intended to baptize them. Historians now believe that instead of one mass conversion, it is more likely that the conversions took place throughout 1497 all over the country. However it happened, by October 1497 the Portuguese Jewish population had technically been eradicated, even though most did not leave the country. It was replaced with a community of *Cristãos Novos* (New Christians), and Manuel promised them that no inquiries would be made into the sincerity of their conversion for 20 years.

► CRYPTO-MUSLIMS IN SPAIN

Much attention has been drawn to the Sephardic Jews and their continuation of practicing their religion after conversion, but less attention has been paid to the crypto-Muslims. Like the *Conversos*, the *Moriscos* were also closely watched by the Christian community in order to discern whether or not the converted Christians and their descendents were in fact truly faithful. Many of the practices of the former Muslims were contrary to the Christian culture; therefore, any adherence to former cultural practices automatically raised the suspicions of their Christian neighbors and often resulted in the Morisco being called to the Inquisition. For instance, it was customary for the Spanish Muslims to circumcise baby boys at the age of eight days. However, since the Christians did not customarily circumcise their babies, the continuation of this practice would draw suspicion. Therefore, most families waited until the child was eight years old before circumcising him. Even the act of washing one's body could be

cause for suspicion. This is shown in the case of a woman known only as "Madalena Morisca" in the Inquisition records from Seville, Madalena was called before the Inquisition in 1609 because two eyewitnesses claimed to have seen her bathing her body early in the morning in their common courtyard. They swore to having seen her bathe her face and thighs, and one account also mentioned that she had bathed her "shameful parts." To the Inquisition, this bathing represented more than a desire to be clean; it represented a desire to adhere to the Muslim religion and its ritual cleansings, often required before prayer. This case is symbolic of the dual lives that the Moriscos were forced to live. Even if they had truly given up Islam in favor of Christianity, any cultural practices and the Arabic language were identified with the banned religion, causing them to alter and hide many of the practices that had once been a part of daily life.

—Monique Vallance

King Manuel's successor, King João III, reversed Manuel's policies toward the new Christians. After a particularly strong earthquake in 1531, the Dominicans began preaching that God was angry at their tolerance of crypto-Jews. That same year João applied to Rome for the establishment of an Inquisition in Portugal, to be organized in a similar way to the Spanish Inquisition. The New Christians sent a lobbyist to Rome in order to block the approval of this institution but only delayed it, and it was finally approved in 1536. Many historians believe that this Inquisition was established for political rather than religious reasons. By persecuting the Jews and establishing laws barring them from receiving certain privileges and marrying into the noble families, the king was asserting royal power by ensuring the oppression of the New Christians.

The fate of the Muslims left in the Iberian Peninsula is surprisingly less dramatic than that of the Jews. The decree that expelled the Jews also included the expulsion of the Muslims. However, unlike the Jews, the Muslims were not obstructed from leaving and in fact were given permission to cross over into Castile. According

to the chronicles, the Muslims were offered this courtesy because they did not want to subject Christians living in Muslim territories to retaliation. In addition, the Muslim community was much smaller and less economically significant than the Jewish one; therefore, the Christian population was not threatened by them. In fact, the only reason they were probably expelled with the Jews was that Manuel wanted to show Fernando and Isabel that he was serious about Portugal being a Christian kingdom.

Around this time, the Spanish monarchs were sending missionaries into Granada in an effort to convert them to Christianity. Francisco Jimenez de Cisneros, the bishop of Toledo, was determined to acquire a great number of converts and ordered the burning of the Quran and other Muslim books. This caused a revolt in the city, and royal forces were called in to put it down. They used such force against the citizens that 50,000 Muslims converted to Christianity just to avoid more trouble. A new revolt caused Fernando and Isabel to publish an edict on February 11, 1502, that expelled all Muslims. Most converted in order to avoid losing their ancestral

lands, and these converts were known as Moriscos in the Spanish kingdoms.

Naval Strategy—*Guerre d’escadre and Guerre de course*

During the first era of global expansion, the terms *guerre d’escadre* and *guerre de course* meant competing naval strategies that were practiced during the age of sail. *Guerre d’escadre* referred to a strategy of controlling the sea through fleet-to-fleet encounters. It required a state to maintain large squadrons along with the requisite numbers of trained sailors and officers and the supporting infrastructure. *Guerre d’escadre* was very expensive and, as a policy, was beyond the capabilities of most European countries. In contrast, *guerre de course* referred to a policy of weakening or defeating an opponent by attacking its commercial shipping. *Guerre de course* was a traditional strategy of weaker states. Some of the benefits of the *guerre de course* included the use of smaller vessels and the commissioning of private shipowners to execute these plans. Letters of marque and reprisal were the legal documents permitting private shipowners to capture other vessels. Reprisal dated back to Roman law, under which individuals had a right to recover economic losses from attacks by foreign sailors. By the seventeenth century, this concept was expanded to allow governments to use private ships to harm the commerce of opponents and generate income. Theoretically, the system of letters of marque and reprisal that authorized privateering was closely regulated.

During the late seventeenth century and the eighteenth century, French authorities debated whether to wage *guerre d’escadre* or *guerre*

de course. Under Louis XIV, the French Navy had become the largest in the world. By 1677, it had 140 ships. When the War of the League of Augsburg broke out in 1688, the French Navy equaled the combined strength of the British and Dutch fleets and was able to support the deposed king of England, James II, in his efforts to gain Ireland. The French fleet won a victory over the combined allied fleets on July 10, 1689, at Beachy Head. The French failed to follow up on their naval victory, however. When the war required additional funds for the French Army, the French Navy was allowed to fall into disrepair. The allies gained control over the sea. Louis encouraged privateers, such as those based at Dunkirk, to attack allied merchant shipping. Letters of marque were issued to shipowners giving them legal permission to attack British or Dutch ships. Although allied commerce was greatly hampered by this strategy, it failed to break the allied control over the sea.

During the eighteenth century, French naval leaders were divided about which policy to follow. At times, they tried to build up a large fleet to challenge the British Royal Navy, but the costs of maintaining a large army did not allow them to match the British strength. The *guerre d’escadre* policy failed to bring them control over the sea. During other periods or after severe losses, the French would rely on a policy of attacking British merchant shipping. During the wars of the eighteenth century, the British lost thousands of merchant ships to French privateers. Captured ships would be taken to French or neutral ports. The ships and their cargo would be sold, providing supplies to the French and funds to the shipowners. This *guerre de course* failed to protect French merchant shipping, and the British were usually able to shut France off from overseas imports during times of war. The British also preyed upon French merchant shipping. Neutral merchant ships were stopped and inspected during this time to make certain they were not carrying contraband to France.

The French were only able to wage a successful *guerre d’escadre* once during the eighteenth century, thanks to exceptional circumstances. At the end of the Seven Years’ War in 1763, the British government downsized its navy. In contrast, the French Navy was expanded in hopes of

► ESTABLISHING RULES OF ENGAGEMENT IN THE RULE OF 1756

During the eighteenth century the French Navy generally avoided engaging the men-of-war of Britain's Royal Navy. Consequently, during the many imperial wars of the period, British warships targeted French merchant vessels, taking thousands of merchant ships and seamen and driving French shipping from the seas. To obtain imports from its colonies, the French turned to the ships of neutral powers. French Caribbean ports, loaded with sugar and coffee, opened their wharves to Dutch ships, yet the same ports were closed to non-French shipping during peacetime.

International law did not give the Royal Navy the authority to capture neutral shipping. During the Seven Years' War, British Admiralty courts, which decided if a captured ship, or prize, and its cargo could be sold, responded with the Rule of

1756. According to the rule, a neutral ship could not be given trade rights during war if those rights had not been given to it during peacetime. Such a ship violated its neutrality by giving aid to a belligerent nation. Royal Navy ships could therefore seize neutral ships carrying goods to and from enemy ports. The policy was naturally unpopular among neutral countries, and no other nation recognized the principle. Because the Royal Navy controlled the seas, no effective response could be made. By the mid-nineteenth century, however, diplomatic protests were having an effect. The British government chose not to apply the Rule of 1756 during the Crimean War and formally renounced it as policy in the 1856 Declaration of Paris.

—Timothy J. Watts

gaining revenge. When the American Revolution broke out in 1775, the French secretly began to support the Americans. On February 6, 1778, the French signed an alliance with the Americans and entered the war with Great Britain. French squadrons fought with equal or smaller British squadrons, thanks to the weakened British Navy. The most important naval battle was the Battle of the Chesapeake, fought in September 1781. Although the battle was a draw, the French forced the British squadron to return to New York without bringing reinforcements to Cornwallis at Yorktown. As a result, Cornwallis surrendered on October 19, ensuring an American victory.

Naval leaders continued to weigh the advantages of each type of warfare, considering the cost of maintaining large squadrons and trained sailors against the benefits of sea control. Both *guerre d'escadre* and *guerre de course* attracted adherents. The policy of *guerre de course*, however, became the rule for weaker naval powers. Privateering by private shipowners was outlawed by the Declaration of Paris in 1856, but *guerre de course* continued to be a viable policy into the twentieth century. During both World War I and World War II, German submarine warfare against allied shipping was a classic example of *guerre de course*.

Portuguese and Spanish Justifications for Conquest

The Age of Exploration was an age when more than land was discovered. To the surprise of the Spanish and Portuguese, they also discovered new peoples, with cultures and societies never before fathomed in the European imagination. The existence of these new people was a great shock to them, as neither the Bible nor any ancient texts actually described the natives

of the Americas. Therefore, the Spanish and Portuguese were in a new realm as they went through territory that was populated with new and exotic people. The people who lived in the Americas were both obstacles and facilitators to the settlement of the Americas. Ultimately the Europeans who arrived had justifications for the manner in which they came to possess and colonize the American continents. All of these directly coincided with their attitudes toward and perspective of the indigenous population.

One idea that was a major factor in the conquest of the Americas was the belief that the natives were “barbarians” or “savages.” The ancient Greeks used the term “barbarian” to refer to “outsiders” or “foreigners.” However, by the fourth century the term “barbarian” came to mean “culturally or mentally inferior.” This term was applied to people who were seen as living beyond what was deemed as “civilization” and often seen as less than human. This attitude was first applied by medieval Europeans to the people of the

THE TREATY OF TORDESILLAS

Portugal and Spain were steadfast rivals throughout the medieval and early modern periods. The major rivalry existed over land and territory, and that rivalry intensified as both kingdoms sent more and more explorers into the Atlantic. Throughout the fifteenth century, Portugal had been exploring down the western coast of Africa and setting up trading posts. Castile, ruled by Queen Isabel, commenced its explorations much later and began to encroach on African lands and trade already claimed by the Portuguese. As a result, Portuguese king João II negotiated a treaty with the Castilian queen in 1479. The Treaty of Alcáçovas stipulated that the Canary Islands belonged to Castile and that all territory south of the Canaries was under the sole dominion of Portugal.

In 1492 Christopher Columbus sailed west in an expedition financed by Queen Isabel and her husband King Fernando of Aragon. Columbus discovered the American continent but believed at the time that he had landed in India. On his return voyage to Castile, he made a stop in Portugal, probably to gloat because King João had denied Columbus’s application for the Crown to finance his expedition west. Upon informing the king that he had been to India, King João was quick to remind Columbus that the territory in fact belonged to Portugal because of the aforementioned treaty. King João began to organize a fleet of ships to claim the islands discovered by Columbus. In order to avoid war, Isabel looked to Pope Alexander VI, a Spaniard, to help settle the dispute. He hastily drafted a proclamation, or bull, full of geographical errors that drew a line on the meridian line passing 320 miles (100 leagues or 515 kilometers) west of the Azores Islands. Accord-

Pope Alexander VI establishes the Line of Demarcation to define the spheres of Spanish and Portuguese possessions in the New World in May 1493. Portuguese dissatisfaction with this arrangement led to the Treaty of Tordesillas in 1494. (MPI/Getty Images)

ingly, everything west of the line was allocated to Castile, and everything to the east was given to Portugal. The two kingdoms managed to negotiate a more accurate treaty in 1494, the Treaty of Tordesillas. This treaty was based on the pope’s earlier version but placed the line of demarcation at 1,184 miles (370 leagues or 1,905 kilometers) west of the Cape Verde Islands. The treaty prevented war between the two countries and, going through several diplomatic revisions, would last until 1750. However, it would not prevent Portugal from claiming Brazil for itself when Pedro Alvares Cabral discovered it in 1500. The Spanish would also claim the Moluccas in East Asia, actually on the Portuguese side of the line, and later sold them to the Portuguese.

—Monique Vallance

Canary Islands, the Guanches. The Portuguese king Duarte wrote to the pope in the 1430s in order to request that the Portuguese be allowed to complete the conquest of the Canaries, arguing that the people lived like “animals” in the forest. The Castilians were the ones who eventually completed the conquest, and the Guanches people went extinct. The arrival of Christopher Columbus in the Caribbean introduced Europeans to yet even more new people, who seemed even more “barbaric” than the Guanches had. The native people of Hispaniola wore little clothing, did not deal with money, and had an animistic religion, signs to Columbus that they were “savages.” A Papal Bull in 1493 allowed subsequent Spaniards to conquer the new territory, although it was meant for the purposes of converting them to Christianity. This image of the indigenous Americans persisted throughout the period of Spanish and Portuguese colonial expansion, even after the Spaniards encountered groups like the Aztecs that were sedentary and closer to what Europeans considered to be “civilized.” However, their practice of human sacrifice immediately demoted them to the level of the other natives. Their lack of humanity made it easy to justify Indian enslavement: if the “Indians” were no better than beasts, then there was nothing wrong with using them for labor against their will.

There were some who saw the natives as being human, but their lack of what Europeans considered “civilization” caused them to impose their civilization on the natives. This was done by organizing the indigenous people into village systems. In Portuguese America these village systems were known as *aldeias*, and in Spanish America they were known as missions. The purpose of these villages was to acclimate the natives to European culture as well as to introduce them to Christianity. In these villages the indigenous people were expected to assimilate to the European culture in dress, education, and religion. They were expected to work in exchange for the benefits that the Europeans saw themselves as providing, although the intended assimilation eventually became a miscegenation of the two cultures. By bringing civilization to the “primitive” natives, the Europeans saw themselves as the benefactors, bringing the benefits of their culture to people who, in their eyes,

did not know any better. Besides civilization, the saving of souls was one of the major justifications for conquering the indigenous peoples. According to Roman Catholic doctrine, baptism was necessary for entrance into heaven. Therefore, the missionaries who arrived in the jungles of South and Central America believed that they were bringing more than just civilization; they were bringing heaven as well. They believed that baptizing the natives and teaching them to read were beneficial to their eternal souls and justified whatever means necessary to meet that end. However, the maltreatment of the indigenous population did bother some, most famously Bartolomé de las Casas, a sixteenth-century Spanish Dominican who advocated with Charles V on behalf of the natives. Casas witnessed many of the abuses perpetrated by the Spaniards and fought ardently to end them. Other missionaries joined him, and they were successful in ending many of the practices that abused the natives.

In conclusion, the Spanish and Portuguese felt that they had the right to conquer the land and the peoples of the Americas because they were bringing civilization and Christianity. Since the Europeans were benefiting the lives of the natives (as they saw it), then the financial rewards they received were their just rewards. If the Spanish and Portuguese were doing God’s work, then they deserved their riches.

Christian Missions—Catholic and Protestant Approaches to Conversion

By far the dominant force in early modern Christian missions was the Roman Catholic Church. Catholicism’s advantages over Protestantism in global missions were numerous. The Catholic

European empires of Portugal, France, and particularly Spain dwarfed the Protestant empires of Britain and the Dutch Republic. In the religious orders, particularly the Jesuits and Franciscans, the Catholic Church possessed a dedicated body of men without family connections who could be ordered to the ends of the earth, while potential Protestant missionaries often feared for their ability to protect and support their wives and families in areas remote from Europe. The Catholic Church also commanded financial and organizational resources vastly superior to anything available to their Protestant rivals. There was no equivalent in any Protestant Church to the *Congregatio de Propaganda Fide* in Rome that supervised Catholic missionary efforts. Central control had its limits due to the slowness of communications in the early modern world, which often left missionaries stranded without word from their superiors in Rome for years but still enabled the maintenance of missionary efforts for decades and centuries.

Areas ripe for Christian conversion divided into two classes: those areas where Christian missionary efforts were backed by European military force and those where they were not. In areas such as the Spanish-American empire or the English colonies in America where Europeans faced indigenous peoples, native religions were forcibly suppressed, and sacred sites and objects were destroyed. The people were then “Christianized” through a program of preaching, confession (in Catholic areas), and translation of the Bible and other Christian texts. Much of our knowledge of early modern Native American languages comes from the dictionaries, grammars, and translations produced by Catholic and Protestant missionaries.

Areas such as China or the Iroquois Confederacy that maintained independence from Christian powers posed a different challenge. (Islamic powers prohibited Christian conversions entirely, and the missionary presence in the Islamic world was negligible.) One common route for Catholic missionaries into independent non-Christian societies was trade. Catholic missionaries entered China through the Portuguese base at Macao, Japan through the Nagasaki trade, and the Kingdom of Kongo through the slave trade. However, the greatest early modern Protestant

➤ CLEMENT XI ON THE CHINESE RITES

In 1704 Pope Clement XI (r. 1700–1721) came down on the side of the mendicant orders against the Jesuits on the question of whether Chinese Christian converts could continue to perform traditional Chinese rites, known as the Chinese rites controversy. The first article of his decree deals with language, and the pope orders converts to avoid traditional Chinese terms in talking about God. These terms were compromised by their long associations with traditional Chinese religion.

“I. The West calls Deus [God] the creator of Heaven, Earth, and everything in the universe. Since the word Deus does not sound right in the Chinese language, the Westerners in China and Chinese converts to Catholicism have used the term ‘Heavenly Lord’ for many years. From now on such terms as ‘Heaven’ and ‘Shangdi’ should not be used: Deus should be addressed as the Lord of Heaven, Earth, and everything in the universe. The tablet that bears the Chinese words ‘Reverence for Heaven’ should not be allowed to hang inside a Catholic church and should be immediately taken down if already there.”

Dun Jen Li, ed., *China in Transition, 1517–1911* (New York: Van Nostrand Reinhold, 1969), 23.

trading force, the Dutch empire, did not make use of trade to spread its brand of Christianity. Neither did England’s East India Company.

The basic differences in missionary approaches revolved around such issues as the best targets for conversion and the degree to which Christian converts were required to renounce their traditional culture. Generally the Jesuits focused on the social elite, hoping that if the people in the top layer of a society could be converted, their example and social power would move their societies to Christianity as a whole. Jesuit missionaries like Matteo Ricci in China or Robert Nobili in southern India adopted the manner and the culture of the elite to interest them in Christianity. This tactic was restricted to those cultures that Europeans considered civil, usually defined

as possessing cities, literacy, and a social hierarchy. Uncivil societies, such as those of the Native Americans, received much less respect from missionaries, and there was much less interest in adopting their ways as a conversion strategy.

The mendicant orders—the Franciscans and Dominicans—believed that following the example of the apostles meant that evangelizing the poor would reap the greatest harvest of souls. The Franciscans and Dominicans often charged the Jesuits with wanting the material comforts of the social elite and lacking true commitment to missionary work. There were fierce rivalries between Catholic religious orders over control of missions.

Another important issue was whether Christian conversion required a total change to a more European way of life. Generally Protestants took a harder line than Catholics, and the mendicants took a harder line than the Jesuits. Protestants insisted that Native American converts to Christianity adopt a more European-like lifestyle, as in the agricultural towns of Christian “Praying Indians” in New England. In China the Jesuit-identified strategy of accommodation allowed Christian converts to retain many traditional Chinese practices, such as veneration of Confucius and rites honoring ancestors, by defining these practices as civic rather than religious. This pitted the Jesuits against the mendicants in the Chinese rites controversy that was eventually settled in Rome in favor of the mendicants, dealing a devastating blow to the Jesuit mission in China. One large area of agreement among Christian missionaries, however, was the importance of enforcing Christian sexual morality on converts. Polygamy, concubinage, and the acceptance of homosexuality and cross-gender behavior were frequent targets of evangelists.

The Pueblo Revolts in New Mexico, 1680

The first Spanish explorers passed through what became New Mexico in the early 1530s. Stories

of wealthy Indian cities spurred other expeditions, especially the Coronado expedition of 1540. Coronado’s failure to find riches caused Spanish authorities to leave the area alone for another 50 years. In 1598 around 400 colonists made their way to the Rio Grande Valley and established several settlements. The most important was the capital of Santa Fe. Franciscan priests established missions in the Pueblo towns throughout the region.

The Pueblos, taught to cooperate, put up little resistance to the Spanish incursion. Spanish demands for tribute and forced labor caused unrest, but the forced conversion to Christianity was the greatest cause of dissent. The Franciscans viewed the native religion, with its kachina gods, as evil. They tried to destroy all sacred objects and sites and prevent its practice. They called on the secular authorities to help them prevent the Pueblos from practicing their religion. Some authorities enthusiastically backed the Franciscans, but others disliked their claim of authority. Although some Pueblos were punished over the years, by the 1660s followers of the old religion were increasing.

Among the reasons for the increased following were environmental disasters and the spread of European diseases. Years of drought brought famine and reduced resistance to European diseases. Smallpox devastated the Pueblo Indians during the 1640s and again in the 1660s. The decline in living conditions discredited the Franciscans’ promise that Christianity would bring spiritual salvation and earthly advantages. Raids by Apaches also made it clear that the Spanish would provide little protection to the Pueblos.

Those who practiced the traditional religion were punished by the civil authorities. In the 1670s Governor Juan Francisco de Trevino energetically sided with the Franciscans against the Pueblos. In 1675 he had 47 leaders arrested for their religious practices. Four died, and the others were whipped. Among them was a native priest from Tewa named Popé. He moved to Taos and began to organize a revolt against the Spanish. Popé was able to unite the Pueblo towns to force the Spanish out. When Governor Antonio de Otermin learned of the plot, the Pueblos acted quickly. On August 10, 1680,

► TESTIMONY OF DON PEDRO NANBOA, 1680

Don Pedro Nanboa was a Native American from the Pueblo of Alameda who was captured by the Spanish during their retreat from Santa Fe on September 6, 1680. His testimony before Governor Antonio de Otermin about why the Native Americans had risen in revolt against Spanish rule offers rich insight into puebloan life under Spanish rule.

Nanboa was a widower and more than 80 years old at the time of the revolts, too old to participate in the fighting. But he supported the uprisings, and his testimony confirmed Spanish suspicions about the reasons for the Pueblo revolts. Nanboa revealed that the rebellion had been plotted for at least 12 years and that the Pueblos hoped to drive the Spanish from their lands and to restore their society to its original state. His people were

most angry about the Franciscan missionaries' efforts to eradicate traditional Puebloan religious practices. Since his boyhood, Nanboa complained, his people had had to meet secretly to practice their faith and to pass along their traditions. They also resented the work they were forced to do for the Franciscan missions and Spanish authorities without consideration of the Pueblos' needs.

Nanboa's testimony and similar testimony from other Pueblos influenced Spanish policy after reconquering New Mexico. In particular, the civil authorities were much more willing to allow the Pueblos to keep their traditions and to have more autonomy in order to preserve the peace.

—Timothy J. Watts

Pueblos all over the Rio Grande Valley rose up. Out of nearly 2,500 Spanish settlers, soldiers, and missionaries, they killed 380 settlers and 21 of the 32 Franciscans. Most of the survivors fled to Santa Fe. The Pueblos cut off the town's water supply, forcing Otermin and more than 1,000 refugees to flee for El Paso. The Pueblos allowed them to leave, wanting them out of the region more than to kill them.

When the Spanish fled, the Pueblos destroyed the churches and much of what the Spanish had built. Thousands of horses were released into the wild from the Spanish ranches. Other Native Americans heard of the revolt and rose up as well. The Pueblo Revolt was the only successful uprising against Spanish authority in North America.

After Popé died, the Pueblos fell back into a traditional pattern of cooperation. Beginning in 1692, Diego de Vargas led an expedition that began to reconquer the region. When the conquest was completed in 1696, however, civil authorities did not allow the Franciscans to reassert their authority. Instead, they recognized that the Pueblos had been driven to revolt by the threat to their native religion. The authorities allowed the Pueblos to practice their rituals and a greater degree of local authority.

Slave Revolts in British North America—Virginia, New York, and South Carolina

Slavery was common to all of the British North American colonies, and so was slave resistance. However, outright rebellions were few. White slave-owning society was vigilant, and given the difficulty of slave movement and the difficulty of keeping secrets, rebellions were usually suppressed before they could even emerge. Differences among the many African languages that slaves spoke and low literacy also made it difficult for slaves to plan rebellions together. Rebellions often involved a core group of slaves from the same African ethnic or linguistic group. As well as communication, bonds of trust were also

THE SENTENCING OF JOHN AND SARAH HUGHSON

In sentencing tavern keepers John and Sarah Hughson to death for their participation in the New York Conspiracy, the court made clear the racial nature of their offense and the danger of whites and blacks associating:

"I cannot say the punishment is adequate to the horrid crimes of which you stand convicted. . . . [Y]ours are indeed as singular, and unheard of before, they are such as one would scarce believe any man capable of committing, especially any one who had heard of God and a future state; for people who have been brought up and always lived in a Christian country, and also called themselves Christians, to be guilty not only of making negro slaves their equals, but even their superiors, by waiting upon, keeping with, and entertaining them with meat, drink and lodging, and what is much more amazing, to plot, conspire, consult, abet and encourage these black seed of Cain, to burn this city, and to kill and destroy us all."

—William E. Burns

Daniel Horsmanden, *The New York Conspiracy* (Boston: Beacon, 1971), 140–141.

greater in ethnically homogenous groups. However, slave rebellions also saw alliances between African and Native American slaves, free blacks, and marginalized elements of the white population, such as indentured servants, criminals, or the urban poor.

One of the earliest efforts at a large-scale rebellion involved slaves and white indentured servants in Gloucester County, Virginia, in 1663. Some of the indentured servants may have been Parliamentary soldiers from the English Civil War. The plot was betrayed by an indentured servant before the rebellion could actually begin. Conspiracies in the Northern Neck area were detected and suppressed in 1687 and 1688, and Virginia authorities continued to detect and suppress alleged slave conspiracies into the eighteenth century. The announcement that a slave conspiracy had been suppressed was often accompanied by trials and executions of

the alleged ringleaders and harsher measures against slaves and free African Americans.

The largest slave rebellion in British American history was the South Carolina Stono Rebellion of 1739. South Carolina's black majority society was more similar to that of the British Caribbean, from which many of its original settlers had come, than to that of other mainland colonies. About 20 slaves of Kongo origin led by a man referred to as "Jemmy" or "Cato" hoped to make their way to the Spanish colony of Florida. Spain was at war with Britain, and Spanish authorities in St. Augustine had proclaimed that escaped slaves from British colonies would be accepted as free. Another factor influencing the timing of the revolt's outbreak may have been the recent passage of the South Carolina Security Act, which would have required white men going to church on Sunday to carry firearms. The law was scheduled to go into effect on September 29, and the rebellion broke out on a Sunday, September 9.

The Kongo slaves first gathered near the Stono River in the early morning. They armed themselves by breaking into a shop selling firearms, killing 2 white storekeepers. The slaves went on to kill between 20 and 25 whites, although at least 1 white slave owner with a reputation for treating his slaves well was spared. Other slaves joined the rebellion, although many of them, lacking the military training of the Kongo slaves, may have been more of a burden than an asset to the rebels. Descriptions of the slave army indicate many features of African military organization, such as the use of drumming, dancing, and banners identifying units. The rebellion ended late in the afternoon in a large field near the Edisto River, where the slaves had stopped to rest. They were attacked by a large force of local whites, who killed many and forced the rest to flee. All were eventually captured. The Stono rebels received no trial, as panicked whites simply killed captured rebels or sent those judged less dangerous back to their owners. It is likely that Cato, if captured rather than shot in battle, was simply killed out of hand as a dangerous rebel. The rebellion was followed by the Negro Act of 1740, a revision to South Carolina's already very harsh slave code setting up strict controls on slave assembly and movement.

Cities, where slaves of different owners could more easily mingle and also deal with possibly sympathetic whites and free African Americans, were common areas of slave unrest and rebellion. New York City, which had a larger slave population than other northern cities, was particularly marked by slave revolts. There was a large revolt of 25 Coromantee slaves from the Gold Coast area of Africa on April 1, 1712. The slaves burned buildings on the edge of town and attacked whites who came to put out the fires, killing or wounding about 20 whites. The slaves fled to the area north of the city but were captured the next day. Under the harsh slave code, the slaves were judged guilty of “petty treason,” and 18 were executed. Their heads were displayed on pikes in the city to discourage further revolts. A new slave law, passed after the rebellion, set more restrictions on relations between free blacks and slaves and forbade free blacks from owning houses or land in the city.

In 1741 New York authorities claimed to have detected a large plot involving slaves, free African Americans, white criminals, and possibly Spanish agents. The fear of a slave conspiracy merged with the old English Protestant fear of a Catholic conspiracy and with property owners’ fear of crime in a high-crime city. Slaves and their accomplices were charged with arson—always a terrifying crime in an early modern city,

much of which was built of wood—and planning to slaughter New York’s citizens. The trials were the most elaborate and best-documented of any colonial slave revolt, thanks to the efforts of the city’s recorder, the barrister Daniel Horsmanden, author of *A Journal of the Proceedings in the Detection of the Conspiracy Formed by Some White People, in Conjunction with Negro and Other Slaves, for Burning the City of New-York in America, and Murdering the Inhabitants*. One hundred fourteen slaves were either convicted or confessed, and 31 were executed, some by hanging and others by burning. A white couple, John and Sara Hughson, who owned a tavern where slaves and their allies had allegedly plotted the rebellion, was also hanged. The main trial was followed by the trial of a white Catholic priest, John Ury. Despite very flimsy evidence of any connection to the conspiracy, Ury was also convicted and executed.

■ Introduction: Diplomacy and Diplomats

The origins of modern diplomatic traditions can be traced to Renaissance Italy, where national security came to depend on the speed and accuracy of information that each Italian city-state had on its neighbor. Medieval diplomacy was mainly conducted by nuncii, procuratores, or legati who formally delivered news or negotiated on behalf of their principal. These envoys were usually dispatched to resolve some particular matter (negotiate a trade treaty, establish an alliance, betroth a princess, etc.), and once the mission was accomplished they returned

home. Such an embassy was an honorable appointment and was headed by a prominent noble or citizen, often a member of the prince’s own family. There was limited diplomatic continuity.

However, by the late fifteenth century international affairs and diplomacy became a rather complex undertaking that required a more permanent system of intrastate communications. Through the maze of intrigue and the efforts to cajole, browbeat, and deceive each other, the Italian city-states—most notably Milan, Florence, and Venice—began a practice of establishing

permanent embassies, giving us the word “diplomacy” itself, from the “diplomas” or letters of credence that these resident envoys presented to the sovereign to whom they were accredited. These new permanent envoys could be selected from a wide field of obedient and skillful officials instead of prominent members of the courts who might be anything but capable or trustworthy. This, however, did not mean complete rejection of the dignified embassies of earlier times but instead meant using them as ceremonial exchanges to emphasize the importance of a given occasion. Continuous representation in a given country produced greater familiarity with conditions and personalities that shaped local politics and events and thus allowed for a more effective diplomacy. Aside from continuity, another key element in the emerging resident diplomacy was secrecy. The arrival of a temporary embassy was a public event, and its dealings were closely followed. On the other hand, permanent representation allowed envoys to conduct their negotiations informally, oftentimes behind the curtains, before making public announcements. This was an important element in relations between the states, since a successful negotiation by definition implied that each side had to settle for less than it desired. The secret nature of such talks allowed these states to maintain their reputation and the respect of other states as well as to prevent hostile factions or groups from sabotaging the talks.

In the fifteenth century and for some time later, foreign envoys were regarded not only as useful channels of communication but also as dangerous men, even spies, intriguing with the ruler’s domestic enemies. The turbulent relationship between Queen Elizabeth of England and the Spanish envoys in the last sixteenth century is just one example of this trend. Nevertheless, by the mid-seventeenth century permanent missions representing one country in another became the customary and normal way of conducting international business among sovereign states because they proved indispensable to rulers caught up in the pressures of power politics. European monarchs recognized the immunity of ambassadors and their staff from civil and criminal proceedings and the inviolability of their

embassy premises and their exemption from customs duties and from taxes. The seventeenth and eighteenth centuries saw the increasing professionalization of diplomacy. Prospective candidates received proper training to possess relevant knowledge and technical expertise to conduct their business. Routine communications were conducted as a rule in the vernacular language (often using numerical ciphers), while treaties or other important documents were written in Latin. The states established first archives as depositories of documents so as to ensure diplomatic continuity and maintain histories of political, commercial, or other negotiations. Ambassadors’ lengthy dispatches usually contained important political, military, and economic information; pen portraits of prominent people; and rumors and whispers overheard at the court. One of the best examples of a skilled resident envoy is that of the French ambassador François de Callières. Callières’s book *De la Manière de Négocier avec les Souverains* (1716) served as a textbook for many European diplomats, informing them on diplomatic behavior, polite conversation, and the gathering of information at a foreign court. The negotiator at foreign courts, Callières advised, must have a gift for languages, cultivate a sympathetic charm, and learn courtly manners so he could entertain well and make careful use of flattery and bribery. Different missions required different skills, but the diplomat should always avoid fraud and deception, which impair the confidence of sovereigns and their ministers. Callières’s book was preceded by Don Juan Antonio de Vera y Figueroa’s influential *El Embaxador* (The Ambassador, 1620), which also stressed the necessity of education as a prerequisite for the perfect ambassador. Furthermore, de Vera believed that mastery of theology and languages was not enough and that the successful envoy must have a wide knowledge of all branches of secular knowledge, including philosophy, mathematics, astronomy, music, and law. The ambassador must be an example of moral virtues in public service and must be a loyal, brave, temperate, and prudent servant of his sovereign.

The Renaissance era saw further elaboration of the rules of diplomacy. Ranking of diplomatic

agents was introduced, and fifteenth-century diplomacy saw the transition from medieval figures of diplomatic representation to those of the ambassador and envoy. The arrival and treatment of these diplomats were regulated by a protocol, procedural rules of diplomacy that entailed a rather elaborate ceremonial to burnish a prince's status and reputation and solemnize agreements. The development of protocol was of great importance, as it made the need for diplomats to continuously argue about procedure and precedence each time they met unnecessary. The diplomatic precedence—the order in which diplomats arrived, were received, and seated or appended their signatures to documents—was of particular significance since it symbolized the status and prestige of the country represented by the diplomats. Thus, in 1504 in an attempt to end bitter quarrels between ambassadors, Pope Julius II set forth an order of precedence, placing himself (unsurprisingly) first among the monarchs. The Holy Roman emperor came second followed by the kings of France, Spain, Aragon, Portugal, and Britain; the king of Denmark was at the fourteenth (and last) place. However, this diplomatic hierarchy caused new difficulties in the wake of the Reformation, when many kings and princes left the Catholic Church. Furthermore, the Spanish ambassadors refused to accept the pope's classification that placed them below the French envoys. The French and Spanish ambassadors became notorious for their rivalries and shoving and pushing. In September 1661 when the Spanish ambassador's coach tried to cut in front of the French ambassador at a procession in London, a bitter hand-to-hand battle erupted in the street, leading to a fissure in Franco-Spanish relations. Such diplomatic quarrels continued until the Congress of Vienna laid down specific rules on diplomatic hierarchy in 1815.

Throughout the fifteenth to eighteenth centuries the majority of states around the world were monarchies, and government affairs and diplomacy were thus conducted almost entirely at the ruler's discretion in accordance with his personal interest or worldview rather than some national considerations. Until the eighteenth century, responsibility for diplomacy was routinely divided among different bureaucracies, but a

central foreign affairs body gradually emerged in some European states. The establishment of a ministry of foreign affairs, as these bodies became known, was necessitated by the need to coordinate the state's foreign policies; to recruit, dispatch, finance, and maintain regular and secure diplomatic relations with permanent embassies abroad; and to manage foreign embassies in its own capital. France was the first European state to establish a ministry of foreign affairs. On January 1, 1589, the royal decree charged one of the state secretaries, Louis de Revol, with exclusive responsibility for foreign affairs and created a staff to assist him in his duties. Cardinal Richelieu established the Secretariat of State, a formal body in charge of foreign affairs, in 1626. In contrast, Britain's Foreign Office was established in 1782, and the U.S. State Department was established in 1789. It was the middle of the nineteenth century before Asian and African states followed suit.

Diplomacy is interwoven with international law that seeks to regulate relations between states and between other organized groups and individuals on the international scene. The international law as we now know it can be traced to the writings of Hugo Grotius, the Dutch jurist and diplomat who in the seventeenth century formulated it in his famous *De Jure Belli ac Pacis* (The Laws of War and Peace, 1625). In this book Grotius first examined the existing patterns of relations and behavior by European states and placed them in the context of international practices and Judeo-Christian tradition. He then suggested where these practices might be modified to make them more rational and more conducive to peace. For Grotius, diplomacy and international law were the means of achieving "the harmony of the world." Indeed, from Grotius's day to the present day, one of the major tasks of diplomacy has been to establish the rules of engagement and maintain peaceful relations in the international arena. Interestingly, these rules that European scholars like Grotius formulated based on peculiar European experiences as well as aspirations drawn from Christianity expanded far beyond their original scope of western Europe and, through European colonialism, came to encompass the whole world.

Political Embassies in Early Modern India

In the early seventeenth century, Europe, in spite after decades of war, began reaching out to Asia in search of trade and wealth. This eventually led to a struggle for trade supremacy in the lavish array of goods that Europeans discovered in India. They had little understanding of whom to petition for trading rights or indeed where power resided. India, encompassing a rapidly expanding Mughal empire, regional kingdoms, and princely states with diverse beliefs and languages, was an enigma for European merchants. While shrewd traders made business arrangements with small states and sultanates on the coast, the Mughal emperor Akbar had been waging war on such small independent polities, consolidating his power until his dominion reached from the Arabian Sea to the Bay of Bengal and north across the mountains to Kabul. Thus, Europeans had to adapt to the region and circumstances of the time.

The Portuguese, who had reached India even before the Mughals, were first to have an embassy at the Imperial Court in Agra and to establish a strong naval presence in the Arabian Sea. By force of arms rather than diplomacy, they then set up a string of important coastal bases from Diu, in Gujarat, south as far as the island of Ceylon.

In 1612 a small English fleet triumphed over the Portuguese at the Battle of Swally off the coast of Gujarat. However, warfare was effectively cutting into profit from regional trade. The English needed their own royal ambassador at the Mughal court to represent their commercial interests and allow them to establish a permanent foothold in India. For this they required a *firman*, or royal patent, from the emperor giving them exclusive rights to reside and build factories and fortifications in Surat and other places. In return, the English East India Company was prepared to provide the emperor with goods and luxuries from European markets and pay Mughal import and export duties of 3.5 percent or, in the case of gold and silver, 2 percent.

The practice of maintaining interstate relations was in its infancy in India. Unlike

Europeans, the Mughals accredited ambassadors themselves only for specific missions, and bilateral diplomacy was a rarity reserved for countries perceived to be of equal rank, such as Safavid Persia. European countries were not as influential or significant to the Mughals. Emperor Jahangir's extensive memoirs rarely mention the English (or any other Europeans for that matter). His descriptions of them were only in reference to a major gift such as a carriage or when their navy defeated a Portuguese fleet. He wrote at greater length about a turkey. England, a small island far away with no army to speak of, mattered little in his view. At this time, European nations posed no danger to the great Mughal empire. Thus, an order sent to London by the East India Company agent in 1614 illustrates just how much English officials tried to impress the Mughals:

Maccrab Khan desires various things to be dispatched on the next ship to Surat for the Great Mughal: Two complete suits of armour, strong yet light. Curved swords, Knives of best quality. Satin and Velvet, red, yellow, green and tawny. All kinds of toys to keep the king happy, and women's toys. The largest mirrors[,] . . . mastiffs, greyhounds, spaniels.

Sir Thomas Roe, an English aristocrat and experienced diplomat, was appointed King James I's ambassador to Agra in 1613 and succeeded in extracting trading concessions from Emperor Jahangir. However, the Portuguese constantly gave more ostentatious gifts to upstage the English. Roe raged against this imperial baksheesh by stating that "such is the faithlessness of their people, that no trust, no confidence, is to be had in them—what they grant to-day shall be revoked tomorrow."

The Mughals, with their processions featuring richly caparisoned elephants to display their wealth and power, ruled northern India and were expanding southward to increase their territory and extract resources. Here they came across the Dutch.

The Dutch, though superb commercial strategists, had achieved independence from Spain

► HOW DANISH MERCHANTS BUILT ON DUTCH SUCCESS

In 1620 the Danish king appointed Admiral Ove Gjedde as ambassador to the king of Tanjore (in peninsular India), whose eastern frontier was the Coromandel Coast. To assist him in opening relations in the region, Gjedde brought along a Dutch captain, Roeland Crape, who had honed his diplomatic skills during the two years he had been resident in Tanjore. Crape's negotiations with the king proved quite fruitful. Gjedde was quickly summoned on the understanding that first he meet a Brahmin high priest. Ignorant of court protocol, he refused. As a consequence, King Raghunatha made him wait two days and insisted that he visit the priest before diplomatic relations could begin. Even so, after two weeks of talks the king still denied Gjedde what he wanted most, exclusive trading rights for Denmark and

the banishment of the Portuguese, with whom there had been some trouble. At this point Portuguese merchants were still well established in the region, paying substantial revenues. Gjedde would attain trading rights only on the condition that the Danes and Portuguese have amicable relations. Gjedde accepted. A treaty was concluded granting Denmark the same terms as those given to the Portuguese. They were provided with their own port and fortification on the Coromandel Coast as well as the right to practice their own religion.

The Danes retained peaceful and prosperous relations with Tanjore until 1755, when they moved farther north to trade near the mouth of the Hooghly River in Bengal.

—Hugh Purcell

only in 1581 and struggled to achieve diplomatic recognition in the early years. They too set up an East India Company, Vereenigde Oostindische Compagnie, with a view to dislodging the long-established Portuguese through informal diplomacy, forging friendly alliances with local rulers. The most significant of these was an offensive and defensive treaty made in southern India with the *zamorin* (king) of Calicut in 1604. Even so, it was to be more than 50 years and some fierce fighting before Dutch forces drove the Portuguese out of Malabar and Ceylon.

The French were late in the pursuit of South Asian trade, establishing their first factories in western India in 1668–1669 and then in 1673 transforming a fishing village on the Bay of Bengal into the thriving seaport of Pondichery. Like other Europeans before them, they set out to win trading allies among petty rulers, but they soon came up against Dutch and British commercial interests. By the 1740s there was heated competition between the French and the English, each making strategic alliances with ambitious rival polities. Then in 1744 news reached India that war had broken out between France and England. By the time a peace had been signed in Europe, there was open warfare between the two in India, culminating in the Battle of Plassey, the loss

to the French of Hyderabad, and the razing of Pondichery to the ground. In 1769 La Compagnie Française des Indes Orientales became insolvent.

Laihua Diplomacy under Ming-Qing Rule

Chinese foreign relations in the later imperial period, especially under the Ming (1368–1644) and Qing (1644–1911), were governed by the principles of *laibua* diplomacy, which meant the Confucian goal of transforming foreign peoples by their assimilation of Chinese cultural values and customs. Barbaric ways (*wu*) would give way to superior Chinese *wen* (cultivated gentility). Needless to say, such a policy and attitude often led to the Chinese being seen as arrogant,

➤ “YOU ARE FREE TO COME AND BE TRANSFORMED”

“You are free to come to be transformed” is a free translation of the term *laihua*. Literally, *lai* means “to come,” and *hua* means “to be transformed.”

—Yi Li

ethnocentric, and stubborn in their interactions with other peoples.

Laihua diplomacy was rooted in the Chinese perception of the world order. The Chinese have long referred to their country as *Zhongguo*, or the Middle Kingdom. From this perspective the world is concentric with China in the center, geographically as well as culturally; the Chinese influence would then radiate out from the center to transform those on the margins by enlightening them with reason, spraying them with imperial grace, and shocking them into submission with power. While such a perception was not uncommon in ancient times among a wide variety of peoples, the Chinese seem to have held it more strongly than most, making it the principle behind their characteristic tribute system of diplomacy. In addition, the Chinese idea of *laihua* was different from other ethnocentric perspectives in that the ultimate goal of *laihua* was to absorb all outside “barbarians” into the “civilized” world of China. Regardless of one’s birth, having adopted the Chinese “civilized” ways would make one a Chinese; having dropped such ways, on the other hand, would cause one to lose one’s Chinese-ness. Therefore, in the Chinese mindset the difference between themselves and others was cultural rather than biological.

The peculiarities of China’s historical interaction with its neighbors, especially the steppe nomads, over its long history had hardened the myth of *laihua*. Unlike the Chinese, many of the peoples on China’s periphery did not always have, at least in Chinese eyes, stable governments, writing systems, and the same kind of elaborate explanations of human society and nature. While military conflicts between China and many of these peoples at times ended in China’s humiliating defeats, the triumphant

“barbarians,” after taking over Chinese land, often adopted China’s more developed culture. This appears to have been a recurring story of the Tuoba, Qidans (Khitans), Ruzhen (Jurchen), Mongols, and Manchus. All of these peoples had at one time or another conquered part or all of China, but all had adopted the Chinese culture to various degrees. Undoubtedly such experiences had reinforced the idea of *laihua*, no matter how misleading it was. The official language issued by the governments in China was often flavored with rhetoric that would leave the impression that *laihua* diplomacy was indeed a reality.

Beginning in the sixteenth century, the first Europeans arrived on the Chinese coast, most of whom were merchants. Chinese authorities, drawing upon an ideology and diplomatic practices that were already many centuries old, regarded them as coming to pay tribute. The European merchants, who were hungry only for profits and handicapped by a language barrier, often opted not to disabuse the Chinese of this idea. The result was that the Europeans conducted their business, while the Chinese officials saw and had confirmed in their mind one more example of *laihua*: peoples from afar coming to be transformed by Chinese culture. Beginning in the eighteenth century, however, new players came to China. The new players were the rising powers of Britain and France, which grew increasingly self-confident as they surfed the high tide of their scientific and economic revolutions. Their egos were hurt deeply when the Chinese, following age-old precedents, received and regarded their arrivals as *laihua*. As a result, their accounts of how the Chinese treated them, although not without grounds, often contained exaggerations as a catharsis for their frustrations. The term “*laihua* diplomacy” thus entered into the Western vocabulary and became a Western trope or cliché, an example of and shorthand for perceived Chinese arrogance, backward-looking isolationism, and blindness. Toward and in the nineteenth century, *laihua* diplomacy provided a convenient Western explanation for China’s perceived misfortunes, especially after the Opium Wars, and the widespread belief that China’s arrogance was beyond changing.

However, the Chinese diplomacy during this period did not always fit well with this Western myth, for there was always a difference between the government's rhetoric and reality. Chinese merchants had long explored the worlds beyond, for example, particularly since the tenth century, and their thriving community in Calicut was well noted by the fourteenth-century Muslim traveler Ibn Batutta. Another example that complicated the myth of laihua diplomacy was the experience of the Jesuits in China. The Jesuits first arrived in China in the late sixteenth century, a time when the Ming ruling house was faced with multiple problems. The Jesuits' mission to China was evangelical; conflicts between the Christian and Confucian cultures were therefore inevitable. Indeed, some Jesuits were constantly rejected, and Francisco Xavier died at the gate of China. But many others managed to succeed as they sweetened the gospel with Western science and technology. The Chinese were particularly interested in Western astronomy, and many Chinese high officials, noticeably Guo Shoujing and Xu Guangqi, put their minds and hearts into the study of it. In their two-century-long stay in China, many of these Jesuits, like Matteo Ricci, enjoyed a fine reputation and were well received by their Chinese hosts. Some of the Qing rulers, although coming to rule over China from a seminomadic background, were also greatly interested in Western learning. Emperor Kangxi (r. 1662–1722) had a crew of Jesuits serving as his advisers, and from them the emperor learned about the West.

Chinese interest in and efforts to learn about the West paid off in the execution of their diplomacy. In the late seventeenth century, the eastward expansion of the Russians reached the eastern edge of Siberia to the Amur River Basin, the home base of the Manchus, and led to clashes with the Qing Chinese. Limited warfare ensued followed by negotiations mediated by the Jesuits who happened to serve the Qing court. In 1689 Qing China and tsarist Russia concluded the Treaty of Nerchinsk, a treaty formulated according to Western-style equal-footing diplomacy and that defined the international border between the two sovereign countries. The treaty remained in effect for more than 100 years until

the mid-nineteenth century, when the Russians changed the terms in the treaty, taking advantage of the so-called midcentury crisis that the Qing dynasty was going through. The Chinese not only worked with the Russians but also worked with other Westerners. On the eve of the First Opium War (1839–1842), the Chinese navy conducted a joint venture with the British to wipe out pirates along the Chinese coast. Although the venture was less than successful, it was an anomaly that the Western model of laihua diplomacy failed to explain.

The Puzzle House of the East— Jesuit Diplomacy under Matteo Ricci

Between the sixteenth and eighteenth centuries, the Jesuits emerged to be one of the most active agents in Eurasian diplomacy. Asia and Europe were never strangers to each other, but now the interactions between them became much more of a reality thanks to the activities of the Jesuits in East Asia, particularly in Japan and China. The Jesuits were instrumental in the making of a unique episode in the relations between the East and West at that time.

The Jesuit diplomacy took place against a background characterized with the rapid rise of European influence in the world. In 1511 the Portuguese took over the control of Malacca from the Arabs and subsequently gained direct access from the Indian Ocean to the China Seas. The Portuguese first arrived at China in 1514 and then in 1543 landed on the small island of Tanegashima in Japan. In 1557 they established a post at Macao, which served as a base for their

continuous ventures in East Asia. Other Europeans quickly followed suit: the Spanish came in 1592, and the Dutch came in 1600.

Riding on the rising tide of European presence in East Asia, the Jesuits began reaching out for the region in their evangelical work. The first Jesuit who ever set foot on the East Asian land was Francis Xavier (1506–1552), a Portuguese Jesuit who came to Japan in 1549. While Xavier's goal was to spread the gospel to the people in Japan, his Japanese host had a different idea in mind. At that time Japanese society was going through a period known as *sengoku*, or the warring states, with about 300 or so local lords fighting incessant battles over the control of the lands. Trade with the Europeans meant not only profits but also opportunities to import firearms. Assuming that Xavier's presence would bring in more money and guns, some local lords granted him permission to preach, and he thus founded the first Christian church in Japan. Xavier's initial effort was continued by other Jesuits who subsequently arrived and ushered in a period of Christian era in Japan, with 150,000 Japanese converted to Christianity.

Xavier's experience in Japan also set in motion the successful working of early Christian evangelism in East Asia. Prior to this time East Asia had only sparse contacts with Europe, and the main components in its cultures were, by and large, Daoism, Buddhism, Confucianism, and many local sects of shamanism. Many concepts of Christianity were extremely unfamiliar, if not antagonistic, for most East Asians. For example, the idea of the Virgin Mary giving birth to Jesus would go sharply against the family-centered social fiber in China, and the monotheistic worship of God was at odds with the worship of many gods in various Shaman practices. Strong resistance to the Jesuits' evangelism was therefore inevitable. By sweetening the Christian messages with fruits of Western material culture, however, the Jesuits were able to soften and then eliminate the built-in resistance. The blending of Christian evangelism with the Western material culture thus became a unique feature of the so-called Jesuit diplomacy.

The most successful in the Jesuit diplomacy were undoubtedly two Jesuits from Italy, Alessandro Valignano, who came to China in 1577,

and Matteo Ricci, who followed in 1583. Ricci was a central figure in the so-called Jesuit mission to Asia. Originally from Italy, he arrived in Macao, then a Portuguese enclave on China's coast, in 1582, and from there he entered and lived in China for the next three decades. During this period Ricci traveled around the country, studied the local culture, and mastered the Chinese language. His understanding of the Chinese culture paved the way for him to enter the inner circle of the Chinese elite. Christian evangelism in China was characterized by a skillful manipulation of the Chinese language to accommodate the biblical messages, sweetened by the modern science and technology developed in the West. Ricci gained great success in his mission, with many of the elite of China converting to Christianity.

Taking a lesson from the previous experience, these Jesuits charted a new course of action in China: they replaced Europeanism with cultural adaptation and brought Christianity into Chinese high society quietly to transform it from within. The Jesuit missionaries in China were instructed to learn to read, write, and speak Chinese so that they could see from the Chinese perspective rather than forcing the Chinese to see from the European perspective. With their knowledge of the Chinese language and culture, they introduced Western scientific and technological innovations to the Chinese. Their astronomical, mathematical, geographical, and other scientific achievements allowed them to make friends of many more open-minded Chinese scholars and officials, including some high officials such as Li Zhicao, director of the Board of Public Works, and Xu Guangqi, a member of the Hanlin Academy.

While the Jesuits carried out their evangelical mission in full integrity, they were also careful with the method by which to present the gospel. Since there is no equivalent to the term "God" in the existent Chinese language, for example, the Jesuits chose the closest term, *Tian* ("heaven"), to convey the Christian concept. While *Tian* carries the idea of transcendence in Chinese, it may not exactly translate the concept of an omnipotent creator in Christianity. The Jesuits knew that well, but they believed that the borrowing of the native concept would provide

a shortcut for delivering Christianity to the Chinese. In fact, such a strategy helped the Jesuits avoid many unnecessary clashes between the Chinese and Western cultures. While the Japanese warlords were taking the baits of commercial profits and effective weapons as they were eased into accepting Christianity, the Chinese scholar-officials were fascinated with the scientific and technological innovations of the West. Also as it was in Japan, at their prime the Jesuits converted up to 150,000 Chinese into Christians. Many Jesuits remained honorable guests and advisors for the rulers in China. In 1689 the Jesuits helped the Qing rulers to negotiate a Western-style international treaty with Russia, the Treaty of Nerchinsk.

Although having had its time, the Jesuit diplomacy came to an end both in Japan and in China. In Japan the political climate became increasingly unfavorable for evangelism. As the warring states gradually drew toward an end and unification emerged on the horizon, the Jesuits, as well as the firearms that they brought in, were viewed as agents that would upset the newly developed political stability. The Tokugawa government banned Christianity upon its successful unification in 1603, and by 1640 Christian influence in Japan diminished. The end of Jesuit diplomacy in China, on the other hand, was a result of the rites controversy. The strategy of cultural adaptation by the Jesuits was not always agreeable for other orders in Christianity; the Dominicans and Franciscans were among those who viewed such a strategy as compromising the integrity of Christianity. In 1704 the pope banned the use of the term "Tian" for translating the term "God." As the clashes continued to intensify, the Qing emperor Kangxi issued a decree in 1715 to repatriate all missionaries. After taking over the throne, Kangxi's son Yongzheng enforced the prohibition of Christianity much more strictly, thus marking the end of the Jesuit diplomacy.

Japanese Diplomacy under Tokugawa

The immediate challenge in discussing Japanese diplomacy under the Tokugawa (1603–1868) is to overcome the problematic use of anachronistic terms like "Japan" and "diplomacy," which imply contacts between sovereign nation-states. In fact, the Tokugawa polity was nowhere near as coherent and centralized as modern nation-states, and current research challenges even the use of the word "Japan" to refer to the political unit that covered the archipelago. Certainly, an understanding of Japan as a cultural entity did exist during the Edo (Tokugawa) period and can be dated back to the *Kojiki*, a chronicle compiled in the early eighth century. However, the Tokugawa were, first and foremost, a samurai clan and recognized other powerful samurai clans as competing sources of (what moderns would consider) sovereignty in the archipelago by demanding personal loyalty from the clan leaders, known as daimyo.

Thus, the political reality of the Tokugawa state was a compartmentalized political structure, and "diplomatic" relations most often referred to relations between competing clans as well as their relations with the Tokugawa. As such, the biannual residency of all daimyo in Edo known as the *sankin kotai* (alternate attendance) system, established by the shogun (Tokugawa leader) in 1635, was a diplomatic strategy. By mandating that daimyo spend half their time in Edo and that their families reside there permanently, the Tokugawa government sought to strengthen their control over daimyo by keeping a close eye on them and holding their families hostage.

In this political climate, the shogun pursued two complementary approaches when

➤ GRAY AREAS—EZO AND THE RYUKYUS

Nowhere is the ambiguous nature of foreign relations under the Tokugawa better illustrated than in cases where the Tokugawa government delegated contact with non-Japanese to a specific clan instead of managing it directly. Ezo, a vague term used by the Tokugawa to denote the islands north of Honshu, was maintained as a semisettled border zone by the Matsumae clan, based on the southern tip of Hokkaido. The semisedentary way of life of the indigenous Ainu inhabitants of the islands was increasingly undermined by disease epidemics and Japanese encroachment. The Ainu gradually grew economically dependent on Matsumae and Tokugawa merchants, which the Tokugawa thought would help ensure a hostile reception for Russian explorers and merchants coming south from the Sea of Okhotsk.

Unlike Ezo, at least the southern tip of which was regarded as part of the Tokugawa polity, the Ryukyu kingdom, located south of Japan with Okinawa as its largest island, nominally existed outside of the polity. However, despite the Ryukyu kingdom's public status as a Chinese tributary state, it had been under the control of Satsuma samurai from southern Kyushu since 1609. Sugar revenues from plantations on the islands were sent north along with trade goods brought by Chinese and other Asian ships, which were free to dock in the Ryukyus.

—Viktor Shmagin

negotiating with non-Japanese people, both based on his position as the head of the Tokugawa clan: he dealt with foreign nations directly through an elaborate and highly selective protocol while at the same time tightly regulating the ability of other clans to have any contact with non-Japanese peoples. By controlling access to outside goods, people, and information, the Tokugawa sought to center the clans' attention on Edo, but naturally their ability to do so waxed and waned before collapsing completely in the 1868 Meiji Restoration.

The Tokugawa polity had numerous points of contact with the outside world. The edicts promulgated by Tokugawa Iemitsu in the 1630s, often collectively referred to as the *sakoku* (closed country) edicts, did not actually close

the Japanese islands to foreigners. Instead, they tightly regulated the basis of diplomatic contacts and trade (often synonymous) relations with non-Japanese people in line with evolving Tokugawa priorities. In fact, until the late eighteenth century, there was no understanding of the edicts as formulating anything like a coherent exclusion policy. Such an understanding was only proposed by supporters of the hard-line faction of Matsudaira Sadanobu within the Tokugawa government, supporters who interpreted historical facts selectively to push for a hard-line policy in dealing with increasing numbers of Western ships showing up in Japanese waters.

Unregulated trade with Europeans during the preceding Warring States period, especially with the Iberians, had made Europeans synonymous with firearms and Christian proselytizing in the eyes of the Tokugawa, both of which were also regarded as subversive. Consequently, the Tokugawa confined contact with the West to a small enclave of Dutch merchants on an artificial island in the middle of the bay of Nagasaki and tightly monitored the trade that passed through. The Tokugawa likewise saw diplomatic and military entanglements in Asia as dangerous but desired to trade with the continent and with Southeast Asia. Official trade with a limited number of Chinese ships was always permitted in Nagasaki, where the walled-in Chinese settlement fluctuated at around 2,000 people.

Chinese silks were exchanged for Japanese silver at such a rate that Japan became known in Asia as the “silver island,” and Japanese exports of silver amounted to as much as one-third of the world total in the seventeenth century. In 1668 the Bakufu put a stop on silver exports and turned instead to exporting copper and marine products, all with the aim of turning a profit. The Tokugawa also traded with Korea via Tsushima Island as well as through a Japanese settlement in Pusan, signifying that Iemitsu's ban on Japanese overseas travel was more flexible than the letter of his edicts would indicate.

This highly complex system eventually buckled under Western pressure, especially from the Russian drive south during the eighteenth and nineteenth centuries, and under political and economic crises long brewing in the Japanese archipelago. The Tokugawa's failure to

effectively monopolize foreign relations, both among Japanese clans and with the outside world, was complete by the time it signed the treaty of Kanagawa in March 1854 with Commodore Matthew Perry, opening Japan to American ships.

The Aesthetics of Diplomacy—Representations of Diplomatic Encounters

An ambassador, acting on behalf of his sovereign, became a key figure in political relationships during the first global age. Owing to the increasing significance of diplomacy as an arm of imperial policy, it was desirable to record ambassadors' encounters abroad as well as their reunions with their sovereigns. In many cases, a court chronicler and artist were commissioned and might even be sent to foreign embassies. For example, Gentile Bellini in the fifteenth century and Jean-Étienne Liotard in the eighteenth century were sent to the Ottoman Empire in order to satisfy the curiosity of Western nations about Eastern cultures. Peter Paul Rubens and Guido Reni also were among those who found themselves frequently in the position of ambassadors forming alliances and acting as mediators.

Not every diplomatic encounter was deemed important enough to be depicted artistically. A particularly challenging peace agreement and similar exceptional events warranted the time

and expense of painting. Consequently, in the fifteenth and sixteenth centuries diplomatic affairs were mainly recorded in manuscript and print. As diplomacy became institutionalized in the West, painters such as Vittore Carpaccio appropriated the legend of Saint Ursula to symbolize the subject of political courtship, Carpaccio creating idealized but authentic representations of diplomatic encounters of the time. An outstanding example of the Renaissance period and one of the few paintings commissioned by diplomats themselves is the portrait *The Ambassadors* by Hans Holbein the Younger (1533), which shows two French diplomats sharing the class consciousness of an emerging elite, united by a sophisticated concept of concord, governance, and education.

In the modern period, specific forms developed for representing the diplomatic encounters of both ambassadors and sovereigns, usually comprising the entry and procession, the reception, and the negotiation or submission or the affirmation of alliance and festivities. To emphasize the magnificence of an embassy, the length and splendor of the procession were highlighted in a similar manner to the traditional depiction of royal entries. These processions often competed with the magnificence displayed by the host. Such grandeur was well illustrated in Luca Carlevarijs's work *The Entry of the Earl of Manchester into the Doge's Palace* (1717) in which the splendor of the ambassador's procession was overshadowed by the superior beauty of Venice itself. To underscore the importance of both the embassy and the monarch, the procession of the Turkish ambassador Mehmet Efendi after the audience with Louis XV (1722 by Pierre-Denis Martin) was presented as a great spectacle.

The theme of diplomatic reception fulfilled a similar purpose. During the fifteenth century, manuscripts that depicted ambassadors kneeling down or standing before the throne of the monarch became the official record of political relationships. For instance, Antoine Coypel's representation of the Persian embassy's arrival at the Salle de Glaces in Versailles (1717) demonstrates the splendor of the French king's court and royal authority, emphasizing how Louis XIV received tribute or gifts from subservient nations. And the *Staircase of Ambassadors* (ca. 1652) depicted

➤ GIFTS TO THE MUGHAL EMPEROR AND THE CHINESE EMPEROR

In diplomatic encounters between Europe and East Asia, the tribute of gifts in the Asian court was equally as important as showing reverence by prostrating and kissing the foot of the ruler. As well as luxurious materials and precious objects of art and crafts, technological presents such as clocks, telescopes, lenses, globes, and microscopes were decisive in forming alliances and achieving commercial objectives. An Indian illustration (Padshahnama manuscript, ca. 1650) presents an audience of the Mughal ruler Shah Jahan, dominating the scene from his royal gallery and surrounded by his entourage, depicted in a strictly hierarchical arrangement. Behind a rail at the bottom of the image the European ambassadors lined up in a row seem to play an inferior role in this ceremony. Their European attire with dark hats is emphasized together with their gifts, richly decorated boxes and jewelry.

In China Western missionaries, particularly the Jesuits, took a leading role in embassies, offering

technical objects and their scientific knowledge and services to the emperor. Matteo Ricci presented in 1601 the first chiming clock to Emperor Wan Li. The clock tower that Ricci was ordered to build to house the clock collection was depicted with Ricci's portrait and appeared in other images of Peking, such as the tapestry *The Voyage of the Emperor* (ca. 1730, New residence, Bamberg). An example where astronomical devices were given as tribute to the emperor is found in a print of a Dutch embassy from 1670. While the embassy is waiting for the audience in the court of Midday Gate, the gifts, including a globe, are examined. Only three years later the Jesuit Ferdinand Verbiest offered a celestial globe and an armillary sphere to Emperor Kangxi, seen later in a 1793 Chinese tapestry that shows the embassy of Lord Macartney offering gifts from George III (Maritime Museum Greenwich).

—Daniela Roberts

diplomats from different countries and continents to Versailles, including the apology from the Spanish ambassador. The reception of an ambassador of the Sublime Porte by Frederick the Great of Prussia, from a 1741 engraving, even suggests an equal relationship between Prussia and the Ottoman Empire. In the context of Christian missionaries, the reception of ambassadors was often presented as an allegiance of different peoples of the world to Catholic belief and the asserted supremacy of the Holy See.

The negotiation itself was seldom the subject of an illustration or work of art. A Flemish manuscript, *La vrai chronique d'Ecosse*, depicting a conversation between two ambassadors, was a rare example. It was far more usual to represent the diplomatic outcome of negotiations. A tapestry in the style of Le Brun showed with solemnity the signing of the contract of alliance between Switzerland and France under Louis XIV in front of an altar, viewed by the whole royal court; the tapestry was authorized by the king to apotheosize his reign. The painting *The Swearing of the Oath of Ratification of the Treaty of Münster* (1648) was executed by

the artist Gerard ter Borch, part of the Spanish embassy, for his own purposes. The idea of Concordia with the assembly of diplomats, including himself, was featured here. Diego Velasquez's magnificent painting *The Surrender of Breda* (ca. 1635), however, narrated the capitulation of a town, including the obedient surrender of the key after the lost battle.

Another popular subject was that of festivities. In the British study *The Field of the Cloth of Gold* (c. 1545), we see a lively narrative of the glamorous encounter of Henry VIII and Francis I that had been arranged by Cardinal Wolsey. Such events not only displayed the magnificence and splendor of sovereigns, their courts, and ambassadors but also provided suggestions to aristocrats for decorating their stately homes. For example, the sixteenth-century *Valois Tapestries* (ca. 1580, Uffizi) was commissioned to decorate a royal residence showing a ball in honor of the Polish embassy. In a painting by Francesco Guardi, we see Venice's Doge presiding in his magnificent hall, demonstrating his wealth and prestige at a banquet for ambassadors at his court.

Illustrations of embassies to the Middle and Far East depicted those rare and exceptional occasions when European fascination with exotic and wondrous worlds could be indulged and, indeed, vicariously experienced. A painting of an arrival of the Venetian embassy in Damascus (sixteenth century, Louvre) focused on the town's silhouette and its oriental flavor. In historical accounts, however, the strict ceremony of the high court of the Sublime Porte, the throne of the sultan, the role of Janishars and viziers, or the presenting of gifts and vestments can be seen as the main interest (the audience of Cornelis Calkoen and Vicomte d'Andrezel, by Jean-Baptiste van Mour, ca. 1724/1727). In an illustrated manuscript of 1586 (NB, Vienna, 8615,f.134v), the banquet displayed for the ambassadors leads one to believe that the Sultan watched the spectacle unseen from a barred window. Similarly, an Ottoman illustration presents the reception of Austrian ambassadors who, guided by two pashas, are obliged to take a deep bow before the throne (A. Feridun, 1568/1569).

By the nineteenth century the presentation of diplomatic encounters remained an important genre of historical painting, depicting both contemporary and past occasions while following iconographic traditions.

The Diplomacy of Commerce—European Merchants as Ambassadors

From the fifteenth century to the eighteenth century, European merchants served as liaisons for their respective states abroad. As official ambassadors and legates, or unofficial emissaries,

they served the diplomatic and economic interests of states while actively engaged in their own commercial activities. Representatives of the joint-stock companies were granted specific commercial privileges and autonomy in their dealings with non-European states, particularly in the New World and South and East Asia. In essence, European merchants were active participants in international affairs relating to the economic and political expansion of their countries of origin.

From the fourteenth century to the mid-sixteenth century, merchants throughout the Italian city-states, particularly in Venice, Genoa, and Florence, exerted considerable political influence in their respective states. Consequently, they were able to steer international policies toward expansion of their trade networks throughout the Mediterranean. Venice relied on its resident *baiulo* (diplomatic envoy) to ensure a stable commercial relationship over three centuries with Byzantium and later with its successor, the Ottoman Empire. Genoa and Florence retained similar officials in Constantinople, residing in specific quarters housing merchants and commercial warehouses. Such officials were responsible to their commercial interests back home, which also held considerable agency in the home government (e.g., the Venetian Senate). The complex relationship between merchants and their home governments influenced the appointment of diplomatic envoys and ambassadors. Venetian ambassadors were typically representative of the aristocratic merchant class and utilized the office of ambassador to create business contacts while residing at foreign embassies in both European and Muslim countries.

The growing importance of Atlantic trade networks—and after the initial voyages of discovery by the Spanish and Portuguese, the trade routes of the South Sea—led these southern European kingdoms to rely on merchants to represent the interests of the monarch overseas. Utilizing diplomatic methods similar to those developed by the Italian city-states, these merchants held charters that enabled them to negotiate treaties and even claim foreign lands. Historians recognize, however, that Spanish and Portuguese monarchs granted agency and concessions to ambassador merchants primarily

THE COMPLAINT OF THE NAWAB OF ARCOT

Robert Clive, British statesman and soldier. (Library of Congress)

At the end of the Seven Years' War (1756–1763) in Europe, the Second Carnatic War in South Asia began as a result of skirmishes between the British and French East India Companies. These private companies of merchant adventurers had involved themselves in the regional conflicts of local Indian rulers, and this interference in

local disputes opened the door to their participation in the selection of nawabs (Muslim provincial governors), particularly that of the nawabship of the Carnatic (coastal region of southern India). The major encounter of the Second Carnatic War occurred in 1751 as the French-supported nawab,

Chanda Sahib, laid siege to an English settlement. Robert Clive led the British forces to conquer Arcot, Chanda Sahib's capital. Clive's forces survived the counterattack on Arcot by the nawab's army, ensuring domination of the region by the British East India Company.

The post of nawab of Arcot (Carnatic) was created by the British to establish an Indian state dependent on the British East India Company. The French-backed rajah, one of the Mahratta (Hindu) princes, had been taken prisoner and deposed in 1751. Subsequently, his territory had been seized and transferred to the Nawab of Arcot by the company and set up as a protectorate to counter French ambitions in the region. Muhammad Ali Wallajah (r. 1749–1795) was made the independent ruler of the Arcot by the Mughal emperor in 1765. Wallajah supported the English against the French, leaving him heavily in debt and ultimately having to cede much of his domain to the British East India Company.

—Abraham O. Mendoza

because they would benefit directly rather than from an enlightened understanding of the interests of the merchants or of the nation. Portuguese explorers in Africa, Oceania, and South Asia acted on behalf of the kingdom of Portugal but also on their own initiative when conquering territories, creating colonies and establishing trade treaties with local rulers. Spanish merchants relied on Spanish clergy and military to conquer native peoples in the Americas, and these classes then secured their own claims from the monarch while utilizing colonial military forces to exact concessions and resources from the New World.

From the seventeenth century to the eighteenth century, England (Britain after 1707), France, and the Netherlands also relied on merchants to represent their political and economic interests as they advanced into the New World, southern Asia, and Oceania. The institution of the joint-stock company, chartered under the monarchs' auspices, allowed such corporate entities to expand into foreign lands with military

force as direct representatives of their respective countries. The establishment of colonies was financed by joint-stock companies because they provided the investment funds that were needed for colonization, which in some instances the home government could not afford. The Dutch East India Company (Vereenigde Oostindische Compagnie), the French East India Company (Compagnie Française des Indes Orientales), and the English East India Company all competed for territorial and commercial influence in South Asia and Oceania, leading to skirmishes and outright war throughout the seventeenth and eighteenth centuries, typically reflecting hostilities back in Europe such as the Seven Years' War (1756–1763). Through their charters, corporate officials from these companies were allowed to enter into direct trade negotiations, hostilities, and alliances with non-European states as full representatives of their home states. The direct relationship between state power and economic expansion abroad ensured the continuing importance of the merchant ambassador well into

the late eighteenth century. Among the more famous of the merchant ambassadors of this period are Robert Clive (1725–1774) of the English East India Company and Joseph François Dupleix (1697–1763) of the French East India Company.

Innovations in European Diplomacy

The shift from medieval to early modern systems of diplomacy between the fifteenth and eighteenth centuries marked a dramatic change in European mentalities and political structures. As kingdoms composed of multiple principalities evolved into more centralized national monarchies, the need to create loyal armies composed of native recruits rather than unreliable mercenaries became the norm. Growing interactions with the Islamic world and the Far East led Europeans (particularly Italian city-states such as Venice and Genoa) to exchange embassies, including with other European states. In addition, the need for parties to engage within a functioning international system to legitimize state-sponsored aggression rather than the former reliance on the will of the monarch to decide what constituted a just war also characterized the shift in diplomatic practices in regard to the conduct of warfare. Historians debate whether a diplomatic revolution emerged during the Renaissance or whether the institutions of diplomacy were in place in early periods.

At the conclusion of the hostilities of the Thirty Years' War in 1648, much of this decades-long conflagration still retained characteristics

of warfare from the Middle Ages. The use of mercenaries in the pay of foreign powers and the reliance on religious discourses and on the will of the monarch as a reason to engage in warfare all retained vestiges of medievalism. However, diplomatic innovations had taken place during this war. Such innovations include acknowledgment of international laws that recognized the nation-state as a legitimate actor in armed conflict, a set of recognizable logical needs and goals that all aggrieved powers could agree on, and the growing bureaucratization of the military under many of the powers involved. In this regard, the Thirty Years' War is illustrative of much of the old and much of the new in European diplomatic practices.

The centralization of the institution of the military took place at an accelerated rate during this period. France, Prussia, and England diminished the autonomy of their respective aristocrats and subsumed their political power to the needs of the state. In doing so, they also relegated segments of the aristocracy to run the military affairs of the state as members of the officer corps in the army and the navy. In this manner, the European monarchs diminished the reliance on mercenaries and reduced the independence of the nobility in conducting their own foreign policy, usually at the expense of the nation. The resulting institutionalization of the military created a reliable force that was free from external and internal competing influences and subject to the direct control of the national monarchy.

The international system of laws regarding war shifted from the religiously derived concept of divine right into a more nuanced system derived from natural law that recognized the need to declare war based on logical motives recognized by all states. The shift from warfare for the sake of fighting for religious expansion (typically utilized as an excuse) to warfare for reasons of state characterized this period. Innovations in international law are attributable to Jean Bodin (1529–1596), Thomas Hobbes (1588–1679), and Hugo Grotius (1583–1645). French jurist Jean Bodin established the concept of state sovereignty that recognized the ability of the state to declare war when aggrieved by foreign hostility in violation of its interests or sovereignty.

➤ HUGO GROTIUS, EXCERPT FROM *ON THE LAW OF WAR AND PEACE*, 1625

Historians credit the Dutch legal scholar Hugo Grotius (1583–1645) with establishing the first guidelines for international law among the European states. Grotius's approach to diplomacy work diverged from the conventional practice of applying concepts of divine right to a greater reliance on the emerging concept of natural law.

I. The disputes arising among those who are held together by no common bond of civil laws to decide their dissensions, like the ancient Patriarchs, who formed no national community, or the numerous, unconnected communities, whether under the direction of individuals, or kings, or persons invested with Sovereign power, as the leading men in an aristocracy, and the body of the people in a republican government; the disputes, arising among any of these, all bear a relation to the circumstances of war or peace. But because war is undertaken for the sake of peace, and there is no dispute, which may not give rise to war, it will be proper to treat all such quarrels, as commonly happen, between nations, as an article in the rights of war: and then war itself will lead us to peace, as to its proper end....

III. As the Rights of War is the title, by which this treatise is distinguished, the first inquiry, as it

Hugo Grotius was one of the most important legal theorists in the history of the West. His works on international law remain the theoretical basis of relations between countries, and his writings on "natural law" were even more important during his life. (Library of Congress)

has been already observed, is, whether any war be just, and, in the next place, what constitutes the justice of that war. For, in this place, right signifies nothing more than what is just, and that, more in a negative than a positive sense; so that right is that which is not unjust. Now any thing is unjust, which is repugnant to the nature of society, established among rational creatures.

—Abraham O. Mendoza

Source

Hugo Grotius. *On the Law of War and Peace* (Whitefish, MT: Kessinger Publishing, LLC, 2004), 3–4.

English philosopher Thomas Hobbes utilized the concept of natural law rather than that of divine right to legitimize the recognition of the absolute monarch in foreign affairs. Legal recognition of the conduct of war within a logical framework based on natural law could convince legal scholars to accept warfare as a viable policy rather than mere reliance on the religious whims of a monarch. Dutch legal scholar Hugo Grotius expanded on these concepts, proposing an internationally accepted process for conducting war. Only a legitimate head of state could propose foreign aggression by first declaring such state of war for legitimately accepted reasons. He also set up rules and guidelines in terms of the exchange of prisoners, the conduct of soldiers toward civilians, and dealing with infringements on legal matters by both parties engaged in a state of hostilities.

The recognition of the national monarch as the sole authority of the evolving state within an international system based on natural law rather than on divine right greatly influenced the practices of ambassadors and foreign diplomats engaged in pursuing the interests of state of their respective monarchs. Foreign diplomats in fixed embassies abroad had typically followed orders from home. Due to the changes in this period, diplomats were accountable to an international system as well as to their leaders at home. While such guides of conduct represented an often ignored ideal, it still constituted a significant shift in the diplomatic practices of ambassadors. International laws and conventions applied to the practices of ambassadors, holding them accountable to the new guidelines of the European state system.

Peace of Westphalia and the Creation of a New Order

The Peace of Westphalia (1648), which constituted two separate treaties, the Treaty of Münster and the Treaty of Osnabrück, formally concluded the hostilities of the Thirty Years' War (1618–1648) and the Habsburg-Dutch War (1572–1607, 1621–1647), respectively, as well as negotiated their terms for peace. While these wars, along with other conflicts such as the English Civil War (1642–1651) and the French Wars of Religion (1562–1598), constituted episodes of religious violence amid political contestations for hegemony by absolutist sovereigns, the Peace of Westphalia effectively recognized the primacy and legitimacy of the state as a legal entity. Both the Thirty Years' War and the Habsburg-Dutch War were fought by the Austrian and Spanish Habsburgs, respectively, to restore the universality of the Catholic Church against Protestant heresy, an issue that had been left unsettled since the Peace of Augsburg (1555), and to impose Habsburg hegemony. Effectively, the Peace of Westphalia created a diplomatic system of international law in which European states recognized the primacy of the state over that of religion within an international constitutional framework.

The congress of Westphalia first convened on December 4, 1644, in two German cities, Münster and Osnabrück. Representatives of Habsburg Spain, Bourbon France, and the United Provinces of the Netherlands, along with a papal mediator and imperial officials, met in Münster to negotiate a treaty ending the Habsburg-Dutch War. In Osnabrück, representatives of Protestant states of the Holy Roman Empire and Sweden

met with an imperial representative to conclude the Thirty Years' War. Both Sweden and France demanded that the Holy Roman emperor, Ferdinand III, allow for the inclusion of representatives from the individual states of the Holy Roman Empire in negotiations, which he initially resisted. By including them in the framework of peace negotiations, there was recognition on the part of all parties that individual states had a say, and therefore legitimacy, in diplomatic and international relations. While Swedish and French military power did prove to be a factor in persuading the Habsburgs, a desire for consensus was drawn from all sides after decades of endemic warfare.

The international diplomatic system devised at the Peace of Westphalia recognized the desire on the part of both Catholic and Protestant states of the Holy Roman Empire not to dismember this polity but also to confine the authority of the Austrian Habsburgs to their hereditary realms. Therefore, Frederick III remained Holy Roman emperor (a purely honorific status bestowed on the Austrian Habsburgs) but duly recognized the sovereign authority of the individual princes, bishops, and electors of the more than 300 constituent states of the Holy Roman Empire. These individual polities obtained the right to declare war, sign treaties, and levy taxes without any outside interference in their affairs. Moreover, the treaties also recognized the independence and sovereignty of the United Provinces vis-à-vis Habsburg Spain after eight decades of war. This mutual recognition on the part of all parties ensured the legitimacy of the sovereignty of the state, thereby eliminating by legal convention the prior assumption of the universality of both Catholicism and a united Christendom under one monarch.

Both France and Sweden, which both entered the Thirty Years' War on the Protestant side, also emerged from this conflict with their share of rewards at the expense of the Habsburgs and their allies. These concessions were sought as a means to ensure strategic advantages for themselves in the event of future hostilities in central Europe. Sweden acquired a portion of Pomerania along the Baltic as well as the cities of Wismar, Bremen, and Verden. France obtained a string of cities and territories

➤ RICHELIEU, FRENCH FOREIGN POLICY, AND CATHOLIC UNIVERSALISM

The French absolutist state, under the leadership of King Louis XIII's chief minister Cardinal Armand Jean du Plessis de Richelieu, developed a foreign policy designed to thwart both the Spanish and Austrian Habsburgs and establish French hegemony in Europe. Habsburg pretensions at reestablishing Catholicism throughout all of Europe, with themselves at the helm, was a threat to France's power. In an effort to confront this threat, Richelieu entered France into the Thirty Years' War on the side of the Protestant German states and Sweden against his fellow Catholic Habsburgs in Austria. His support for the Dutch in the Habsburg-Dutch Wars was criticized by those who viewed French flirtations with Protestants as treachery. Despite Richelieu's persecution of the French Huguenots within France, he was still guided by realism in foreign policy in engaging France's enemies. Moreover, because he was a Catholic cardinal and thus a top-ranking official of the Roman Catholic Church, his actions as chief minister illustrate that his loyalties belonged to the French state. This is indicative of the development of foreign policies geared more by state interests rather than by purely religious motivations during this period of early modern European history.

—Abraham O. Mendoza

along the Rhine. Moreover, the elector of Brandenburg obtained the cities of Minden, Halberstadt, and Magdeburg, contributing to his state's development into the powerful state of Prussia.

The Peace of Westphalia also addressed issues that had lingered unresolved since the Peace of Augsburg of 1555. The agreement recognized Calvinism on par with Catholicism and Lutheranism (still excluding other faiths within the imperial realms). Moreover, if a sovereign changed his religion, his subjects would not be forced to comply with such a change themselves (which negated the Peace of Augsburg). In addition, if a bishop, either Catholic or Protestant, changed denomination, he would have to resign his post. With the instituting of these changes, the state and its institutions (e.g., the

bureaucracy, the military, and the sovereign) became the primary agent of sovereignty, with religion and religious institutions receding as an integral legal element of power over the populace. However, this did not mean that religion lost all importance in European politics and society. Nonetheless, the precedent of an international system of states established by the Peace of Westphalia has developed into a world system in contemporary history.

Religious Truces in Europe

Throughout the medieval period, western Europe was unified religiously under one Christian Church. However, this unity became fragmented after 1517 when Martin Luther nailed his 95 theses to the door of the church in Wittenberg, Germany. The results of this act sent shockwaves throughout Europe and affected all areas of society. This fragmentation shook the Europeans to their core and divided people of all classes. In many cases, this division led to a great amount of conflict and threatened to tear apart several countries. It became increasingly clear as time went on that truces would need to be settled so that the religious fragmentation did not become a political one as well.

The Protestant Reformation began in Germany, and thus the political instability began there as well. Holy Roman Emperor Charles V was a Habsburg and a Catholic; therefore, he was staunchly opposed to the existence of the reformed religion in his domains. However, some of the German princes had other ideas. While they were nominally loyal to the Holy Roman

Emperor, the new religion proved to be very enticing to some of the rulers, and they began to support Luther. In 1521 Charles had Luther's works banned at the Diet of Worms. This caused a reaction by the princes and led to a decade of tensions before the Schmalkaldic League was formed in 1531. The formation of the league was for defensive purposes, and all of the members promised 10,000 infantry and 2,000 cavalry should the need arise. This need became more apparent in 1541 when Charles V began forging alliances with both sides of the religious line, especially Pope Paul III and Duke Maurice of Saxony. These alliances prompted the Schmalkaldic League to start a preemptive war against Charles in 1546. Even though the imperial forces were victorious, Charles wanted to make some sort of compromise to help relieve the tension. On May 15, 1548, the Interim of Augsburg was signed by Charles V. It made concessions to the Lutherans by allowing marriage of the clergy and communion in two kinds, but it still called for the Lutherans to readopt Catholic doctrine and practice. The Protestant rulers rejected this document and instead signed the Peace of Leipzig in 1549. In 1552 Elector Maurice of Saxony revolted against the emperor, and the interim was overthrown. However, by this time most had grown weary of the fighting, including the Catholic princes and Charles. As a result, the Peace of Passau was negotiated. This document gave Lutherans religious freedom until the next Imperial Diet, which was called for 1555 in Augsburg. Here the Peace of Augsburg was signed on September 25, 1555. It called for a religious truce and established *Cuius regio, eius religio*, or "Whose the region, his the religion." Instead of accepting Lutheranism as a separate religion within the German territories, the Peace of Augsburg stated that the ruler had the right to choose the religion of his realm. Any who lived within the territory were required to follow the official religion chosen by its ruler, and a grace period was provided in which people were allowed to move to another territory where their chosen faith was practiced. While the Peace of Augsburg served as a sufficient toleration for Lutheranism in Germany, it did not account for the further splintering of Christianity. Once other groups such as Calvinists and

Anabaptists began forming, a new peace needed to be worked out. That materialized in the form of the Peace of Westphalia in 1648. With the end of the Thirty Years' War, these groups finally received official recognition within the empire.

At the beginning of the Reformation, no one could guess that Luther's reformed religion was only the beginning of the fracturing of Christianity. Soon John Calvin's ideas began spreading as well. Calvinism spread to France in the 1530s, and by the 1560s those who adhered to it were known as Huguenots. The two religions did not coexist peacefully, as the Huguenots began openly criticizing the Catholic Church and its practices. Their criticism went beyond words, as many of the Huguenots were involved in bouts of iconoclasm in which they smashed statues and other religious items that they viewed as "idolatrous." The Catholics could not tolerate these actions and soon met them with violence. The Huguenots lived mostly in the south, but the fight moved into the royal court as some prominent members of the nobility, including princes of the blood, became Huguenots as well. Some of the most powerful nobles, namely the Guise family, were staunchly Catholic, and as a result they formed the Catholic League in order to fight the Huguenots. During this time Charles IX (1550–1574) ascended to the throne at the young age of ten, requiring his mother, Catherine de Medici, to be his regent. A religious war broke out in 1563 but was quickly ended with an armed four-year peace. Charles IX declared his majority that year, but he was both physically and mentally weak, meaning that Catherine continued to dominate the political scene. Catherine was interested in a truce, as she saw that France was in danger of civil war. Two more wars followed between 1567 and 1570, with Catherine granting more concessions to the Huguenots, but still no compromise could be reached, only another uneasy truce. Finally, Admiral Coligny changed everything.

Coligny was the leader of the Protestants in 1570 and managed to become a close confidante of the king. In the meantime, Catherine began arranging the marriage of her daughter, Marguerite, to Henry de Bourbon, the prince of Navarre, who was a Protestant. Catherine hoped

THE ASSASSINATION OF ADMIRAL COLIGNY

The events that took place on St. Bartholomew's Day, August 24, 1572, began with an attempt at the life of Admiral Coligny and ended with the brutal massacre of thousands of Huguenots all over the country, although the violence was mostly concentrated in Paris. Immediately after the admiral was shot, many already suspected the dowager queen, Catherine de Medici, as being the culprit who ordered the assassination. At the time there was no proof that Catherine was indeed behind the deed, and she never admitted her culpability. However, a memoir written by her son Henry, who at the time was the Duke of Anjou and would later become King Henry III, implicated his mother as well as himself as the ones who inadvertently instigated the violence that ensued that night. Even though Catherine had been searching for a truce between Catholics and Protestants by arranging the very marriage that provided the scene of the massacre, more important was the future of the dynasty, and Coligny had become a threat to it.

"Feeling assurance, from the menacing conduct of the king, that the admiral had inspired his majesty with a bad and sinister opinion of the queen my mother and of myself, we resolved to rid ourselves of him, and to call to our aid Madame de Nemours, to whom we held that we might reveal our projects from the mortal hate which we knew that she bore towards the said admiral. . . . The queen my mother and myself thereupon resolved to employ Maurevel, as being an instrument more fit to achieve our designs, and one already experienced in the deed of assassination. . . . [We] found no better expedient than . . . that the shot (coup d'arquebuse) should be fired from the window of the house where Villemur lodged—a spot very conveniently placed for our enterprise."

Martha Walker Freer, *Henry III, King of France and Poland: His Court and Times*, Vol. 1 (London: Hurst and Blackett, 1858), 115–117.

that the marriage would solidify the truce and ease tensions. In 1572 Catherine became especially worried about Coligny when he attempted to convince the king to ally with the English in order to help the Dutch in their rebellion against Spain. The thought of this horrified Catherine. Not only was France not equipped to fight the armies of Philip II, but it was also a Catholic country, and she could not foresee fighting another Catholic in order to help Protestants. This finally prompted Catherine to plan Coligny's assassination. The controversial marriage occurred on August 18, 1572. Four days later on the Feast day of St. Bartholomew, an attempt on the life of Coligny sparked a bloody massacre that resulted in the deaths of several thousand Protestants both in Paris and in the provinces. This event, more than any other, served to temper the Protestants, as they lost a majority of their leaders in the massacre and were also too afraid to fight the Catholics. Matters stayed the same, as Charles died in 1574, and his brother, Henry III, died in 1589. Henry's death meant the end of the Valois dynasty because he had no sons to inherit

the throne. This meant that the next person in line was Marguerite's now ex-husband, Henry de Bourbon. Henry understood that the majority of French people would not accept a Protestant king, so he converted to Catholicism before his coronation in 1594. Despite his conversion, he managed to finally enact a law that would bring about true religious tolerance in France. The Edict of Nantes (1598) guaranteed freedom of conscience and provided civil rights for the Huguenots. It also allowed the Huguenots to practice their religion within specific areas and gave them the right to keep certain "places of safety." This edict effectively ended the Wars of Religion in France.

Finally, England also saw religious strife, although it was not nearly as bloody as what was seen on the continent. Henry VIII's defection from the Catholic Church was mostly a political move, as Pope Clement VII was unable to grant him an annulment from his first wife, Catherine of Aragon. Because of this, the Church of England leaned doctrinally more toward the Catholic Church and retained many of its rituals.

Henry VIII's successor, Edward VI, was a staunch Protestant and instituted radical changes in the Church in order to comply with his personal beliefs. His short reign was followed by that of his sister, Mary I. As a Catholic, Mary was determined to return her kingdom to Rome; however, her reign was too short for her to be able to fully see this through. Finally, her sister Elizabeth I ascended in 1558, and as she was a Protestant, most expected her to return the Church of England to what it was under her brother. However, despite being a Protestant, Elizabeth was less concerned with religion and was more concerned with the unity of her kingdom. The new Act of Supremacy and the subsequent Act of Uniformity passed by Parliament in 1559 established what is known as the Elizabethan Settlement. The Act of Supremacy established Elizabeth as supreme governor of the Church ("head" was not used, as many feared a female leader) and separated England once again from the Catholic Church. The Act of Uniformity was passed in order to establish a common mainstream church that all subjects would be required to adhere to. England still had groups of Catholics and Calvinists (known today as Puritans) who were unhappy with the state of the Church of England. Both groups wanted reforms, and they were very vocal about it. The Act of Uniformity attempted a settlement by instituting a law that required all subjects to attend the Church of England or pay a fine. The act also attempted a compromise by allowing more freedom of worship within the Church. For instance, the new Book of Common Prayer allowed for people to view Communion as they chose, and they could either kneel or stand. Some elements of the Catholic Church remained, such as vestments and Communion wafers (instead of bread). Other vestiges of Rome were removed, such as the rood screens and candlesticks. Despite the continued protests of the fringe groups, Elizabeth's reign of 40 years allowed the settlement to cement. In fact, the modern-day Anglican Church still closely resembles the church of Elizabeth.

While these truces did bring about peace, they were not necessarily permanent and did not guarantee lasting peace. The Edict of Nantes, which had provided a reprieve from the violence of the religious wars, was revoked by

King Louis XIV in 1685, making Protestantism illegal and causing an estimated 400,000 Huguenots to leave France. In England, while the Church of England remained intact as Elizabeth had left it, the strife between the Calvinists and the adherents of the Anglican Church continued especially with the kings of the Stuart dynasty, which played a part in the English Civil War (1641-1649). In addition, Catholics remained legally excluded from Parliament or holding any other position within the government until the nineteenth century.

Peace of Karlowitz and the End of Ottoman Expansion

The Peace of Karlowitz of 1699 formally ended the Ottoman expansion into eastern Europe and recognized Habsburg hegemony while marking the beginning of Ottoman decline. The Habsburg-Ottoman War (1683-1699) took place simultaneously with Ottoman conflicts with Poland (1683-1699) and Russia (1686-1700). Ultimately, all three would unite as the Holy League against the Turks. While warfare in eastern Europe had been endemic in the seventeenth century, with the Ottomans at war with any one of these European powers, the Peace of Karlowitz stood as a benchmark in Habsburg-Ottoman diplomatic relations, with the former holding the upper hand. Moreover, the Habsburg realms, under the rule of Holy Roman Emperor Leopold I, expanded at the expense of the Ottomans rather than merely repelling their advances into central Europe.

In 1683 the Ottoman empire initiated war against Habsburg Austria by launching a major invasion directed at taking Vienna, the Austrian capital. The grand vizier, Kara Mustapha, led his Ottoman troops toward Vienna, arriving at the Austrian-Turkish border on July 1, 1683. Within two weeks Ottoman forces had encircled

THE SECOND BATTLE OF MOHACS

While the First Battle of Mohacs (1526) marked the ascension of the Ottoman empire in its farthest advance into Europe, given its defeat of Hungarian and Bohemian forces, the Second Battle of Mohacs (1687) constituted a key battle in expelling the Turks from eastern Europe and relegating them to the Balkan and Black Sea region. As such, the battle marked a significant benchmark in the course of the long history of the Habsburg-Ottoman Wars. After defeat at the Battle of Buda in 1686 the Ottomans sued for peace that was rejected by the Holy League, which sought to break Ottoman power. Habsburg and League forces under Charles, Duke of Lorraine, were sent into the lower Danube Valley near the town of Mohacs. On August 12, 1687, this force met the grand vizier's Ottoman armies, which immediately attacked and were promptly met with a fierce counterattack by Habsburg forces. Following the battle the Ottoman empire entered a severe political crisis, given widespread mutiny among the ranks and the disintegration of the Ottoman armies as well as a rapid transfer of power within the Sublime Porte. Moreover, this political instability allowed Habsburg forces to continue unabated as they ousted the Ottomans from Hungary and Transylvania.

—Abraham O. Mendoza

Vienna, with their cavalry looting and pillaging the Austrian countryside. Vienna was left with a garrison of a mere 11,000 troops. Poland, Saxony, and Bavaria sent contingents of troops to support Leopold's remaining field army and engage Ottoman forces surrounding the capital. In the meantime the Vienna garrison had successfully held back the Ottoman forces, regardless of their siege works, tunnels, and attempts to break through city walls. By September, Leopold's allies under the direction of Polish king John Sobieski defeated Ottoman forces, who abandoned their positions around Vienna, leaving much of their equipment and supplies behind.

In the following year, the Holy League (Austria, Venice, and Poland) was formed to take the initiative to drive the Turks out of Europe to follow up on the Ottoman failed siege of Vienna. Venice successfully drove the Turks out of Morea

in Greece. Austrian forces were able to capture key Turkish fortresses in the Danube region piecemeal within six years. Leopold I captured Gran (1683), Neuhausel (1685), Buda (1686), Esseg (1687), and Belgrade (1688), thereby pushing the Ottomans out of Hungary, Transylvania, Croatia, and Slavonia. At the Battle of Mohacs (1687), Habsburg forces soundly defeated Ottoman forces, reversing the Ottoman advance into eastern Europe. As Leopold captured these areas, he called for local elites to recognize his rule over them. Prince Eugene of Savoy (1663–1736) was Leopold's main general in his engagements against the Turks and proved himself to be a worthy leader. However, when France began the Nine Years' War (1688–1697), Austrian forces were caught in a two-front war. This allowed Ottoman troops to recapture Belgrade in 1690. However, for the rest of the decade the Ottomans were not able to advance against smaller, yet effective, Austrian forces along the Danubian front. In 1697 in the Battle of Zenta in Serbia, Eugene thwarted Ottoman forces, under the command of the sultan, attempting to cross the Tizsa River, smashing the bridgehead held by Ottoman janissaries. When the sultan had his *spahis* cross the bridge to assist the janissaries, the clogged bridge became a death trap, with thousands of them attempting to flee across the river and meeting their end by drowning en masse. As a result, the Ottomans were forced to acknowledge that the reconquest of their eastern European provinces was no longer possible. Their acquiescence resulted in the Peace of Karlowitz in 1699.

On January 1699 in the Serbian town of Sremski Karlovci (known as Karlowitz in German) a peace treaty was signed, after a two-month congress, that formally ended the Habsburg-Ottoman War as well as Ottoman conflicts with Poland, Venice, and Russia. In the Treaty of Karlowitz, the Ottoman empire formally ceded Hungary to Austria, Podolia (southwestern Ukraine) to Poland, and Dalmatia and Morea to Venice. While this diplomatic arrangement did not end Ottoman power in eastern Europe, it certainly did not allow for its further expansion at Habsburg expense. By 1715 the Ottomans declared war against Venice, retaking Morea. Austria responded by crushing Ottoman forces

at the Battle of Petrovaradin (Peterwardein) in 1716 and retook Belgrade. With the resultant Peace of Passarowitz of 1718, Habsburg Austria gained western Wallachia, northern Serbia, and the Banat from the Ottomans. Since the Peace of Karlowitz, the Austrians had proven able to be actively engaged against the Ottomans and pushed them into the Balkans. However, Venice was unable to regain its lost Mediterranean territories, while Poland and Russia, able to match Ottoman power at various points, were still not capable of reaching the Black Sea region. Karlowitz ensured that Habsburg hegemony of the region would prevent future Ottoman incursions into what were now the southeastern provinces of Austria.

The Salé Rovers

Situated along the estuary of the Bou Regreg, near the Atlantic coast of Morocco, the Muslim city of Salé emerged briefly as a self-governed pirate republic between 1627 and 1668. Less organized freelance piracy had existed in this region since the decline of the Roman empire. However, as long-distance overseas trade continued to shift its focus from the Mediterranean toward the Atlantic through the sixteenth and seventeenth centuries, the city's inhabitants were ideally positioned to harass and prey upon the latest shipping lanes that connected western Europe with the Americas, Africa, and Asia. For the light, swift caravels and galleys leaving Salé, lurking in wait off the Azores, Madeiras, or Canaries, where there was often a confluence of foreign merchant ships laden with specie and goods from around the world, did not require a prodigious sea voyage.

The Salé pirates, often referred to as rovers, operated independently of the corsair enclaves that dotted the Barbary Coast of North Africa. They represented an unusual collection

of indigenous peoples, religious refugees, and foreign renegades not subject to Moroccan rule or that of the Ottoman empire. The republic they created treated piracy as a business, and it derived its authority to enforce law and order by virtue of its financial success. A divan, or inner council, along with two elected officials responsible for the land defenses of the city and administration of the rover fleet, made up the core of their governing body. Although the divan was responsible for all government and public works, it was the rovers who supported the republic's treasury with a flat percentage from each prize taken. In effect, they constituted stockholders in a joint enterprise in which they and their government shared in both the risk and the profit of each illegal seizure made at sea. For approximately 40 years their city's local markets swelled with these stolen trade goods, while only a few items for sale, namely fish and timber, were actually produced legally in the vicinity of Salé.

There is no single dynamic event that explains Salé's expulsion of the Saadi dynasty and its subsequent break from Morocco in 1627. Instead, there appears to have been a combination of political and socioeconomic conditions (at home and abroad) that triggered the city's push for autonomy and the rebirth of its pirate community. First, the death of Ahmad al-Mansur, the Saadian ruler whose dynastic line had dominated Morocco with a firm hand for nearly 100 years, left a distinct power vacuum at Salé beginning in 1603. As his sons descended into a protracted succession war, they lost control of the city, along with two other nearby seaports at Mamora and Larache. Aside from civil unrest, a second major factor at work was the influx of Morisco refugees, Muslims who were being persecuted and thrown out of Catholic Spain between 1609 and 1614. Some historical estimates indicate that the Spanish Morisco population exceeded 13,000 at Salé by 1627. This rather profound demographic shift may have also had an impact on the number of underemployed and perhaps served as an added incentive toward a life of piracy.

Salé also attracted a growing community of renegade seafarers from England, France, and the Netherlands as well as Italy and Greece. Many of these individuals had drifted into piracy

➤ JAN JANSSEN

Renegade European seafarers, like the Dutch privateer Jan Janssen, readily adopted the foreign cultural traditions of Salé in exchange for socio-political and economic advancements within the pirate republic, particularly during its heyday in the 1620s. Born in the city of Haarlem, Janssen began his career at sea raiding Spanish shipping during the period of the Netherlands Revolts. He eventually fell captive to Algerian corsairs while cruising the merchant lanes off the Canary Islands in 1618. It is uncertain how Janssen was initially received by the Algerians. After all, by the time of his capture he was already an experienced seafarer, well versed in ship handling, gunnery, and boarding maneuvers, and he had been trained by professionals in western Europe. Clearly his captors respected this knowledge and skill, as they ultimately allowed him

to join their crew rather than remain a slave. Within a year, Janssen had voluntarily relocated to Salé and converted to Islam, taking the name Murat Reis, and he even married a local Moroccan. Although these may have been tactical maneuvers intended to secure greater wealth and social freedoms (rather than a genuine conversion or assimilation), the process still involved significant adaptations in language, customs, food, dress, and social relationships. Janssen, as Murat Reis, rose to local prominence and quickly established himself within the government framework of the Salé Republic. He even attained the elected position of admiral and was responsible for the city's rover fleet, pushing its slave raids as far north as Ireland and Iceland between 1619 and 1631.

—Eric Emery

from naval warships or licensed privateers, a legacy of the reduction in forces that punctuated each of the religious wars in Europe between the 1560s and the 1650s. The English, in particular, returned almost immediately to the crafts of piracy and slave trading in the Atlantic shortly after signing the Treaty of London with Spain in 1604. And although exploration, trade, and fishing absorbed a great deal of its professional sailors, these activities alone could not account for all of those displaced and left idle by the peace. By the 1620s, the English, French, and Dutch mercantilist states had also begun to monopolize the seaborne commerce of the Atlantic, surgically destroying and then supplanting the local shipping networks along the coast of Morocco and the rest of Africa. In turn, this practice encouraged the more seasoned European captains, officers, and sailors to volunteer their services aboard renegade vessels in search of more money and fewer restrictions. Moreover, the practice enticed local merchants from the minor seaports like Salé to use fishing and piracy to compensate for lost revenues.

Around 1651, the Salé rovers hit the high-water mark of their success. The rover fleet employed nearly 50 vessels, with mixed crews of Moroccans, Moriscos, and Algerian Berbers, many of whom were trained in ship handling,

gunnery, and boarding maneuvers by professionals from Europe. The rovers stole and resold an impressive array of foreign cargos: wine and oils from Spain, Portugal, and France; gold, timber, and slaves from Africa; sugar, gold, silver, and furs from the Americas; and silk, cotton, indigo, pepper, and spices from India and Indonesia. They also conducted raids and looted on land, thus supplying the slave trade with Christians from as far away as Newfoundland and Iceland and closer to home along the coasts of Ireland and the English West Country. After multiple failed attempts to break the rovers' hold on Salé (1629–1650), the monarchies of northern Europe resorted to diplomacy, and in some cases tribute payments, to protect their interests in the Atlantic. Dutch consuls even went as far as to legitimize the pirate republic with a formal treaty in 1651.

The Alaouite dynasty eventually managed to bring Salé back under the central authority of Morocco in 1666. The bulk of the rover fleet dissolved shortly thereafter, suffocated, at least in part, by tax increases and restrictive economic policies between 1666 and 1668. At the same time, the new mercantile powers of Europe were starting to use their enhanced social position to aggressively petition their government navies for more protections against piracy, such

as armed convoys of warships outfitted with the latest in long-range guns.

The Barbary Problem— Diplomatic Accommodation in the Contested Mediterranean

The North African regencies of Algiers, Tunis, and Tripoli—often known as the Barbary states—are among the most poorly understood states of the early modern period. Generally dismissed as little more than pirates’ lairs, they have been all but libeled in centuries of Western writing. Yet from the sixteenth century, when they became semiautonomous provinces of the Ottoman empire, they played a key role in the trade and diplomacy of the Mediterranean and helped shape the contours of European and United States politics into the early nineteenth century.

Following the collapse of the Almohad dynasty in the thirteenth century, political control in western North Africa was divided among the Hafsids in what are now Tunisia, the Marinid kingdom of Morocco, and other lesser states. Following the overthrow of the Muslim emirate of Granada in 1492, the Spanish and Portuguese pushed their reconquista into North Africa proper, raiding and capturing more than half a dozen coastal settlements in Morocco and Algeria between 1497 and 1510. (Spain retains five such territories, known as *plazas de soberanía*, the largest of which are Ceuta and Melilla.)

In the early 1500s the corsair brothers Aruj Pasha and Hayreddin Pasha—known as the Barbarossas—fled Ottoman lands in the eastern Mediterranean due to their association with a brother (and rival) of the newly installed Sultan Selim. The Algerines appealed to the Barbarossas for help against the Spanish, and they took the port of Algiers in 1516. On his brother’s death in 1518, Hayreddin Pasha turned to Selim for support, and Tunis and Algiers fell into the orbit of the Ottoman empire. A wide range of contemporary European documents indicates that in the sixteenth and seventeenth centuries the regencies were among the richest and safest places in the Mediterranean and that their laws were administered with greater justice than in much of Europe.

The regencies frequently contributed their ships to Ottoman fleets, particularly those sailing against the perennial enemy, Spain. The Ottomans depended especially on the Algerine fleet to represent their naval power in the

Ottoman admiral Hayreddin Pasha, known as Barbarossa, helped bring northwestern Africa into the Ottoman Empire. (Christie’s Images/Corbis)

► THE ANGLO-BARBARY THREAT TO AMERICAN SHIPPING IN THE MEDITERRANEAN

Following the American Revolution, U.S. merchants no longer enjoyed the protection of the Royal Navy, and many Britons hoped that American trade might be strangled at birth. In his *Observations on the Commerce of the American States* (1783), Lord Sheffield saw a role for the Barbary regencies in ensuring this outcome: “It is not probable that the American States will have a very free trade in the Mediterranean,” he predicted. “It will not be to the interest of the great maritime powers to protect them from the Barbary States. If they know their interests, they will not encourage the Americans to be carriers. That the Barbary States are advantageous to maritime Powers is certain.”

While serving as U.S. minister to France, with authority to negotiate treaties with the Barbary states, among others, Benjamin Franklin confirmed Sheffield’s point in a letter written the same year: “I think it not improbable that those Rovers may be privately encouraged by the English to fall upon us, to prevent our Interference in the Carrying Trade; for I have in London heard it is a Maxim among the Merchants, that, if *there were no Algiers*, it would be worth England’s while to build one.”

—Lincoln P. Paine

Benjamin Franklin, *Writings* (New York: Library of America, 1987), 1072; John Baker Holroyd, Earl of Sheffield, *Observations on the Commerce of the American States*. . . (London: Printed for J. Debrett, 1783), 204.

western Mediterranean, and several Algerines became *kapudan pasha* (admiral) of the Ottoman navy. Hayreddin Pasha led the Ottomans to victory at the Battle of Prevesa (1530) off Greece, while a successor, Uluj Ali, was the most successful commander in the Ottoman defeat at Lepanto (1573) and was afterward charged with rebuilding the fleet.

The fact that the corsairs operated from Muslim ports and with the sanction of Muslim rulers tends to mask the fact that many of the crew and a high percentage of the officers and commanders were Christian converts to Islam (or renegades, in the European view). There were

also considerable numbers of Christian pirates and privateers operating out of Livorno (Leghorn), Italy, and Malta, where the Knights of St. John had relocated after the Ottoman capture of Rhodes in 1522. Moreover, the French, English, Dutch, and other enemies of Spain cultivated commercial and diplomatic relations with the regencies, although the position of the latter was complicated by the fact that pirates of all nations sold goods, ships, and people—whether legally or illegally acquired—at Algiers, Tunis, Tripoli, and other ports. Captured crews and passengers were held for ransom or sold as slaves, as was common around the Mediterranean and even in northern Europe.

Although as an independent kingdom Morocco is generally treated apart from the Barbary regencies and many of its principal ports were held by the Spanish or Portuguese, the Atlantic coast port of Rabat/Salé became a center of corsair activity following the settlement there of Moriscos (Spanish Muslims) expelled from Spain in 1609. The initial focus of the so-called Salé rovers was Spanish shipping, but under the command of Christian renegades (or Muslim converts)—notably Murat Reïs, originally Jan Jansz, of Haarlem, Holland—in the 1620s they raided as far as the British Isles, Iceland, and Newfoundland. Barbary hostilities against merchant shipping in the Mediterranean and the Atlantic peaked in the first half of the 1600s, but accurate figures are difficult to obtain, and the actions of Barbary corsairs can only be assessed adequately alongside those of the more numerous Dutch, English, French, Italian, and Greek privateers and pirates.

The major European powers occasionally sent fleets to the regency capitals to secure better treatment for their nationals or to ransom slaves. But Algiers, for one, was as big as London and derived revenues from far more than corsairing and slave trading. In time, Europeans realized that the most economical approach was to make treaties with the regencies to guarantee safe passage for their ships while encouraging attacks on those of their rivals. This remained standard policy until the start of the nineteenth century, when Britain, France, and the United States deployed their fleets to enforce the abolition of corsairing, which effectively ended in 1816.

Commodore Anson's Embassy, 1743

Besides securing his personal fortune and future political career, Commodore George Anson's circumnavigation of the globe in 1740-1744, and particularly his stay in Canton in 1743, significantly altered British and European views of China, its government, and its military capability. Prior to the 1748 publication of Anson's *A Voyage round the World*, European intellectuals, such as Voltaire, were impressed by Chinese silks and ceramics and considered the distant Asian nation to be intellectually and morally superior to Europe. But Anson's harsh account of the ill treatment that he and his men received in Canton while seeking to resupply themselves for the voyage home led many Europeans to dismiss the Chinese government as corrupt and weak and the Chinese people as arrogant and deceitful.

In November 1742 the *Centurion*, the last of six vessels with which Anson had begun his voyage, arrived at Macao, the Portuguese trading post on the southern Chinese coast. The unexpected arrival of the first British warship to appear in Chinese waters discomfited officials of both the Chinese government and the British East India Company. In desperate need of repairs and supplies, Anson, who had little knowledge or experience of Chinese laws or customs, expected to have his needs met quickly. However, as the local East India Company agents explained, Anson could not approach the government directly but

should, like them, work through merchants of the major Chinese trading houses. When this method failed to produce quick results, Anson tried to contact the local viceroy, becoming more vocal and threatening in his demands as his frustration grew. Since the success and even continuance of their trade depended on maintaining good relations with local officials and merchants, the East India Company agents were as anxious as Anson to expedite his departure from China. They were greatly relieved when the refitted and restocked *Centurion* finally left Macao in April 1743.

Rather than sail west, however, Anson made for the Philippines where, off Cape Espiritu Santo, he captured the rich Spanish trade galleon *Neustra Señora de Covadonga* on June 20. Having sustained battle damage and burdened with many prisoners, Anson had no choice but to return to Macao. Upon arrival, he found his position even more precarious than it had been previously. Besides daring to wage war in Chinese waters, he had also disrupted commerce by capturing the ship that was the basis for Chinese trade with the Philippines. His return also reopened the vexed question of harbor dues, which the Chinese, considering all foreigners inferior, demanded of all European vessels. During his earlier visit, Anson had reluctantly anchored at Taipa, 6 miles (10 kilometers) from Macao, to avoid such demands. Since warships were exempt from such dues by European custom, he believed that paying the Chinese duties was dishonorable. Determined to avoid the frustrations of his previous visit, Anson engaged a Chinese pilot in Macao to guide him upriver to Canton. Threatening the pilot with hanging if he grounded the ship, Anson ignored his lack of permission to enter the river, refused to pay any harbor dues, and brought the *Centurion* and its prize to anchorage near the Chinese forts that guarded the river.

After a two-week delay in mid-July, the Chinese finally permitted Anson to land his prisoners and proceed upriver to a new anchorage about 4 miles (6.5 kilometers) outside the roadstead at Whampoa, where East India Company ships docked. By remaining outside the roadstead, Anson maintained his distance from Chinese customs officials, whose demands for harbor dues were again refused. The Chinese

THE CANTON SYSTEM

Because all European trade with China was limited to the port of Canton, the highly restrictive trade regulation established by the Chinese emperor in 1760 was known as the Canton System. The system allowed the Chinese government to control trade with the West and to limit Western contact with and influence on Chinese society.

Under the system, which was overseen by the superintendent of maritime customs, known as the Hoppo, foreigners could come to Canton only during the winter trading season and then were confined to 13 trading factories along the waterfront. They could not enter the walls of Canton itself, and at the end of each trading season they had to return to Macao. They could trade only with a group of 10 to 12 Chinese merchants, who were members of the *gonghang*, the officially authorized trading houses. Direct trade with any other Chinese merchants was strictly prohibited, as was any direct contact with Chinese officials. All European approaches to the Chinese government had to come through the *gonghang* merchants, who in return for their licensed trade monopoly were held fully accountable for the activities and behavior of the Europeans.

—John A. Wagner

merchants provided Anson with daily provisions but not with the large stock of supplies needed for the voyage home, and the next four months were consumed by torturous negotiations with Chinese officials, from whom Anson demanded supplies and a meeting with the local viceroy. The supplies were collected by late November, but the meeting did not occur until Anson's men won a measure of goodwill by helping put out a large fire in Canton. On November 30, eight of Anson's men carried him to the palace in a sedan chair. Forced to wait in an anteroom, Anson was finally admitted to the viceroy's presence, where he complained at length regarding his treatment. When this recital brought no reply, a perplexed Anson mentioned his men's assistance with the fire, which was acknowledged. The viceroy then ordered that the gathered supplies be loaded and wished Anson a good journey home. No mention was made of harbor dues. Much to the

relief of East India Company officials, the *Centurion* departed Canton in early December.

Anson reached England in June 1744 and published the account of his voyage in 1748. Its most shocking passages were those criticizing the Chinese government and society. Anson's remarks shattered the prevailing view of China as a land free of superstition and bigotry and initiated a growing British contempt for China that significantly affected Anglo-Chinese relations in the nineteenth century.

Pocahontas Stories— Mythologies of Friendship and Affiliation

Pocahontas, the legendary Native American girl, saved the life of Englishman John Smith, who faced execution by her father, a powerful seventeenth-century Algonquian chief. Her legendary staying of his execution, conversion to Christianity, and marriage to an Englishman named John Rolfe enabled successive generations to reinterpret her narrative within the context of changing American ideals.

Born in the mid-1590s, Pocahontas was the daughter of Chief Powhatan, who in the 1570s had united diverse Algonquian bands into a loose confederation. During the sixteenth century, Spanish and English traders and explorers

▶ JOHN SMITH

John Smith was born into a family of farmers in Willoughby, England, in 1580. He was short (5 feet 3–4 inches or about 1.6 meters tall) and stocky, with brown hair and a beard. In his late teens, Smith headed to the European continent to fight under the Dutch captain Joseph Duxbury. This began Smith's military career, which enabled him to rise above his lowly family status. Then, in his early twenties, he joined Austrian forces fighting the Turkish Ottoman empire. In 1602 Smith was captured and sold into slavery. After he escaped and returned to friendly territory, the Virginia Company hired Smith to serve as a captain for its American colony. During his two years in the Chesapeake, Smith learned the Algonquian language and developed a relationship with the Powhatan Indian people. Moreover, from 1608 to 1609 Smith served as president of Jamestown. After returning to England, he wrote a series of books about New England, seamanship, and English colonization. Each work reflected his passion for English settlement in the New World. However, his most famous work was the 1624 *Generall Historie of Virginia*, which recounted his experiences with the Powhatans and Pocahontas. In 1631 John Smith died a bachelor, leaving no descendents.

—Kassi Klinefelter

traveled to the southeastern region of the North American continent inhabited by the Powhatans. In June 1607, newcomers established Jamestown, named after the English king, and called the land “Virginia” after the virgin queen, Elizabeth I. For the next six months, Pocahontas interacted with the English settlers. Through a system of trading frequently carried on by females, she learned the language and about English culture.

Over the next half-year, however, conflict and tensions increased between the newcomers eager to expand and the indigenous Powhatans. In an effort to protect his tribe from encroachment and seeking retribution for the murder of two Powhatans, Chief Powhatan captured John Smith. According to the English captain's own published narrative, he was about to be clubbed to death when eleven- or twelve-year-old Pocahontas forcefully intervened.

For the next six years, Pocahontas served as a translator between the English and Algonquian peoples, who otherwise lived in uneasy proximity. By 1613, however, tensions erupted between the Jamestown settlers and the Powhatans. Pocahontas was captured by the Virginians, who held her captive in an attempt to improve their bargaining position with her father. Incarcerated for months, Pocahontas re-created herself as a Christian woman and changed her name to Rebecca. Just days after her release in April 1614, she married John Rolfe, an English tobacco planter she had known during her captivity.

In June 1616 she traveled to London for seven months with her husband and son, where she was honored and feted and known as Lady Rebecca. The former Indian princess now impressed all as a proper Christian woman with a strong command of the English language and customs. However, Pocahontas, who became ill with

pneumonia or tuberculosis while living in London, died on board the ship while it was still on the River Thames, and she was buried in England.

Much of what we know about Pocahontas derives from Smith's own *Generall Historie of Virginie* (1624). But historians and other scholars in various disciplines have cast doubt upon the veracity of Smith's published recollection. Was it fact or fiction? Is it possible that Smith misunderstood the nature of the stay of execution that is at the center of the Pocahontas story? Research on Iroquoian women (also Algonquian) reveals that stopping executions was one way in which Native American women exercised their political power. Another method was the right to call for an "adoption." The Algonquians achieved retribution for a slain family member (and inadvertently added to their population) through an adoption process. It was often women who called for adoptions that led to raids. A recent anthropological interpretation maintains that Smith possibly misunderstood the nature of Pocahontas's actions, casting it in romantic rather than demographic terms. Her real intention was, perhaps, to adopt Smith into the tribe.

The "new" social history of Native American women further reveals, as scholar Jane Kamensky has argued, that "a Pocahontas-like figure [was] at the center of virtually every major encounter between natives and Europeans from the fifteenth century through the nineteenth." Other Native American women elsewhere also served as translators, emissaries, and guides to Euro-American men they occasionally married. However, scholars of Scottish ballads have demonstrated that even before 1300, narrative tales of the oral tradition are remarkably similar to the Pocahontas story. For example, in "Lord Bateman and the Turkish King's Daughter," the American version of "Young Beichan," a man is captured by a ruler and then rescued by his daughter (who converts to Christianity). It would seem, then, that Smith's story was informed by traditional literary conventions with which Europeans were already familiar.

Because Smith's story drew upon older European traditions, it was easily adapted by the British to express their concerns about colonization and by successive generations as well. The centuries-old icon of the preadolescent Native

American girl has reflected concerns and shaped perceptions about a wide variety of issues: race, gender, class, sexuality, liberty, culture, and national identity. Pocahontas has been the subject of paintings, poems, plays, and prints that romanticize our past and contribute to a historical mythology. Whether as exotic and sexual or maternal or virginal, powerful iconographic metaphors of the Native American princess (in contrast to the degraded dark-skinned "squaw") have been used widely, even to sell products such as tobacco, perfume, cigars, and flour.

Just as she reinvented herself in her lifetime, Pocahontas has symbolized nobility, Christianity, Otherness, femininity, and most recently, Disney's view of bourgeois feminism. In this postfeminist animated movie version, Pocahontas is not only physically precocious but is also superhuman. Though she was only about eleven or twelve years of age when she "saved" John Smith, Disney's Pocahontas is a towering titan with Barbie-doll proportions. Pocahontas also has the same romantic devotion that Barbie has to Ken. To heighten the devotion (and simplify the plot), the animated Pocahontas falls in love with John Smith and not John Rolfe, the Englishman she, in fact, did marry. Typically, the movie tied into a consumer market of Pocahontas clothing, accessories, toys, and books, making shoppers out of little girls who can imagine themselves as gorgeous, independent, courageous, and deeply romantic. Disney's historically inaccurate version of Pocahontas offended many Native Americans.

Smallpox Diplomacy—Sir Jeffrey Amherst and Pontiac's Rebellion

The British victory over the French in the Seven Years' War (1754–1763), also known as the French and Indian War, eliminated the French from eastern North America. Those Native American tribes that had been allied with the French were concerned about this development. French relations with Native Americans had been relatively benign, with gifts and mutual benefits. The British had a reputation for being less accepting of Native American culture and traditions.

In 1760 British forces occupied Fort Detroit, the key to British control over the western Great Lakes region. At a conference on September 9, 1761, at Detroit, the British refused Indian requests for cheaper trade goods and ammunition. By 1763 most Indians believed that war was inevitable. The French practice of giving chiefs presents such as guns, knives, and clothing that they could then redistribute to their followers was abandoned. The number of guns and supplies of gunpowder available to the Indians was strictly limited, reducing their ability to hunt. Many Native Americans feared that they were being disarmed by the British. That view was reinforced by British occupation of French forts, such as Fort Detroit. The growing British military presence was believed to be a prelude to conquest. Even more disturbing was a flood of British American settlers from the coastal colonies. The white settlers claimed land used by the Indians for hunting purposes. An Indian spiritual leader known as the Prophet traveled through the region preaching that Native Americans should return to their traditional ways. The Prophet called for Indians to renounce the use of alcohol and European goods such as firearms and iron pots and knives. They should return to the state in which they had lived before Europeans came. The Master of Life would then reward the Native Americans. Most Native Americans in the region accepted the concept, including Pontiac, an Ottawa chief. At a conference that Pontiac held on the Ecorse River near Detroit, Indian leaders agreed to follow him in a war against the British.

Sir Jeffrey Amherst, commander in chief of British forces in North America, made relations

Ottawa chief Pontiac negotiates with English colonel Henry Bouquet at a council fire near the English camp on the Muskingum River in October 1764. (Library of Congress)

more difficult. Amherst had engineered the defeat of French forces in the war and had only contempt for Native Americans. He rejected traditional gift giving despite the advice of advisers with much experience on the frontier.

Pontiac recognized that Detroit was the key to the region. He arranged a surprise attack on the fort on May 7, 1763. The commander, Major Henry Gladwin, was suspicious and had the garrison armed and alert. Although Pontiac canceled the attack, some of his men attacked local settlers. When Gladwin refused to surrender on May 10, Pontiac placed Detroit under siege. In coordinated attacks, Native American tribes took all other British outposts in present-day Michigan, Indiana, and Ohio. Fort Pitt was unsuccessfully attacked on May 28 and subsequently placed under siege.

Amherst was furious that the Indians dared to revolt. When small outposts in Pennsylvania were overrun, he hurriedly arranged for reinforcements. In June, Colonel Henry Bouquet led 400 regulars toward Fort Pitt. In correspondence with Bouquet, Amherst suggested that blankets contaminated with smallpox be distributed to the Indians in hopes of causing an epidemic. He hoped to wipe out the people he called “vermin.” Smallpox had broken out among the garrisons in Fort Pitt. The commander had used a parley with the besieging Indians to distribute to

them handkerchiefs and blankets used by smallpox patients. Historians have debated whether infection through these means was possible, but smallpox did break out among the besiegers. Even so, Amherst apparently never pursued the smallpox idea. His letters to Bouquet also suggested using the so-called Spanish method to exterminate the Native Americans. This method included using hunting dogs, light infantrymen, and men on horseback to hunt the Native Americans like animals, with little danger to the British. Bouquet discouraged this plan because of a lack of hunting dogs.

Bouquet successfully relieved Fort Pitt on August 6. In a two-day battle known as the Battle of Bushy Run, Bouquet lost 50 men, and another 60 were wounded. His men were not able to pursue the Native Americans any farther. Fort Detroit had received 260 regulars as reinforcements on July 28. They sallied out to try to drive off the Indians but were ambushed by Pontiac and his men. The British suffered more than 150 casualties before retreating back inside the fort. The siege was finally broken in September when the schooner *Huron* arrived at Detroit after beating off an Ottawa war party in canoes.

Pontiac recognized that his war, despite its early successes, could not drive the British away. Because the British controlled the water routes to Detroit, the fort could hold out indefinitely. On October 15, 1763, he agreed to a truce and lifted the siege. It was the longest siege ever

undertaken by Native Americans against European forces. When Pontiac tried to resume the fighting in the spring of 1764, his allies refused. Sir William Johnson, the British official in charge of relations with the Native Americans, convinced Amherst to approve gifts and concessions to the Indians. Relations between the British authorities and Native Americans improved greatly. The revolt had other results as well. On October 7, 1763, King George III issued the Proclamation of 1763 forbidding settlement by Europeans west of the Appalachian Mountains, thus providing the Native Americans a breathing space. The revolt also helped bring on the American Revolution because it caused the British government to consider taxing American colonists to help pay for British soldiers to defend the frontier.

■ Introduction: A Military Revolution or Evolution?

The term “Military Revolution” was coined by prominent military historian Michael Roberts in a 1956 essay. In it Roberts argued that the nature of warfare changed profoundly in the period between 1560 and 1660 and marked a turning point in virtually all aspects of war. Army organization, strategies, tactics, and weapons went through major transformations as a result of the innovations of various European military leaders, notably Maurice of Nassau in Holland and Gustavus Adol-

phus in Sweden. The concept of the Military Revolution was widely accepted for two decades until an academic debate around it emerged in the 1980s. British historian Geoffrey Parker expanded the concept to cover changes in fortress designs and naval innovations and stressed the worldwide implications linking the Military Revolution to the rise of Europe to global dominance. Scholars questioned whether a process lasting for over 100 years can be truly called a revolution. Instead, American historian Clifford

J. Rogers suggested the idea of successive military revolutions at different periods, for example, the “infantry revolution” of the fourteenth century, the “artillery revolution” in the fifteenth century, the “fortifications revolution” in the sixteenth, etc. He compared this process to a biological concept of “punctuated equilibrium evolution” that implies short spurts of rapid military innovation followed by longer periods of relative stagnation. Other historians noted that the Military Revolution was not necessarily a purely European phenomenon and that military transformation occurred outside Europe as well, such as in the Ottoman empire, in India, and in Qing China. More importantly, scholars contend that Military Revolution is not just about transformation of tactics and strategies but is also about profound political, economic, and social changes that occurred between the fifteenth and eighteenth centuries. Did the Military Revolution cause these changes in state formation, or did political and social changes contribute to the Military Revolution? The debate is ongoing, and no clear consensus has emerged so far among historians.

—Alexander Mikaberidze

European Military Transformations

Developments in military technology and advances in battlefield tactics from the sixteenth to the eighteenth century in Europe led to what historians refer to as the “military revolution,” which changed not only the nature of warfare itself but also diplomacy and statecraft. In 1955 historian Michael Roberts proposed that four major changes in warfare, occurring from 1560 to 1660, constituted a military revolution: the use of firepower replaced shock, the size of armies was increased, field strategies replaced sieges in offensive operations, and warfare affected civilian societies directly on a vaster scale. Roberts further suggested that these developments allowed for the establishments of constitutional centralization of states (using Protestant Sweden under Gustavus Adolphus as an example) and in effect were a major contributing factor in the evolution of the modern state. However, the historiographical debate that Roberts sparked

allowed for other historians to explore developments in military and state transformations in early modern Europe, which contributed to European hegemony in the world in later centuries.

Historian Geoffrey Parker, while in agreement with Roberts’s overall concept of a military revolution taking place, disagreed with his contention regarding the development of constitutional modern states. Parker also believed that Roberts overlooked developments in France and Spain. Roberts had argued that the state had been required to centralize its authority to administer and tax the populace in order to field and supply standing armies. Parker countered this contention by arguing for the Spanish Habsburg regime, which had not implemented political changes and was still able to maintain and field major forces throughout Europe, most notably the formidable *tercios*. Moreover, according to Parker, the Spanish had been the first in the fifteenth century to create a centralized bureaucratic structure to finance, train, and command its military forces without structural constitutional changes to the Habsburg composite state.

Parker also proposed that Roberts’s argument concerning the transition from siege warfare contributing to developments in tactics on the battlefield was not causally linked from the former to the latter. According to Roberts, modern warfare developed in response to the disuse of fortifications, which were less efficient due to vulnerability from artillery barrages. Parker was critical of this thesis and argued that improvements in fortifications actually contributed to the increase in field troops and the use of artillery. The development of the *trace italienne* in early modern military geography, where low walls, obstacles, and bastions allowed fortress artillery to defend itself from attacking forces, became an important innovation. These new fortifications forced military organizations to field larger armies to attack and maintain larger sieges. Garrisons and defensive forces were also forced to grow in size to match the increase in troops mustered by offensive military commands. Therefore, according to Parker, the revolution occurred nearly a century (1570) before Roberts had suggested (1660).

Historian Jeremy Black argued that the military revolution had actually occurred much later

► SPANISH *TERCIOS*

The Spanish *tercios* (“third”), a military formation composed of pikemen, swordsmen, and harquebusers (musketeers) of 3,000 troops, was a formidable force in early modern European warfare. This infantry formation developed in the Italian Wars (1494–1559) as a response to counter cavalry forces. Pikemen, a Swiss development in infantry, staved off cavalry forces with large spears, or pikes, protecting swordsmen and musketeers within the formation. The Spanish Habsburgs used *tercios* in their many wars of the sixteenth century, exhibiting the combination of the pikeman (defense against cavalry) and the musketeer (firepower) in battle, the old and the new, illustrative of the dynamic nature of the military revolution of early modern Europe. Moreover, fielding these large forces required the Habsburg state to create a viable system of taxation, supply, and military organization, also exhibiting the development of the absolutist state (at least with the composite state of Castile) vis-à-vis the military revolution. However, tactical improvements in the seventeenth century, by the military innovations of the Swede Gustavus Adolphus in the Thirty Years’ War and the Dutch Maurice of Nassau in the Habsburg-Dutch War, reduced the effectiveness of the *tercios* in battle, illustrating the evolution of long-term military transformations vis-à-vis tactics, technology, and the state.

—Abraham O. Mendoza

than proposed by both Roberts and Parker. For Black, the implementation of the ring bayonet, which meant the end of the use of pikemen, allowed for a vast increase in the number of infantry. Pikemen had been used in early modern Europe to protect the infantry from cavalry through the use of large pikes, in effect creating a wall around the columns of musketeers. The ring bayonet allowed armies to dispense with pikes and thus use their manpower for more musketeers in their infantries. Moreover, Black contended that standardization in weaponry and uniforms also contributed to the onset of the military revolution. He proposed, in contrast to Roberts’s thesis, that the modern state, in its administrative and bureaucratic capacities, allowed for strategic developments rather than vice versa.

Historian Clifford Rogers takes an entirely different framework to explain the military transformations in Europe by examining developments before those espoused by Roberts, Parker, and Black. Rogers discusses developments in preceding centuries and formulates these changes by discussing the “infantry revolution” and the “artillery revolution.” According to Rogers, the infantry revolution occurred in the thirteenth century during the Hundred Years’ War (1337–1453) between England and France, where the use of the longbow illustrated the value of the infantry as an integral component in battle against heavily armored knights. Moreover, pikes were also used to fend off cavalry attacks and thus conclusively began being used in larger numbers to counter traditional medieval knight cavalry charges. The need for larger infantries forced states to recruit and maintain troops of nonelites as these became integral components in national armies. Moreover, the artillery revolution, which also grew out of the Hundred Years’ War, was characterized by technological improvements in cannon barrels and more efficient use of gunpowder and contributed to changes in battlefield tactics, sieges, and the development of the state. They became pivotal to destroying strongholds and fortifications and could only be afforded by centralized states due to their expense. Therefore, according to Rogers, these developments, while antecedents to Roberts’s military revolution, illustrate the long-term process of the development of the modern state and changes in military technology and tactics in what he frames as a punctuated equilibrium evolution. In using this model, Rogers proposes that there was a series of military revolutions, all in reaction to previous disequilibrium introduced by prior revolutions and all part of a long-term process of transformation.

The Rise of European Naval Power

Before the sixteenth century, most violence at sea was employed by private individuals to further their own commercial interests. Permanent warship squadrons were few and small, and when monarchs ordered fleets to sea, they generally were composed of ships and crews acquired on a temporary basis by ship musters or requisitioning. From the 1500s on, there was a fundamental shift in Europe from private, commercial naval warfare to public, political warfare in which the nation-state came to monopolize the use of violence at sea. This change resulted from both technological advances in shipbuilding and weaponry and an array of bureaucratic reforms, mutually reinforcing developments that enabled governments to increase their revenues, enlarge their fleets, and thereby channel trade in ways beneficial to the state.

A material essential to Europe's overseas expansion was the adoption of a rig that combined the square sail of northern ships with the fore-and-aft lateen sail of the Mediterranean to create the earliest square-rigged ships. Armed with even light caliber guns, the Portuguese *caravela de armada*—the first European sailing ship developed as a warship—overpowered anything encountered in Asian waters. Yet the square rig was initially incompatible with the heavier guns being developed at the same time. In the 1470s, the Venetians began mounting large centerline guns in their galleys, which had long been overshadowed by the high freeboard of carracks and cogs. Galleys became the naval ship par excellence, not only in the Mediterranean, where sailing warships all but disappeared, but also in northern European waters. With their heaviest guns mounted high in the stern, square-riggers were easily outmaneuvered by galleys whose guns could penetrate enemy ships at or near the waterline with impunity.

Naval gunnery did not begin to mature until the development of the square-rigged galleon, whose low forecastles could accommodate heavy guns forward. The invention of the watertight gun port also allowed guns to be mounted nearer the waterline, and in time the placement of heavy guns amidships created the broadside battery standard from the seventeenth to nineteenth centuries. This in turn gave rise to the adoption of tactics centered on ships of the line. Naval warfare in Europe passed a watershed between 1571, the date of the last major sea battle fought between fleets of galleys, at Lepanto, and 1588, when the English navy checked the Spanish Armada in a week-long contest that was the first in which large numbers of square-rigged ships took part.

Even as naval guns and gunnery improved, boarding actions remained a mainstay of sea fighting. The artillery mounted on wooden ships was well-suited to reducing an opposing ship's effectiveness as a fighting or sailing unit and to killing people, but most ship losses were due to accidents, to which battle damage often contributed. In the Armada, only four Spanish ships (11 percent of confirmed losses) were captured or destroyed outright by English gunnery, three of them after they had run aground or been abandoned. These figures are comparable to statistics for the Royal Navy from the First Anglo-Dutch War (1652–1654) through the end of the Napoleonic Wars in 1815. In the course of ten major naval wars, the British lost 1,452 ships, only 14 percent to enemy action. More than half were lost in accidents, and captures accounted for a third. During World War II, by contrast, more than 80 percent of the 1,700 surface warships lost by all combatants sank as the result of enemy action.

The line of battle became a standard tactic for fleet engagements, as it allowed a heavy concentration of broadside fire on a specific part of the enemy's line. The preferred maneuver was "crossing the T," so that one's broadsides raked the enemy ships from stem to stern while the enemy could respond with only a handful of guns mounted in the bows. In their heyday, the largest ships of the line (first rates) had three full gun decks and mounted 100 or more guns, although the backbone of the battle fleet was the

➤ A SYSTEM OF RATES

The enormous increase in the number of ships in the French and English navies of the late seventeenth century would have been impossible without a concomitant improvement in fleet administration, which became more bureaucratized and systematic. This is most evident in the establishment by Samuel Pepys, clerk of the Navy Board, of a standard system for rating warships on the basis of the number and size of guns carried. N. A. M. Rodger has described this as a bureaucratic acknowledgment that the line of battle had been established as part of British strategy. This establishment determined officers' pay, overall manning requirements (a fixed number of men being required for each gun), and provisioning. Changes were made from time to time, but the rating system was remarkably static. In 1779 the Royal Navy's establishment was:

Rate	Guns	Men
First rate	100–120	850–875
Second rate	90–98	700–750
Third rate	64–80	500–650
Fourth rate	50–60	320–420
Fifth rate	32–44	200–300
Sixth rate	20–28	140–200

Ships of 60 guns and above were considered fit to lie in the battle line and referred to simply as vessels “of the line.” First-rate ships had three full gun decks (hence the expression “first rate” to describe something of the highest quality), but the backbone of the battle fleet was the two-decker of 60 to 90 guns.

—Lincoln P. Paine

two-decker of 60 to 90 guns. Other ship types included the frigate (later classified as fourth- or fifth-rate ships), a lighter, faster ship designed for raiding and dispatches, and a host of smaller types including heavily built bomb vessels that mounted mortars for shore bombardment. The sailing warship reached its acme during the French Revolutionary and Napoleonic wars (1793–1815), although ship design continued to improve in the decades of peace that followed.

However the emergence of completely new and distinct technologies in the 1800s rendered the sailing warship obsolete by mid-century.

Fighting was only one aspect of navies' missions. The increased size of individual fleets reflected the expansion of imperial commitments and a broader range of assignments. Strategy became ever more complex, involving convoy protection, extended blockades, commerce warfare, scouting, patrols in remote corners of empire, and diplomatic missions, much of this work being assigned to frigates.

The steady growth in the numbers of ships and the size of their armaments could not have happened without the development of government bureaucracies to administer the acquisition, repair and provisioning of ships, shipyards and bases, the development and stockpiling of weapons, and the recruitment and retention of officers and crew. Details of naval administration in the early modern period are sketchy, but these institutions were adequate for the purpose. The Portuguese fleet operated from bases strung from Brazil to India and East Asia, while the Spanish fleet had squadrons in Spain, for transatlantic convoy service, and in the Spanish Netherlands. The Ottomans maintained fleets and shipyards at Istanbul and Gallipoli, on the Black Sea, the Danube and Sava Rivers, and in the Aegean, Egypt and Yemen. In the 1520s, Sweden's Gustav I dissolved the monasteries (a year before his Danish counterpart and nearly a decade before England's Henry VIII did so) and built his kingdom's first permanent fleet from the proceeds. From 1597 to 1785, the Dutch Navy comprised five autonomous admiralties paid for by taxes on merchants collected by the admiralties and wartime supplements voted by the States General. The French Navy had a similar admiralty system until the seventeenth century, when finance minister Jean-Baptiste Colbert imposed more centralized control and founded schools of gunnery and navigation. When Peter the Great (1682–1725) created the Russian navy from scratch, he likewise established the Moscow School of Mathematics and Navigation and the St. Petersburg Naval Academy.

Yet the pinnacle of sea power was attained in Great Britain, which adopted a more

empirical approach to naval affairs, issuing *Fighting Instructions* that built upon the experience of actual battle and transmitted lessons learned to be used in future actions. Britain's naval administration combined centralized authority with functional specialties and distinct offices to oversee operations (the Admiralty), finances, shipbuilding and design, and recruitment of crews (the Navy Board), provisions (the Victualling Board), and armaments (the Board of Ordnance).

Apart from the technological changes, the most distinctive feature of naval warfare between the sixteenth and eighteenth centuries is the degree to which European states excelled at it. The primary challenge to European warships operating in Asia, the Americas and home waters was other Europeans. Before the end of the 1500s, the exercise of naval power in the interests of the state beyond the European Atlantic was limited, and Portugal and Spain tended their respective spheres of influence all but unchallenged in Asia and the Americas. Not until the Second Hundred Years' War between England and France did state fleets regularly fight each other in the Americas and Asia. Between England's Glorious Revolution of 1688 and the end of the Napoleonic Wars, England and France and their respective allies were at war more than sixty years and fought about forty major fleet engagements, only two of them in the waters of the British Isles, North Sea, or English Channel. The proximate causes of the individual conflicts differed, but common to all was the aim of preventing any one power—Britain, France or Spain—from dominating European affairs. The wars had enormous consequences beyond Europe, chief among them being the emergence of Great Britain as the first truly global power.

While European fleets were dominant, they were not completely unchallenged. Safavid Persia seized the island of Hormuz from the Portuguese with English help and the Omanis not only expelled them from their territory, but between 1652 and 1665 fought the Portuguese in East Africa, where they captured the port of Mombasa, and in India. The Omani fleet consisted of captured Portuguese ships and purchases from the English and the Dutch, but from the early years

THE TURTLE SHIP

The Japanese invasion of Korea in 1592–1598 faltered when Admiral Yi Sun-sin repeatedly prevented the Japanese from supplying their front lines by sea through a combination of a sophisticated and aggressive strategy, tactical discipline, and a fleet of perhaps five turtle ships (*geobukseon*), two-masted, oared galleys sheathed in iron and covered with spikes to prevent boarding. The turtle ship proved something of a dead-end in ship design, and Japan, Korea, and China remained relatively untouched by developments in naval warfare until the mid-nineteenth century.

—Lincoln P. Paine

of the Estado da India, a majority of the crews on European ships in the Indian Ocean were non-Europeans, so manning their fleet was never a challenge.

Military Transformation in Eurasia

Eurasian military transformations during the period 1450–1770 can be characterized by two themes and one technology. The first theme is the incorporation of nomadic steppe cavalry into many of the armies of the great Eurasian land empires. The synthesis of cavalry with sedentary infantry and artillery created some of the most dynamic and powerful military systems of the age but also led by the end of this period to the containment and finally the suppression of steppe nomadic power by sedentary states, reversing a millennium of steppe dominance. The second theme is the rise of navies, almost exclusively in Europe, with global reach and connected to commercial competition across the world's oceanic trade networks. The technology that facilitated both developments (though it caused neither) was gunpowder, especially in the form of cannon.

Settled states, whose economic bases were in agriculture, had long been at a military disadvantage in facing the bow-armed cavalry of the central Asian steppes. But with the decline of the Mongol empire, the last great power whose military strength derived primarily from steppe cavalry disappeared. The deep causes of this shift in power lay mostly in the growing disparity in demographics and resources between the settled societies and the pastoral world. The gradual expansion of the world of agriculture had been going on for almost two millennia but in a process whereby the less numerous but more militarily skilled steppe peoples periodically united and invaded the farming world. By 1500 agrarian expansion alone had begun to even the military balance, as greater resources allowed the construction of systems of fortifications defending the frontiers. When cannon and infantry firearms added expanded firepower to defensive bases, steppe cavalry forces had no real answer.

But gunpowder alone was not decisive, for steppe cavalry were still useful. The Ottomans, Mughals, Safavids, and Manchus all traced their origins to the steppes and deployed steppe-style cavalry while also exploiting the resources of their agrarian-based empires to raise large infantry forces (some, like the Ottoman janissaries, armed with muskets) and artillery trains. Russian alliance with the Cossacks produced a similar result. These synthetic military systems powered imperial expansion against other settled states and into the steppes alike. The taming of the threat from the steppes can be read as a mixed blessing for the great empires surrounding them, however. Steppe powers were not only a threat but also a challenge that stimulated creativity and change. After 1700 none of the great Asian powers faced any real military threat except for the Ottomans on their European frontier and so had no incentive to further change. When a new challenge came from an unexpected direction in the next era of world history, few were prepared for it.

The closing of the steppes also fragmented steppe-based trade routes just as ocean-based trade connections were becoming more prominent. Western Europe, for complex reasons, became the region that exploited and benefited from these expanding maritime connections most and, again for complex reasons, approached this opportunity in a highly militarized way, creating the first true oceangoing navies. A self-perpetuating combination of state and private interests pursued a policy not just of trade but also of colonization, in effect, of Asia's trade networks. Empires based not on vast land conquests but instead on networks of fortified ports emerged, and even the growing British presence in India resulted from the commercial interests of the British East India Company.

Growing European dominance at sea had two main causes. First, they were the first to develop the technological package of full-rigged ships armed with large ship-killing cannon. These ships were furthermore labor-efficient, requiring relatively small crews for large payloads, and strongly constructed and could be produced in different varieties, from multi-purpose armed merchantmen to specialized

warships. More than any development in land warfare, such navies constituted a military revolution in this period. European states and merchant companies used these ships to expand their share of long-distance trade and of local carrying trade within Asia (as well as to colonize the New World). But the other reason for European dominance at sea was that no major Asian state cared to compete. European ships posed no military threat to large Asian states, and the interests and cultural orientation of the ruling elites of Asian powers were focused on land, agriculture, and armies, not navies. Only the Ottomans in the Mediterranean built a powerful navy, and it was of the galley sort that sailing ships eclipsed after the 1580s.

The rise of European naval power was critically important. In addition to connecting the Americas to Eurasia and creating the Columbian Exchange, the rise of European naval power expanded European military influence in the world. By 1770 Britain was arguably the world's second most powerful military power, behind China. But such comparisons are somewhat limited in their usefulness, as it is also true that neither China nor European naval powers could project force around the globe in any significant way that could threaten another major power. Military force remained a regional factor throughout this period. And while European navies outclassed those of any potential rival, the same cannot be said in any clear way about their armies. This brings us to a more careful assessment of the role of gunpowder weaponry.

The consequences of this new mode of naval activity were momentous. It made possible the first truly global age, as the Americas were brought within the Eurasian sphere of activity. The Columbian Exchange of diseases, plants, and animals had huge long-term effects on both the Old World and the New World. This naval activity also, as noted, moved Europeans closer to the center of the world stage. By 1750 Britain was probably the world's second greatest power behind China, with France not far behind. But European power should not be exaggerated: its influence beyond the seas and immediate coastal areas, even in the Americas,

was limited. European navies were far ahead of the rest of the world's navies. Europe's armies, despite significant transformation, still were not ahead of the rest of the world, at least decisively.

Guns facilitated both the decline of steppe cavalry and the rise of European navies. But gunpowder was not a central cause of either trend. Both rested on prior and continuing demographic, economic, and social developments. The use of guns varied greatly depending on the contexts into which they were introduced, and their appearance did not lead to revolutionary changes. The strongest correlation across Eurasia is that effective mass use of guns, especially infantry small arms, corresponded to strong central governments capable of raising and training mass infantry armies. But stronger governments preceded and made possible this use of firearms, not just in Europe but also for the Ottomans and, most crucially, in China and Japan. State formation was not centrally a product of gunpowder technology. This casts doubt on the most common formulations of a so-called military revolution in European land warfare: the revolution happened at sea. European dominance in land warfare was a product of the political, cultural, and technological changes of the nineteenth century. Down through 1770, European land warfare was just one variation on a set of Eurasian military transformations that were centered on the decline of steppe cavalry, the rise of navies, and the interaction of state strength with military force.

European Mercenaries and Renegades

Between the fifteenth and eighteenth centuries, as European sovereigns fought each other in myriad wars both on the continent and abroad, they often chose not to utilize their contentious aristocracies and rebellious populations, having learned the lessons of allowing these groups to accumulate too much power, but rather increasingly relied on the use of foreign mercenaries in the conduct of war. While noted political scientist Niccolò Machiavelli advised against the use of mercenaries in *The Prince* (1532) as “unreliable and dangerous” as they were disloyal and bound only to their master through their pay, they nonetheless formed an integral part of early modern European armed forces. In major engagements of the period, particularly the Eighty Years’ War (1568–1648), the Thirty Years’ War (1618–1648), the English Civil War (1641–1653), and the American Revolutionary War (1775–1783), the use of foreign mercenaries was widespread among the ranks in battle.

During the Hundred Years’ War (1337–1453) of the late Middle Ages, which was a long drawn out engagement between England and France,

the use of the aristocracy prompted many contentious situations as nobles sought to gain power at the expense of the monarch. While this war was ultimately won by the French Bourbons, it did illustrate the risks of relying on the aristocracy, as well as the risks involved with creating huge standing armies composed of the peasantry whose morale was contingent on food and pay. The Duke of Burgundy, a vassal of the French king, for example, had proven to be a more loyal ally of the English. Moreover, new technologies and more efficient tactics in warfare also required the use of specialized professionals, not merely aristocratic officers with chivalric reasons to fight.

In late Renaissance Italy and Spain, various states under leaders who wished not to use their native population bases to conduct warfare had already turned to the use of mercenaries. The assumption was that mercenaries, while expensive, provided a more reliable force to quell rebellion and to engage in warfare against enemies. Greater numbers of freelance soldiers, most notably from the Swiss cantons, offered their services to the highest bidder, often changing sides when the price was right. Highly trained and specialized in new tactics and in the use of new technology, Swiss soldiers were by far the best in Europe. Habsburg Spain, while creating some of the best fighting forces on the continent during this period, the *tercios*, used mercenaries back home as the leaders were suspicious of allowing Spanish soldiers on the peninsula where they could cause trouble.

The Thirty Years’ War, which pitted Bohemia and her Protestant allies against the Habsburgs, was another instance in which both sides resorted to the use of mercenaries to conduct war. Mercenaries were deemed more efficient as soldiers, filling a role that allowed national populations to maintain the conduct of trade and commerce. Rampaging armies of mercenaries swept across central Europe for three decades, raping and pillaging, not to mention changing sides, in the midst of the conflict. Among the most famous generals of these mercenary armies is Albrecht von Wallenstein. Wallenstein served the Habsburg emperor, bringing him several victories against his multiple enemies using his mercenary armies. While thinking of betraying his

➤ EUSTACHE DE LANNOY

Flemish naval commander, Eustache de Lanoy (1715–1777) worked for the Dutch East India Company (Vereenigde Oostindische Compagnie, VOC) in opening up trade in South India. The company sent him to establish a post at Colachel in South India. While ultimately defeated at the Battle of Colachel (1741) by the Travancore forces under the command of Maharaja Marthanda Varma, Lanoy subsequently was allowed to help train the forces of his former enemies. As a commander of Travancore forces as well as a tactical consultant, he was a pivotal element in the defeat of the Dutch forces in the region. Ultimately the Dutch were repulsed by Indian forces from the region. Furthermore, the remaining French and British contingents made alliances with native states to ensure that their own commercial dominion in the region was not ousted like that of the Dutch.

—Abraham O. Mendoza

patron in early 1634 and switching sides, he was assassinated by order of Emperor Ferdinand II.

In the Dutch-English Wars of the seventeenth century and the wars of Louis XVI of France, Irish, Scottish, German, and Swiss mercenaries provided the bulk of their forces. Many of these renegade soldiers had been either evicted from their homes during the Wars of Religions or found the life of a mercenary exciting and lucrative. Many of these mercenaries found themselves fighting against their former antagonists (such as Irish mercenaries fighting for France or the Dutch against England), while some of them held no such antagonism or quarrel and chose to fight for pay alongside or against a former aggressor. The array of wars of the seventeenth century produced increasing large numbers of mercenary armies, well trained and mustered, which moved from war to war in search of pay and booty. The use of mercenaries lasted well into the late eighteenth and early nineteenth century, most notably the British use of Hessian soldiers in the American Revolutionary War and Napoleon Bonaparte's use of Polish regiments in his crack forces.

The Incan Military Response to the Conquistadores

The Incan military response to the Spanish conquistadores and their native Andean allies involved three stages of resistance. The first stage resisted the Spanish after the death of the Inca emperor Atahualpa at Cajamarca and attempted to halt the Spanish advance south to the Inca capital at Cuzco (1532–1534). The second stage encompassed the Inca rebellion and subsequent sieges of Cuzco and Lima (1536). The third and last stage of resistance was on the part of the lingering neo-Inca resistance in holdouts in the strongholds on the eastern slopes of the Andes

(1539–1572). Both before and after the Spanish incursion, Inca administrators mobilized soldiers and porters throughout the empire among both ethnically Inca populations and non-Inca ethnic groups under Cuzco's rule. Unlike Mesoamerica's Aztecs, Inca soldiers rarely gained renown as the fiercest of warriors. Inca armies won battles in large part because they could field and supply the largest armies; by keeping soldiers mobilized the longest they could successfully defeat most highland and coastal enemies. Inca armies proved less successful in extending their power into the jungles to the east, where seminomadic adversaries could simply slip away.

Superior Inca logistics and numbers also quickly proved insufficient to defeat the new invaders. After the first battle following the Spanish ambush and capture of Atahualpa at Cajamarca in 1532, overwhelming the Spanish by sheer numbers proved impossible. At first the Europeans held the Inca emperor hostage, and he ordered his forces not to attack. By the time the Spanish killed the captive Inca emperor, the Spanish had found numerous allies—and supply networks—among the other ethnic groups subordinated to Inca rule and even among Inca opposed to Atahualpa. After Cajamarca, in every battle the Inca defenders fought against the Spanish they fought against a growing number of native Andean rebels that far outnumbered the Spanish. The anti-Atahualpa forces fed, clothed, guided, and otherwise defended the small spearhead of heavily armed and armored European fighters in what quickly became an insurrection against Atahualpa and his royal line (called a *panaqa*). In essence, a civil war had merely been reignited. When the Spanish first marched into the mountains at Atahualpa's request, the emperor was purifying himself at the sacred thermal baths at Cajamarca after having defeated his half brother Huascar in a devastating civil war over imperial succession set off by the death of the last Inca leader, Huayna Capac, in 1527. By capturing and killing the victorious Inca Atahualpa, the Spanish revived and broadened the struggle for power in the Andes.

Atahualpa's generals Chalcuchima, Rumiñahui, and Quisquis attacked and harried the Spanish as they marched south toward Cuzco

➤ INCAN COUNTERTACTICS

Pre-Hispanic Indian peoples and cultures from Mesoamerica to the Andean highlands may have faced insurmountable strategic disadvantages vis-à-vis their Spanish opponents. However, they still developed countermeasures and enjoyed several tactical victories on the battlefield. This was especially true in the Incan heartland.

The Incas understood early that they would need to impede or suppress the Spanish cavalry. Their arsenal of spears, bows and arrows, battle-axes, maces, and boulders and stones could not defeat mounted Spaniards on the open battlefield. Consequently, the Incas aimed to seize favorable terrain or lure the Spaniards into well-prepared defensive positions. Incan warriors vastly outnumbered Spaniards and could match them in hand-to-hand combat.

During the Quitan Campaign (1534 CE) the Inca commander Rumiñavi dug and then camouflaged spiked horse traps. But the Spaniards learned of this, and his ruse did not succeed. Incan forces had better luck when they burned suspension bridges and forced the Spanish cavalry to cross

dangerous rivers, where Indians attacked them from above with spears and boulders.

Manco Inca's 1536 CE counteroffensive produced dramatic results. Within Cuzco, Indians ambushed mounted Spaniards by toppling entire stone walls onto them, burying them in the rubble. And Manco's forces also seized the initiative on the open ground by diverting rivers to flood the plains, thereby impeding the cavalry, and also by employing bolas (throwing weapons) to entangle horses' legs. Such countermeasures forced the Spaniards in future battles to redeploy their infantry to cover the cavalry.

with Spanish reinforcements from Panama and gathered troops from restive ethnic groups, particularly the Huancas and Chachapoyas. When Spanish forces reached the imperial capital and ceremonial center of Cuzco in November 1533, Manco Inca, who opposed Atahualpa's lineage, received Francisco Pizarro and brokered an alliance that allowed Manco's faction to take power. Another powerful noble, Paullu Inca, led an army south to Chile with the Spanish in an unsuccessful bid to subdue the Mapuche. Meanwhile in Cuzco, Manco Inca chafed under Spanish abuses and plundering, and he resolved to call forth his forces to crush them. After escaping Cuzco, Manco Inca returned with a massive army of over 100,000 in May 1536 to lay siege to Cuzco, which was defended by the Spanish, the Cañari, and Inca factions allied with the Spanish. During the siege, Inca soldiers ambushed four expeditions of reinforcements from Lima by trapping them in gorges and killing them with boulders, arrows, stones thrown

by slings, and hand-to-hand combat mainly with clubs. The Cuzco siege ended when Paullu Inca returned with the Spanish from the south. Equally unsuccessful at dislodging the Spanish, the attack in August 1536 by Inca generals on the new Spanish administrative center in Lima failed when the local Andean polities aided the Spanish in routing the highlanders. With these stunning defeats, the Inca rulers ceased to be the main arbiters of power in the Andes. Spanish Andean allies were set aside into positions subordinate to the conquistadores and eventually Crown administrators.

By February 1539 organized Inca military resistance continued only from Vilcabamba and other remote bases of operations on the eastern edge of the former empire. This resistance first served under Manco Inca and was later led by some of his relatives. This remnant of Inca resistance alternated between warfare and diplomacy vis-à-vis the Spanish. Diplomatic negotiations were often brokered by Spanish missionaries.

Like their counterparts to the south in Chile, these neo-Inca “rebels” began to incorporate steel weapons, firearms, cannons, and horses into their arsenals. However, the greatest Inca weapon of all—the ability to command support up and down the Andes—had been lost. Without the Andean peasant population and its resources supporting their efforts, the Inca resistance could not regain control of the empire. The last neo-Inca ruler, Tupac Amaru, was defeated and captured in 1572 by an indigenous and Spanish force sent by the Spanish viceroy Francisco Toledo. Tupac Amaru’s beheading in Cuzco’s main square on September 24 ended the Inca military response to the Spanish invasion.

■ Introduction: Wars of Empire

The Military Revolution in Europe was intimately linked to the process of empire formation. The term “empire” derives from the Latin *imperium*, meaning “absolute authority.” In a political context, this term refers to a geographically extensive state ruled under a single monarch or governing body. In the period from the sixteenth to the eighteenth centuries, the term was applied to types of imperial authority throughout the world. Thus, the Portuguese and the Dutch established trading empires in Africa and Southeast Asia, while the European discovery of the New World proved a catalyst for colonial empires. While those of Spain, England, and France are widely known, other European states also actively participated in this quest for greater territory and authority. The Most Serene Republic, as the Italian city-state Venice was known until 1797, presided over a lucrative trade empire in the eastern Mediterranean. Sweden, nowadays a paragon of the modern democratic state, was one of the great European powers between 1611 and 1718 and controlled a vast territory in northeastern Europe, southern Africa, and North America. Inside Europe itself, states vied with each other for political power, commercial interests, or sheer prestige. Although

there was only one actual empire, that of the Holy Roman Empire, other states effectively rivaled its power, while the Bourbon-led France all but eclipsed the Holy Roman Empire in the seventeenth century. Yet the Swedish decline in the early eighteenth century signaled the rise of the Russian empire. Tsar Peter the Great declared himself an emperor in 1721 upon his victory over Sweden.

Empires existed outside Europe as well. Thus, the Inca state (Tawantinsuyo) was the largest empire in pre-Columbian America and stretched from Peru and Bolivia to southern Chile and Argentina. Territorially smaller but equally powerful was the Aztec empire in central Mexico. In Asia the largest and most powerful empire was that of China, whose emperors styled it as the Zhōngguó or “Middle Kingdom,” meaning in the center of the civilized world. In India the Mughal empire, founded by Babur in the early sixteenth century, became one of the largest and most sophisticated empires in the world, and at its largest extent it controlled virtually the entire Indian subcontinent. In the late seventeenth century the Mughal authority, however, was challenged by the Maratha Confederacy, which greatly expanded under the

rule of the Peshwas, the Brahmin chief ministers, reaching its height by the mid-eighteenth century. In neighboring Iran the Safavid dynasty, which came to power in 1502, restored a strong Iranian state that dominated the Iranian plateau and claimed influence in Afghanistan, central Asia, the Caucasus, and Iraq. Yet the Safavid authority was challenged both in the west, where it bordered the Ottoman empire, the largest and strongest of the Islamic empires, and in the east, where the Afghan tribes occasionally united to establish powerful states (e.g., the Durrani empire). In Africa the empire of Great Fulo flourished in western Africa but was rivaled by the Mali empire. Farther south, the Asante empire stretched from central Ghana to Côte d'Ivoire, and the Oyo empire, established by the Yoruba in Nigeria in the fifteenth century, emerged as one of the wealthiest West African states. In East Africa the sultans of Adal and the emperors of Ethiopia were engaged in a bitter rivalry over power in the Horn of Africa. In central Africa, vast territories in modern-day Angola, Congo, and the Democratic Republic of the Congo were under the rule of the kings of Kongo, who established a sophisticated government hierarchy and an extensive trading network.

The process of empire formation entailed military conflict and conquest, and the era between 1450 and 1750 produced an unprecedented spate of wars around the world. Looking at the seventeenth century alone, one is struck by the fact that only 2 years (1670 and 1682) in an entire century were without a war between the European states. Looking at individual states, we see that between 1618 and 1678 France was at peace for only 11 years, while Spain was at peace for only 3 years! Some of these wars were of regional nature, such as ten Venetian-Ottoman wars (between 1425 and 1718), six Ottoman-Safavid Wars (sixteenth and seventeenth centuries), the Portuguese-Moroccan wars (1458–1471 and 1578), and the Mughal-Safavid wars (1622–1623, 1638, and 1649–1653). These wars also include the numerous campaigns that the Aztec and Inca rulers, African kings, or North American tribal chiefs conducted to expand their territory, gain commercial advantages, etc. China was one of the Great Powers throughout the sixteenth and eighteenth centuries, and

after establishing domestic stability in the seventeenth century and enjoying a thriving economy, China embarked upon a century of imperial expansion that brought it by the mid-eighteenth century to its greatest territorial extent ever.

Other conflicts, however, were of a global nature and spanned vast territories around the globe. Several factors made these wars unique. They were fought primarily between European powers, such as France, Britain, the Netherlands, and Spain. They were usually centered on already extant mercantile empires and colonies and sought to undermine or supplant the enemy commercial interests in a specific region or in specific regions. These wars were often initiated not by governments but instead by the private initiatives of trading companies (e.g., the English East India Company or the Dutch East India Company), although economic, political, and military rivalry between their respective governments further facilitated them. Another characteristic of these global conflicts was unparalleled use of naval power across the globe. Prior to the fifteenth century, Europe was a marginal player in the world, but using its fleets Europe emerged as the dominant naval power around the globe. European naval expeditions undertaken during the Age of Discovery were not simply voyages of discovery. They also secured European ascendancy in maritime trade and led to the establishment of empires. First the Portuguese and then the Spanish followed by the Dutch, the French, and the English used naval power in support of their imperial enterprises. Technological superiority of European ships—a combination of full-rigged strongly built ships that carried large and effective guns—meant that European states could force their way into most regional trade networks, although there were exceptions, such as China and Japan. By the late seventeenth century European states developed the so-called coastal entrepôt empires that linked series of outposts around the globe by sea. Navies thus played a central role in creating, maintaining, and defending such an empire while maintaining control of major sea-lanes—such as between Africa and the Caribbean or between Europe and India via the southern tip of Africa—became an integral part of national interests. Furthermore, maritime activity became quickly linked

to a new political-economic philosophy, mercantilism, that had two basic premises. First, the total volume of world trade was constant, and second, a country should try to obtain a favorable trade pattern (more exports, less imports) so as to amass specie, which could be then used for military or political purposes. Such a mercantilist outlook sustained imperial policies of many European states that sought to grab a bigger slice of a static world economy.

—*Alexander Mikaberidze*

Wars of Nation and Empire— The Second Hundred Years' War

The Second Hundred Years' War is a historical label for a series of military conflicts between the kingdoms of England (Britain after the Act of Union with Scotland in 1707) and France that occurred from approximately 1689 to 1815. Similarly to the First Hundred Years' War (1337–1453), the term “Second Hundred Years' War” does not describe a single military engagement but instead a constant state of war between the two primary belligerents. Historians use the concept of the Second Hundred Years' War to highlight the interrelationships between the imperial wars of this period and to interpret the rivalry between France and Britain for power in Europe and the expansion of global empires abroad. The various wars between the two states during the eighteenth century usually involved other European countries in a series of shifting alliances with the exception of the War of the Quadruple Alliance (1718–1720) in which they fought together against Spain. Many of the wars, such as the Seven Years' War (called the French and Indian War in the British American colonies), are considered global wars and included battles in the colonies in the New World, India, and maritime shipping routes across the world. In addition, the conflict over religion and revolution contributed to the ideologies shaping the relationship between the two Great Powers, especially in regard to the enmity between Catholicism and Protestantism that spanned Europe.

The Second Hundred Years' War began with the accession of the Protestant William III as king of England in the Glorious Revolution of 1688. The series of wars fought between Britain and

France and their allies carried separate names in the Old World and the New World, suggesting a transitional period of global contact: the Nine Years' War, or King William's War (1688–1697); the War of the Spanish Succession, or Queen Anne's War (1702–1713); the War of the Austrian Succession, or King George's War (1742–1748); and the Seven Years' War, or the French and Indian War (1754–1763). Many of these wars overlapped chronologically in Europe and abroad at various points, but they all directly engaged Britain against France militarily. For instance, King George's War merged into the 1739 conflict between Britain and Spain known as the War of Jenkins' Ear, and the French and Indian War was triggered in America's Ohio Valley in 1753.

These wars for legitimacy in Europe and territories and trade routes abroad were complicated by Europe's religious conflicts. The Stuarts (1603–1647) had sought friendly terms with French monarch Louis XIV. Former Stuart kings James I (r. 1603–1625) and Charles I (1625–1647), both Anglicans with Catholic sympathies, had avoided involvement as much as possible in the Thirty Years' War on the continent. They had sought peaceful relations with France throughout the seventeenth century. King William III, however, sought to oppose Louis XIV's Catholic regime and positioned himself as a Protestant advocate against the hegemony of

British vice admiral Edward Vernon leads an attack on the Spanish at Porto Bello (in present-day Panama) on November 21, 1739, during the War of Jenkins' Ear. Painting entitled La Capture du Porto Bello en 1739, by George Chambers. (Corel)

➤ KING WILLIAM'S WAR—COLONIAL WARS DURING THE SECOND HUNDRED YEARS' WAR

Among the many wars between England (Britain after 1707) and France, King William's War (1689–1697) is the first of the colonial wars fought in North America simultaneously with a European war (in this case the War of the Spanish Succession). In this conflagration and others that followed, Britain and France made use of their respective Native American alliances in battle. British anxiety developed over France's friendly relations with the Abnakis, who were allied to the Pennacooks, Penabscots, and Micmacs in New England, and alleged plans to expel the English from North America in order to make it Catholic. Friction ensued. Along with their Iroquois allies, the British began to engage in attacks on French allies that resulted in retaliation. The result was a brutal war of attrition characterized by guerrilla tactics on both sides, with Native American allies doing the brunt of the fighting. While the Treaty of Ryswick (1797) officially ended the fighting, it would not be the last time Britain and France would make use of their Native American alliances to settle their colonial differences. Only after the French withdrawal from North America after defeat in the French and Indian War (1754–1763) would these wars by proxy end.

—Abraham O. Mendoza

Catholicism. Tensions mounted between the two kingdoms in subsequent decades, particularly with France offering protection to Jacobites who sought to overthrow the current English monarch, whether Stuart or Hanoverian. In such instances, both nations sought allies on the continent. The French-Habsburg antagonism in this period was valuable to Britain, providing it with a de facto ally. Following the reign of William III, the conflict between France and Britain shifted from religion to economic expansion abroad. Both states competed for colonial domination in Southeast Asia and the New World, particularly in the Caribbean.

In the late eighteenth century political ideology shaped British and French antagonisms, much in the same way that religion had in previous decades. The French Revolutionary wars of

this period (1793–1802) incorporated the War of the First Coalition (1793–1797) and the War of the Second Coalition (1798–1801) followed by the Napoleonic Wars (1803–1815), which included both the Peninsular War in Spain (1808–1814) and the Hundred Days (1815). British opposition to the French Revolution (1789–1799) and the subsequent wars against the French Republic and then the consulate and empire, both under Napoleon Bonaparte (r. 1799–1815), characterized the continuing antagonism between the two states. Bonaparte's defeat at the Battle of Waterloo in 1815 ended this endemic state of war between France and Britain. During the conflict Britain found common cause with allies in the continent, eager to throw off the French yoke, among them Austria, Prussia, and Russia. Both the French Revolution and Bonaparte presented a threat to British interests and trade on the continent, not to mention a subversive ideology threatening stability at home. Their relationship for the remainder of the nineteenth century involved tense diplomatic engagements but never again resulted in a violent conflagration. Alliance between Britain and France, first in the Crimean War and then in the First World War and the Second World War, illustrated their collusion against other hostile powers to defend their common interests. However, the First Hundred Years' War and the Second Hundred Years' War illustrate the longevity of the hostility between them.

Establishment of Ottomans as Empire

The Ottoman state arose out of the ashes of the Mongol il-khanate in Anatolia. It was one of many *beyliks*, or polities, in the region. By 1326 the Osmons, or Ottomans as Europeans called them, controlled the region surrounding Bursa,

their first capital. Under the dynamic sultan Murad I (r. 1362–1389), the Ottomans crossed into Europe. Swiftly much of northern Greece, Macedonia, and Bulgaria came under their control. Ottoman authority in the Balkans was solidified with their victory at Kosovo in 1389. What is notable about the initial Ottoman invasion of Europe is that it came at the request of the Byzantine empire by a claimant to the Byzantine throne to help him secure power. Although the empire had a setback in 1402 when the central Asian military genius known as Timur-i Leng (Tamerlane) defeated Bayazid I (r. 1389–1402), it recovered and captured Constantinople in 1453 during the second reign of Sultan Mehmed II (r. 1444–1446, 1451–1481).

The city was a far cry from its previous glory but still wielded historical significance. With its capture, the Ottomans now viewed themselves as the inheritors of the Roman empire, thus legitimizing their rule over former Byzantine lands as well as potentially legitimating further conquests. Mehmed, now given the sobriquet of “Conqueror,” fused the Muslim and Christian worlds into a carefully nuanced vision of authority. The Ottomans continued to allow their Christian subjects to practice their religion, although Anatolia increasingly converted to Islam. Mehmed solidified his dominance south of the Danube by subduing Belgrade in 1456 and conquering the last Greek power with the conquest of the Peloponnesus in 1460. Although the legendary Scanderbeg fended off Ottoman encroachments for years, his death in 1468 ensured Mehmed II’s success in subduing Albania. In addition, Mehmed began ridding the islands of the eastern Mediterranean and the Aegean Sea of the Venetians by using lighter and more mobile galleys designed by Spanish and Italian shipwrights. By the time of his death, the Ottomans were the masters of eastern Europe south of the Danube, although a few holdouts remained.

With the rise of the Aq Qoyunlu and the decline of Timurid authority, eastern Anatolia proved to be a hotbed of activity again. Even after the defeat of the Aq Qoyunlu confederacy at Bashkent in 1473, eastern Anatolia remained volatile. As the Ottomans tightened their grip on the region, many Turkic chieftains sought new outlets for their independence. With the rise of

the Safavids in Azerbaijan, some Turkic nomads also turned to Shia Islam. The establishment of a dynamic Shia state in Iran threatened not only Ottoman authority over the tribes in eastern Anatolia but also the sultan’s role as the defender of Sunni orthodoxy.

The Safavids and Ottomans ultimately clashed at Chaldiran in 1514, with the Ottoman janissaries and artillery overcoming the horse-archer army of the Safavids. Although Sultan Selim I (r. 1512–1520) attempted to crush the Safavids once and for all, his army mutinied and forced Selim to cease his expansion into Azerbaijan. Nonetheless, eastern Anatolia was now firmly under Ottoman control. Selim’s territorial aggrandizement did not end. In 1516 he conquered Syria from the Mamluk sultanate and then Egypt in 1517. Eventually the Ottoman possessions would reach the Zagros Mountains that border Iran and Iraq; indeed, the conflict between the Safavids and Ottomans largely defines that border.

Selim’s son, Suleiman (1520–1566), extended the empire to its greatest extent. Suleiman began his reign with the conquest of Belgrade in 1521 and then drove the Hospitallars from their island fortress of Rhodes, where they had been a menace to Ottoman ships for centuries. Although Mehmed II had sparred with Hungary, his incursions did not result in long-term conquests. Under Sultan Suleiman the Ottomans expanded north of the Danube into Hungary. A victory at Mohacs in 1526 gave the Ottomans a dominant position over their former rival, but it also brought them into conflict with the Habsburg dynasty. While the Ottomans failed to take Vienna in 1529, the Ottoman-Habsburg rivalry would continue to the twentieth century in Europe, while the two empires struggled for dominance and influence in North Africa during the sixteenth and seventeenth centuries. Indeed, Ottoman authority stretched as far as Morocco, if only in name and not actual power. In addition, Suleiman seized the Safavid capital of Tabriz and extended Ottoman authority to the Tigris River with the seizure of Baghdad. Finally, the Ottomans became suzerains over the Crimean Tatars and thus were able to extend their influence into the steppes and play a role in Polish and Russian affairs. When Suleiman died in 1566, the Black Sea was a Turkish lake, and Hungary and

➤ CONSTANTINOPLE, 1453

By 1453 the Byzantine Empire consisted only of Constantinople, a few fortresses in the Peloponnese, and several islands. Its territory was completely surrounded by Ottoman holdings. When Mehmed II assumed the throne in 1451, he decided to eliminate the Byzantines. He signed treaties with Venice and Hungary to keep them from sending aid. In 1452 he ordered the construction of Rumeli Hisar on the European side of the Bosphorus to control sea access to Constantinople. When the fortress was finished in July 1452, the Ottomans prepared to besiege the city. One important innovation was the role played by cannon during the siege. With assistance from Christian engineers, the Turks cast heavy cannon to blow breaches in Constantinople's walls. The most massive cannon was 27 feet (8.2 meters) long and 2.5 feet (.76 meters) in diameter. It hurled a stone ball weighing more than 1,300 pounds (590 kilograms).

On April 5, 1453, the Ottoman army of 120,000 was camped outside Constantinople. Emperor Constantine XI Palaeologus had only 7,000 defenders. Firing began the next day. On April 20 four European ships with men and supplies forced their way past the Turkish fleet. Mehmed had some of his ships pulled overland to the Golden Horn, where they were able to sink the relief ships. After unsuccessful attacks on May 7 and May 12, a final

Rumeli Hisar fortress on the Bosphorus in present-day Istanbul, built by Mehmed II in 1452. (Hazlan Abdul Hakim)

Turkish assault began on May 29. The first two attacks were beaten off, but in a third attack the Janissaries forced their way through breaches blown by the cannon. The defenders were slaughtered, and the city was pillaged for three days. Constantinople became the Ottoman capital. The loss was a powerful psychological blow to Western Christianity, as it illustrated the relative strength of the Ottomans in contrast with the apparent weakness of Western Christendom.

—Timothy J. Watts

Moldavia were Ottoman subjects, as were Yemen and Iraq and at least in theory all of North Africa to Morocco.

After Suleiman, the empire ceased to expand with the exception of capturing Cyprus and other Aegean islands. While the Ottomans did suffer setbacks such as Lepanto in 1571 and some defeats to the Safavids, they did not lose significant amounts of territory until 1700, when they could no longer fend off the attacks from Safavid Iran, the Russian empire, Poland, and Habsburg Austria while also dealing with internal feuds and rebellions. Although it is often remarked that the Ottomans declined after the reign of Suleiman, if they did it was an extremely slow decline, as even in the eighteenth century they scored victories against the Russians in 1711 and against Austria in 1739. One reason

why they ceased to expand was the simple fact that they now shared borders with other states (Austria and Russia) that were coming under increasing centralization, which also allowed them to better marshal their resources against the Ottomans. Furthermore, because these states were also expansive, the Ottomans rarely had the luxury of fighting one war at a time. Many of the peace treaties they signed were simply so they could then pay attention to a new threat on a different frontier. Nonetheless, in the early eighteenth century the Ottomans were still a force with which to be reckoned.

Ottoman Expansion into Eastern Europe

Named after their founder, Osman (d. 1324), the Ottomans were just one of many small emirates that emerged in Anatolia after the destruction of the Seljuk state by the Mongols in 1243. The characterization of Osman's followers as *gazis*, or frontier fighters for the faith, has been fiercely debated, in part because they expanded their power at the expense of both the Christian Byzantine empire and other Muslim emirates. Whatever their motivations, and they were most likely manifold, during the reign of Osman's son, Orhan (d. 1362), the Ottomans quickly expanded their domain in both Europe and Asia. After marrying a Byzantine princess in 1346, Orhan sent an army across the Dardanelles to support his father-in-law's bid for the imperial throne. This army was soon followed by settlers and more soldiers. The Ottoman expansion into Europe had begun.

Murad I (r. 1362–1389) continued the Ottoman expansion into what they called Rumeli, taking Adrianople (Edirne), which became his capital, in 1369 and Sofia in 1385. In 1389 Murad died fighting in the Battle of Kosovo Polje, but the Ottomans, now under the command of Murad's son, Bayezid I, won the battle. In 1394 Bayezid laid siege to Constantinople, which got the attention of Western as well as Eastern Christians. A crusade was called, but in 1396 Bayezid crushed this army at the Battle of Nicopolis. Unfortunately for Bayezid though, an even more powerful Turkic empire builder was leading his armies out of central Asia into Ottoman lands. Bayezid's defeat by Timur in 1402 plunged the Ottoman state into a decade of internecine warfare. Under the reign of Mehmed I (r. 1413–1421) and his son Murad II (r. 1421–1451), however, the

Ottomans expanded farther into Europe; into Albania, which gave them access to the Adriatic; and into Hungary, which led to the death of King Władysław III of Poland and Hungary at the Battle of Varna in 1444.

The European expansion continued under Mehmed II (r. 1451–1481), who earned the soubriquet “the Conqueror” for accomplishing what Muslim rulers had been unsuccessfully attempting since the seventh century CE: the conquest of Constantinople (Istanbul). With the acquisition of this new capital, Mehmed institutionalized a new household and bureaucratic structure based upon the institution of slavery and given concrete expression through the building of two new palaces. In the first or “old” palace, he established the imperial harem for the concubines who had replaced the neighboring princesses as the bearers of the sultan's children. The second palace, Topkapi Sarayı, was occupied by the high officers of the state, who during Mehmed's reign began to be Balkan Christian boys collected in the *devshirme* (“gathering”), who were converted to Islam and trained in the palace. Slave soldiers had played an important role in the army as Janissaries (from *yeni cheri*, or “new army”) since the late fourteenth century, but these new *kapikulu*, or “slaves of the Porte,” drawn from southeastern Europe, dominated all aspects of Ottoman governance and helped to strengthen the ties between Rumeli and the Ottoman capital. During Mehmed's reign the frontiers of the Ottoman state were greatly extended, both in the east and the west. He captured Athens in 1458, Serbia in 1459, the Morea in 1460, Bosnia in 1464, and Negroponte (Euboia) in 1470. In 1480 he laid siege to Rhodes. Mehmed also extended Ottoman authority northward across the Black Sea where the Crimea became an Ottoman vassal state, and the Genoese trading colony in Caffa (modern-day Feodosiya, Ukraine) was captured in 1475.

During the reign of Bayezid II (r. 1481–1512), the Ottomans had annexed Hercegovina (1483), invaded Moldavia (1484), and seized Naupaktos (Lepanto) in 1449 and Modon, Coron, and Navarino in 1500. Although Bayezid's successor Selim I (r. 1512–1520) mostly campaigned along the eastern frontiers of the empire, the Ottoman empire reached its apogee during the reign of

➤ OGIER GHISELIN DE BUSBECQ

Diplomat, antiquarian, naturalist, linguist, and sportsman, Ogier Ghiselin de Busbecq (1522–1592) was truly a renaissance man. He is credited with introducing the tulip into Europe and preserving numerous antiquities, including a transcription of the Roman emperor Augustus's *Res Gestae*. Busbecq's greatest contribution, however, was his description of the Ottoman empire during the reign of Suleiman the Magnificent (1520–1566). Ostensibly private correspondence to a friend and fellow diplomat, Busbecq published his *Turkish Letters* in 1589. During the next century this book was translated from Latin into seven languages, including English, and helped to shape European opinions of the Ottomans throughout the early modern era.

Although he constantly referred to the Ottomans as barbarians and lamented both their occupation of Christian countries and their treatment of

antiquities, he did praise their military discipline and prowess. Also, as the illegitimate son of a nobleman, he praised the Ottomans for rewarding merit over birth. He also used the Turks as a foil to lambaste Europeans for certain mores, like dueling, that he found objectionable.

The majority of Busbecq's legation was spent under house arrest, during which time he collected ancient coins and manuscripts as well as plants and animals, which he brought back to Europe. He also collected information about the history and culture of the Ottomans and their neighbors, including a vocabulary of Crimean Gothic. He was joined in his captivity by the Danish artist Melchior Lorck, whose numerous drawings, including a monumental panorama of Constantinople, also had an enduring influence on European conceptions of the Ottomans.

—Paul Millman

Suleiman the Magnificent (r. 1520–1566). In the 1520s Suleiman extended his European dominion to the gates of Vienna. In 1521 he took Belgrade, and in 1526 he annihilated the Hungarian army, including King Louis II, at Mohács, subsequently capturing the capital, Buda. After failing to take Vienna, the capital of the Habsburg empire, in 1529, Suleiman and his successors turned their attention to Persia and the Mediterranean. In the eastern Mediterranean, Suleiman expelled the Hospitallers from the island of Rhodes in 1522. He soon, however, faced a European counterattack. In 1535 Holy Roman Emperor Charles V led a successful campaign against Tunis, and an Ottoman-Venetian war began in 1536. In response, Suleiman established an alliance with Charles's enemy, King Francis I of France, and the Ottoman navy raided Spanish and Italian port towns while wintering in France in 1543. By 1540 Venice lost most of its Aegean islands, while Ottoman campaigns in the Mediterranean in the 1550s led to the siege of Malta (1565) and the capture of Chios (1566).

When the Ottomans once again entered into hostilities with the Habsburgs in the 1590s, it was with limited success. The 1606 treaty

negotiated at Zsitvatorok on the Habsburg-Ottoman borderland established a fixed and peaceful frontier that would last for most of the seventeenth century. Peace with the Habsburgs, however, did not preclude wars of expansion against the other regional powers. In 1645 the Ottomans attacked the Venetian territory of Crete, but this war dragged on for 25 years. This limited success was paralleled in the Ottomans' wars with Poland and Russia in the 1670s. While victorious against Poland in 1676, the very next year the Ottomans were forced to cede their newly acquired territory in western Ukraine to Russia. Despite these setbacks, Grand Vizier Kara Mustafa Koprulu, whose family had been entrusted with the governance of the empire by Sultan Mehmed IV (r. 1648–1687), set his sights on the prize that had escaped Suleiman the Magnificent. Yet this second attempt to conquer Vienna in 1683 proved to be the beginning of the end for the Ottomans. The city was relieved by an army led by the Polish king Jan III Sobieski, and in the ensuing 13 years of warfare the Holy League of Poland-Lithuania, Venice, Austria, and Russia drove the Ottoman frontier back. In the 1699 Treaty of Karlowitz the Ottomans ceded

large portions of their European possessions, including Hungary, to the victorious powers. The Ottoman expansion into Europe had ended.

Austro-Ottoman Rivalry

The Austrian and Ottoman empires had a long history of rivalry and conflict. The Ottoman expansion into Serbia and Hungary in the fifteenth century led to Ottoman raids on Austrian territory and prolonged Austro-Ottoman wars that shaped the history of both empires. The Ottomans initially raided the southern regions of Austria between 1408 and 1426, but subsequent decades saw more serious attacks. Sultan Suleiman I's successful invasion of Hungary, which resulted in the destruction of the Hungarian army at Mohacs in 1526, opened the way for systematic Ottoman attacks on Austrian territory. Furthermore, the Ottoman threat allowed the Habsburgs, the ruling dynasty of Austria, to unite the crowns of Austria, Hungary, and Bohemia. In 1529 Sultan Suleiman launched a major invasion of Austria proper. The Ottoman siege of Vienna (September 27–October 14, 1529) ended after the Ottoman forces compelled Suleiman to withdraw. In the absence of the Ottoman army, the Austrians captured several cities in Hungary. But Suleiman returned in 1532 when he led some 200,000 men from Constantinople at

the end of April. Holy Roman Emperor Charles V mobilized his army and sought support from other European states. Fortunately for the Austrians, the Ottoman army did not reach Vienna because it became bogged down at Güns (Koszeg), where the Austrian garrison heroically defended the fortress for three weeks. Sultan Suleiman showed his great admiration for the enemy's gallantry, inviting the Austrian commandant to his camp, where he was cordially received and awarded a robe of honor, as well as posting guards in the breach in the wall to prevent his troops from entering during the respite.

The dogged defense of Güns convinced Suleiman to give up on besieging Vienna, which was much more fortified. Fearing another Ottoman invasion, the Habsburgs sought to compromise while Suleiman, concerned about the rising Iranian power in the east, was quite willing to negotiate. The Treaty of Constantinople was negotiated in June 1533 and compelled Austria to give up Hungary and pay annual tribute to the Ottoman empire. The treaty survived for seven years, although it was violated on several occasions. When an open conflict erupted in 1540, Suleiman again sought to strengthen his authority in Hungary. The Ottomans defeated the Austrians at Buda and occupied central Hungary. In the Treaty of Gyula (December 29, 1541), Austria and the Ottoman empire agreed to partition Hungary: the Habsburgs received the western and northern regions, the Ottomans received central Hungary, and the eastern regions became the Ottoman client principality of Transylvania. However, hostilities soon resumed. The Austrians attempted to avenge their defeat by seizing Algiers and Tunis, which led to another disastrous failure. In 1543 Suleiman captured all fortresses leading to Buda, including Grau and Stuhlweissenberg, the largest in the area. Distracted by a new war against Safavid Iran in the east, the sultan entrusted the Hungarian theater to his lieutenants, who successfully campaigned in 1544. Hard-pressed, Austrians sued for a peace that confirmed provisions of the Treaty of Gyula.

After the failed Ottoman siege of Malta (1565), the 72-year-old Suleiman turned to Hungary, where he wanted to offset his failure at Malta as well as punish Holy Roman Emperor

Ferdinand I, who refused to pay the tribute. In 1566 the sultan's army invaded southwestern Hungary and besieged Szigetvár, whose Croatian commander Miklos Zrinyi led a valiant defense that destroyed most of the fortress and its garrison but inflicted heavy losses on the Turks. Suleiman died during the siege on September 6, but his death was concealed from the army until the fortress was stormed on September 8. Informed of the sultan's death, the Ottoman army returned to Constantinople (Istanbul) carrying Suleiman's embalmed body for burial.

Twenty-five years after Suleiman's death, the two empires clashed once again. The so-called Long War was caused by intermittent border strife between Austrian and Ottoman Hungary that intensified in 1591. Two years later a Croatian force inflicted a heavy defeat on the Bosnian Ottoman army at Sissek (Sisak), which provoked a war. In 1594–1595, with Pope Clement VIII's help, Austria established an alliance with Transylvania, Moldavia, and Wallachia. In 1595 Austrians reclaimed parts of Hungary, while their Wallachian allies successfully campaigned against the Turks on the Lower Danube. Alarmed by these setbacks, Ottoman sultan Muhammad III came to Hungary to personally lead his troops. In 1596 he snatched victory from the jaws of defeat at Mezokeresztes; with his troops fleeing en masse, Muhammad personally led a desperate charge with his remaining troops and turned the tide of battle. For the next five years the war became a battle of fortresses in which Austria gradually gained key fortresses in central Austria, although its attack on Buda failed in 1598. In 1599 the Austrian peace overtures were rebuffed by the sultan, whose new offensive led to the capture of Kanizsa (1600) and a victory at Buda (1605), which allowed the Ottomans to regain much of the land lost since 1595. The Long War ended with the Treaty of Zsitva-Torok (1606), which marked the first major check of Ottoman expansion and stabilized the Habsburg-Ottoman frontier for half a century.

The peace proved to be lasting, and Austria and the Ottoman empire enjoyed relatively peaceful relations for the next 50 years. Still, a new Austro-Ottoman war broke out in 1663 when Holy Roman Emperor Leopold I (1640–1705), seeking to challenge Ottoman influence, sent his army

under Count Raimondo Montecuccoli into Hungary. In 1663 Grand Vizier Koprulu Fazıl Ahmed led a massive Ottoman army into Habsburg Hungary and, after wintering in Belgrade, seized several Austrian-held fortresses, causing Leopold to begin peace negotiations. While negotiations were under way the Ottoman army marched toward Vienna but was defeated near the Szentgotthárd (St. Gotthard) Abbey north of the Raab River by Montecuccoli's army on August 1, 1664. In spite of the victory, Emperor Leopold, who was aware how weakened the Austrian army was, chose to proceed with negotiations and signed the Treaty of Vasvar. According to its terms, Austrians surrendered a number of border fortresses, recognized Ottoman control of Transylvania, and agreed to pay the sultan an annual "gift" of some 200,000 florins.

The Treaty of Vasvar held for 20 years before it was broken by another war. The so-called Great Turkish War, however, was not limited to Austrian-Ottoman conflict but also involved other European states that united into an anti-Ottoman coalition. Relations between Austria and the Ottoman empire remained tense. Austrian positions in Royal Hungary remained tenuous and faced resistance from the Kuruc movement led by Imre Thököly. In 1682 Thököly recognized Ottoman sovereignty, and an Austrian attempt to subdue him prompted Ottoman response. The Ottoman invasion of Austria in 1683 almost succeeded in capturing Vienna before the Austrian-Polish forces under King John III Sobieski of Poland scored a major victory at Vienna (September 1683) and drove them out of northwestern Hungary. Pope Innocent XI then helped create the Holy League consisting of the Holy Roman Empire, Venice, and Poland (Russia joined in 1686). The Poles conducted campaigns in Moldavia in 1686 and 1691, while Venetians attacked Ottoman interests in Dalmatia, Morea (southern Greece), and the eastern Mediterranean. The Ottomans repelled Russian invasions of the Crimea (an Ottoman vassal) in 1687 and 1689 as well as attacks on the Ottoman fort of Azov in 1695–1696. Yet the fate of the war was decided on the fields of Hungary, where the Ottomans suffered a series of defeats at Gran (Esztergom) and Neuhausel in 1685, Buda in 1686, and Mount Harsan (near Mohacs) in 1687.

By the end of 1687 southern Hungary and much of Transylvania came under Habsburg (Austrian) control, and Austrian operations extended into Serbia, where Habsburg forces celebrated victories at Belgrade in 1688 and Nis in 1689. Sultan Suleiman II's counterattack into Transylvania and Serbia was at first successful and led to the conquest of Belgrade in 1690. Yet the Ottomans then suffered defeats at Slankamen in 1691 and Grosswardein (Oradea) in 1692. Austria then became distracted by the War of the Grand Alliance against France and turned away from the Ottoman front for almost five years. In 1697 as the Ottoman army marched from Belgrade toward Hungary, an Austrian army under Prince Eugene of Savoy routed it at the Battle of Zenta on September 11. This crushing defeat compelled the sultan to accept peace negotiations, which resulted in the Treaty of Karlowitz on January 26, 1699. The Ottoman empire, although retaining Serbia, accepted Austria's control of all of Hungary (except the Banat of Temesvar), Transylvania, Croatia, and Slavonia and recognized Venice's influence in Morea and Dalmatia and Poland's presence in Podolia.

The Treaty of Karlowitz maintained peace between Austria and the Ottoman empire for 15 years. Both empires waged wars on other fronts, however, and Sultan Ahmed III concentrated his efforts on reclaiming lands in Greece, which resulted in the start of the Venetian-Ottoman War in 1714. Austria accused the Turks of breaking the treaty by endangering Venetian interests and made a defensive alliance with Venice in 1716. The Austrian army, led by the brilliant commander Prince Eugene of Savoy, routed the Turks at Peterwardein on the Danube River on August 5, 1716, and captured the Banat of Temesvar, the only remaining Ottoman region in Hungary. The following year Austrians invaded Serbia, defeating the Ottoman army and capturing Belgrade in August 1717. With the Austrians controlling much of Serbia and western Wallachia, the Ottomans sued for peace, confirming Austrian gains in Hungary, Serbia, and Wallachia. Some two decades later after Russia and the Ottoman empire became embroiled in a war, Austria chose to side with Russia and enter the fray, although Austria was not prepared for a war. The Ottoman army inflicted several major defeats upon the

➤ THE SIEGES OF VIENNA

From September 27 to October 14, 1529, Suleiman the Magnificent besieged the city of Vienna in hopes of breaking the power of the Austrian empire and opening the way to central Europe. More than 120,000 Turks repeatedly assaulted the fortifications around the city, defended by 16,000 troops and many civilians under the Count de Salm. A final attempt to storm a breach in the walls was repulsed with heavy losses, and Suleiman withdrew. The Turks soon found themselves fighting multiple wars against Russia, Venice, Persia, Austria, Hungary, and others and were not able to return their attention to Vienna until 1683.

In September 1683, the Turks, riding a resurgence of power, besieged Vienna again with 138,000 troops under Kara Mustapha Pasha. By this time, complex *trace italienne*-style fortifications, developed by the French engineer Sébastien Le Prestre de Vauban, were employed to defend many European cities, including Vienna. Giant Turkish guns, so successful against the old walls of Constantinople in 1453, were no longer very effective. The Turkish siege was poorly conducted, with no defensive breastworks to protect Turkish lines in case of rear attack. That is exactly what happened when King Jan III Sobieski of Poland came to the aid of Vienna with 30,000 troops. He was also given command of 40,000 Austrian troops, and a rear attack on the Turkish line led to a fierce, desperate, daylong battle that found the Turks sandwiched between the fortifications of Vienna and the forces of Sobieski. The Turks were crushed with huge losses, including six pashas. Kara Mustapha Pasha narrowly escaped, and Austria went on to take Belgrade, the Turkish Balkan stronghold, and then marched on Constantinople itself before the Turks sued for peace. Turkish power was forever broken in Europe.

—Christopher Howell

Austrians, most notably at Grocka (1739), and forced them to sue for peace. The Treaty of Belgrade, signed in 1739, proved to be a sweet retribution for the Ottomans, who compelled Austria to surrender Belgrade and parts of Wallachia.

Until the end of the eighteenth century, Austro-Ottoman relations remained relatively peaceful and focused on commercial and diplomatic

contacts. The Russo-Ottoman War of 1787–1792 changed that. Empress Catherine II of Russia shared her Greek Project—partitioning of the Ottoman empire—with Emperor Joseph and convinced him to take part in Russia’s war against the Porte. In 1783 Austria supported Russian annexation of the Crimea, an Ottoman vassal state, and this strained Austro-Ottoman relations. When the Porte declared war on Russia in August 1787, Austria joined as Russia’s ally, hoping to reverse territorial losses suffered in 1739. Yet early on Austrians suffered a major defeat at Karánsebes (September 1788), allowing the Turks to launch devastating raids deep into the Banat of Temesvar. Although Austrians later recovered their position and even captured Belgrade, unrest in the Netherlands and Hungary, compounded by Prussian hostility, compelled Vienna to end the war at all costs. The Treaty of Svishtov (Sistova) reestablished the prewar situation, with only minor Austrian territorial gains in Croatia.

Russo-Ottoman Wars

Starting in the fifteenth century, the emerging Russian state and the Ottoman empire shared a long border and competed for territory and influence in the Balkans, the Crimea, and the Caucasus. Although the two empires were often brought into conflict with each other because of their alliances with other great powers in Europe, the early Russo-Ottoman wars were caused mainly by Russia’s desire to establish a warm-water port

on the Black Sea, which was under Ottoman control. The Ottomans initially used the term “Moskov” or “Moskovlu” to refer to the Russian state that emerged around the principality of Moscow (the so-called Muscovy or the Muscovy Rus). The first formal diplomatic contact between the two states took place in 1492 when the Muscovite embassy arrived at Constantinople to discuss long-distance trade. The Porte began to use the term “Rusiya” at the end of the seventeenth century when the Muscovy Rus came to include parts of Ukraine, and it was only in 1741 that the sultan recognized the Russian rulers as the “Emperors of All the Russias” (*tamamen Rusiya*). The early Russo-Ottoman relations were marked by a clear distinction in status between the powerful Ottoman state and the rising Russian principality. The sultans refused Russian offers of alliance and oftentimes relegated Russian affairs to their vassal khans of the Crimea, who conducted periodic raiding expeditions to the southern provinces of Muscovy. By the mid-sixteenth century, however, Muscovite Rus became strong enough to resist the Crimean Khanate, and Tsar Ivan IV (r. 1533–1584) destroyed the Kazan and Astrakhan khanates, important allies of the Crimean Tatars, during 1552–1556.

Since the Black Sea was bordered by the Ukraine to the north, the Ukraine was an area of constant struggle involving Russia, Poland, the Ottoman empire, and the Don Cossacks for most of the seventeenth century. During 1637–1642 the Don Cossacks captured Azov, an important Ottoman fortress, that they offered to Tsar Mikhail of Russia; however, the first Romanov ruler declined it to avoid a direct conflict with the Porte.

In 1654 following a powerful Cossack uprising against Poland, Russia signed the Treaty of Pereyaslavl with the Cossacks that granted Russia control over parts of eastern Ukraine. The Russian expansion, however, provoked a war with Poland and the Crimean Khanate, supported by the Ottoman empire. In 1672 the Ottoman Army occupied parts of southern Ukraine, and a preliminary contest between Russia and the Ottoman Turks began in 1676 after the Cossacks, under Ivan Samoilovich, hetman of the Left-Bank Ukraine, asked for Russian assistance against the Turks, who supported his rival

Hetman Petro Doroshenko. The Russian Army, supported by Ukrainian allies, captured the Cossack capital of Chyhyryn in 1676. The following year a large Ottoman army, under Ibrahim Pasha, invaded Ukraine and besieged Chyhyryn, although a Russian attack soon forced it to retreat. In 1678 the Ottomans besieged Chyhyryn once again, capturing it in August. Over the next two years the two sides limited their actions to raids and border attacks before the Treaty of Bakhchisarai, signed in 1681, established a buffer zone between the Ottoman and Russian-controlled regions of Ukraine.

In 1686 in the wake of the Ottoman defeats against the Holy League (Austria, Venice, Poland, and the papacy), Russia, under regent Sofia Alekseyevna, joined the war and organized two invasions, led by Prince Vasily Golitsyn, of the Crimean Khanate in 1687 and 1689, but both efforts ended disastrously for Russia, contributing to a discontent that resulted in the ouster of Sofia by her brother Peter. In 1695 Peter I took personal command of a force that sought to capture Azov, an Ottoman fortress on the northern shore of the Sea of Azov, an inlet of the Black Sea. Most of the Russian troops approached the area by traveling down the Don and Volga rivers. Because the Russians had no navy, however, they were unable to cut off the Ottoman access by water to the fortress at Azov. The Ottoman defenders turned back the Russians with heavy losses. Subsequently Peter took a year to build a navy at the Don River city of Voronezh. In the spring of 1696 the Russians again approached Azov with an enlarged force of some 75,000 troops. This time half the force traveled on the new warships down the river, and half came overland. As the land force engaged the fortress's defenders, the naval force was able to defeat the Turkish warships and blockade the fortress from the sea. The Russians were able to capture the city on July 28, 1696. Four years later the Treaty of Constantinople compelled the Porte to acknowledge Russia's control of the fortresses of Azov, Taganrog, Pavlovsk, and Mius.

Emboldened by his military success against the Swedes, whom he crushed at Poltava in 1709, Peter decided to force the Ottomans to open Constantinople and the straits to Russian commerce and gain free passage to the Mediterranean Sea.

Hoping to incite anti-Ottoman rebellion among the Orthodox Christian population of the Danubian Principalities (Wallachia, Moldavia, Bessarabia), Peter launched an ill-prepared campaign in the basin of the Pruth River, where he was defeated at Stanileshti (July 1711) and was surrounded by the Ottoman (and Crimean) forces under Grand Vizier Baltaci Mehmet Pasha. On July 21, 1711, Peter accepted the Treaty of Pruth, which required him only to restore Azov and its surrounding territory to the Turks. Considering Peter's desperate situation, the Turks certainly could have made greater demands but missed that opportunity.

In 1735 after a long period of occupation with European rather than Ottoman affairs, Russia, in league with Austria and Iran, declared a new war on the Ottomans. The Russian troops, led by Field Marshal Burkhard Christoph von Munnich and General Peter Lacy, invaded Crimea twice and captured Perekop, Azov, and Ochakov but were later forced to retreat due to logistical difficulties and a plague epidemic. In 1739 the Russians advanced into southern Ukraine, defeating the Turks at Stavuchany and capturing Khotin and Yassy. Meanwhile Austria, whose troops had been less successful than Russia's troops, was forced to sign a peace agreement that led to the Treaty of Belgrade in 1739. With its ally gone and war with Sweden looming, Russia chose to sign the Treaty of Nissa in October 1739. Russia restored portions of Moldavia and Bessarabia, including the city of Khotin, to the Turks, and promised to dismantle the fortifications at Azov, which Russia retained as a port. The Turks, however, opened the Black Sea to Russian commercial activity.

During the reign of Catherine II, the Russo-Ottoman conflict entered a new stage determined by Russia's role in the partitions of Poland and the increasing sophistication of the Russian military. In 1768 Russia interfered in Polish affairs, seeking to extend its authority over the once-mighty Polish-Lithuanian Commonwealth. Having promised help to Poland six years earlier, Sultan Mustafa III declared war on Russia in late 1768. Unlike the previous Russo-Ottoman war, Russian empress Catherine II made sure that her states were well prepared. In 1770 Russian troops led by Field Marshal P. A. Rumyantsev advanced

into Moldavia and defeated the Turks under Kaplan Girey and Ivazzade Halil Pasha at Larga and Kagul. The defeat at Kagul, one of the worst in Ottoman history, was so decisive that it spurred the Ottomans into introducing a series of Western-influenced reforms into the Ottoman Army. By the summer of 1770 Moldavia was occupied by the Russians. Meanwhile, the Russian fleet, under the command of Count Alexis Orlov, reached the coast of Greece, where it won the Battle of Chios on July 5, 1770. Two days later Orlov completely destroyed the Turkish fleet at Chesma Bay. In 1772 the Russian fleet bombarded Beirut to assist local rebels against the Porte and conducted diplomatic negotiations with the mamluk leader Ali Bey of Egypt. A Russian expeditionary force was also sent to eastern Georgia, where Georgian king Erekle II scored a major victory over the Turks at Aspindza (1770).

After a failed attempt to negotiate in 1772, the hostilities resumed in earnest. The Russian troops, under General Alexander Suvorov, also advanced to the Danubian Principalities, crossing the Danube in 1773 and 1774 and scoring a decisive victory at Kozluca (now Suvorovo) in 1774, which forced the Ottoman commander Muhsinzade Mehmed Pasha to sue for peace. The Treaty of Kuchuk-Kainardji was signed in July 1774. The treaty proved to be rather consequential for the Ottoman empire and had long-term effects on the history of the Middle East. Under Russian pressure, Sultan Abdulhamid I recognized the independence of the Crimean Khanate, which was annexed by Russia just nine years later, and ceded the territories in the northern Caucasus. The Ottoman empire retained Moldavia and Wallachia but recognized Russia's special position in the region. The Ottoman authorities also granted commercial privileges to Russian merchants throughout the empire and agreed to pay a heavy war indemnity.

The most consequential articles of the treaty dealt with Russia's role inside the Ottoman empire. Russia received the right to open consulates in any place within the Ottoman empire. The sultan agreed to let Russia establish a Russian Orthodox Church for local Russians in the Galata district of Constantinople (Istanbul). Article 7 also granted Russia the right to represent (and protect) the church and its personnel.

These provisions proved to be highly controversial, as disagreements over their interpretation quickly emerged between Moscow and Istanbul. Russia interpreted the provisions as granting it the status of the protector of Ottoman Orthodox Christians, which allowed Russia to actively interfere in Ottoman domestic affairs. The treaty was crucial in the development of the "Eastern question" and contributed to the outbreak of the Crimean War in 1853.

Ottoman-Safavid Wars

The Ottoman-Safavid wars included a series of conflicts between the Ottoman empire and Safavid Persia in the sixteenth and seventeenth centuries. In the early sixteenth century, Ismail, a Safavid leader who claimed descent from the Prophet Muhammad and Ali, succeeded in establishing a theocratic state in western Iran. In 1501–1503 Shah Ismail gained control of central and southern Iran, and by 1508 he campaigned in southwestern Iran and Iraq. The growing Safavid power soon threatened Ottoman interests in the region. In 1509–1512 Ismail played an active role in a civil war fought between the sons of Sultan Bayezid II, supporting Prince Ahmed against Selim. After seizing the Ottoman throne in 1512, Sultan Selim I prepared for a campaign against the Safavids. Aside from political considerations, religious differences (Sunni Ottomans versus Shia Safavids) also prompted this conflict. In 1514 Selim began the long march from

Adrianople to Azerbaijan. Ismail initially practiced a scorched-earth policy but then engaged the Ottomans in a decisive battle. Lacking artillery and trained infantry, the Safavid army suffered a decisive defeat in the Battle of Chaldiran in August 1514. Selim then plundered the Safavid capital of Tabriz and returned to Anatolia. In the next year's campaign the Ottomans captured the fortress of Kamakh and established control over Kurdistan and parts of Syria (Albistan). However, Ottoman inroads into Syria led to the Mamluk-Ottoman War in 1516–1517, which diverted the Ottoman attention from the Safavids and allowed Ismail to regroup, although he never seriously threatened the Turkish domain.

After the death of Shah Ismail in 1524, the Safavid Crown went to Shah Tahmasp, who exploited Ottoman preoccupation in Europe, where Suleiman I (Suleiman the Magnificent) conducted major campaigns in Serbia and Hungary, to stir up rebellion in eastern provinces of the Ottoman empire. Tahmasp also opened diplomatic negotiations with the Habsburgs on the creation of a Habsburg-Safavid alliance against the Ottomans. In response, Suleiman provoked the Uzbeks in Transoxania to attack Iran from the east. The war between Suleiman and Tahmasp began in earnest in 1526. The Ottomans, led by Grand Vizier Ibrahim Pasha, who was later joined by Suleiman himself, invaded Iraq and, over the next eight years, captured Baghdad, Bitlis, and Tabriz. Tahmasp avoided pitched battles and waged a scorched-earth strategy. Tabriz, recaptured by Tahmasp in early 1535, was sacked later that year by Suleiman. Minor skirmishes and border fighting persisted for almost a decade. The Safavid capture of Tabriz and Van provoked a second campaign by Suleiman in 1548. Yet again, Tahmasp adopted a scorched-earth policy, laying waste to Armenian highlands. The Ottomans reclaimed both Tabriz and Van as well as additional fortresses in Armenia and Georgia.

After a three-year hiatus, the war resumed in earnest. The Safavid attack on Erzurum in 1552 led to a counterattack by Suleiman, who reclaimed Erzurum and invaded western Iran in 1553–1554. Unable to defeat the Ottomans, Tahmasp chose to negotiate, signing the Treaty of Amasya in 1555. Under the terms of the treaty, the two powers determined their spheres

of influence, with Iran receiving Azerbaijan, eastern Armenia, eastern Kurdistan, and eastern Georgian kingdoms, while the Ottomans claimed all of western Georgia, Arabia, Iraq, and western Armenia and Kurdistan. Kars was declared neutral, and its fortress was destroyed.

The Peace of Amasya lasted until an Ottoman offensive in 1578 sought to take advantage of a period of Iran's weakness under Shah Muhammad Khudabanda (r. 1578–1587). The death of Shah Tahmasp I in 1576 resulted in a two-year-long civil war over the succession that weakened the Safavid state and led the Ottoman Turks to believe that Iran could at last be conquered. In 1578–1585 Sultan Murad III's armies seized Kars and invaded Georgia, where they captured Tbilisi (Tiflis). The Ottoman expansion into Georgia forced Shah Muhammad to release Georgian king Simon I of Kartli to fight the common enemy. Simon achieved considerable success in eastern Georgia, where he reclaimed the key fortresses of Lori and Gori before besieging Tbilisi in 1579. In 1580 he repulsed the Ottoman expeditions in Kartli, and in 1582 he routed a major Ottoman army on the Mukhrani field. The Ottomans, meantime, conducted operations in Daghestan and Azerbaijan and gained considerable success at Ganna and Karabagh in 1588. With Uzbek attacks intensifying in eastern Iran and the Ottomans capturing Tabriz in 1590, Shah Abbas Shah, who succeeded Shah Muhammad two years earlier, chose to enter into peace talks. The Treaty of Constantinople (also known as the Treaty of Ferhat Pasha, who commanded the Ottoman forces), signed in May 1590, ended the war. The treaty gave the Ottomans control of Azerbaijan, Georgia, Armenia, most of Qarabagh (except for Ardabil), most of Iranian Kurdistan, Luristan, and Daghestan.

The Safavids refused to accept the loss of vast territories in the Caucasus. After subduing Uzbeks, Abbas exploited Ottoman problems in Hungary to launch an offensive from the east. A surprise attack by the Safavid army led to the capture of Tabriz in late 1603. While Abbas commanded the main offensive in the northwest against the Ottomans led by Chighalah Pasgha, smaller Safavid forces raided Iraq and southern Caucasia. Ottoman sultan Ahmed I led a large army against Abbas but was defeated near Lake

➤ NADIR SHAH

Nadir Shah, born into a pastoral family of the Afshar Turkmen, had already established a strong military reputation by 1722 when Ghilzai Afghans invaded Iran and deposed the Safavid dynasty. By 1729, Nadir aligned himself with the surviving Safavid shah and helped drive the Afghans out of Iran. Facing Ottoman and Russian attacks and collapsed central authority, he successfully dealt with these threats, driving the Ottomans out of western Iran while simultaneously pressuring Russia into northern Iran. In 1736, he felt himself powerful enough to depose the shah and claim the throne himself. Over the next decade he embarked on a series of brilliant military campaigns that established the last great nomadic empires of conquest, which stretched from Baghdad to Delhi. In 1735 (and again in 1745), he crushed the

Ottomans in Iraq; in 1737–1739, he invaded Afghanistan and then India, destroying the Mughal army at the Battle of Karnal. After looting the Mughal treasury, which included the famous bejeweled Peacock Throne, the shah turned north to wage war in Central Asia and the Caucasus. By 1745, Merv, Bukhara, and Khiva as well as eastern Georgia and Azerbaijan were Iranian vassals. Despite his successes, Nadir had come to be regarded as a cruel and capricious tyrant, more feared than respected. The last years of his life were marked by mistrust and outbursts of extreme violence. A group of discontented officers organized a conspiracy against Nadir and assassinated him in June 1747. His death plunged Iran into a prolonged civil war.

—*Alexander Mikaberidze*

Urmia in 1606. Following up on his success, Abbas captured Baghdad, Mosul, and Diarbekkh by 1608, thus reclaiming almost all areas that the Safavids had lost in the preceding decade. In 1612 the new Treaty of Constantinople confirmed the Ottoman-Safavid frontier on the line established by Selim I and Ismail almost 100 years earlier; in return, the shah pledged to deliver 200 pack loads of fine silk annually to the Sublime Porte.

The Safavid failure to deliver the silk served as a pretext to the resumption of hostilities in 1616. An Ottoman army besieged Erivan (Yerevan) in 1616 but was repulsed and forced to withdraw. In 1618 the Turks attacked in the direction of Tabriz but were defeated at Soltaniyeh. Afterward peace negotiations began, resulting in the Treaty of Sarab (1618) that confirmed the terms of the last peace treaty.

The war of 1623–1639 was the last major war between the Safavids and Ottomans. It began as a result of a power struggle between local officials in eastern Ottoman provinces. Abaza Mehmed Pasha, the governor of Erzurum, rose in rebellion, while Baghdad had been, since 1621, in the hands of Janissary Subashi Bakr and his followers. Bakr futilely appealed to Sultan Murad IV for recognition as the new pasha, and when the sultan ordered Hafız Ahmed Pasha, the governor of Diyarbakir, to restore order in Baghdad,

Bakr turned to Abbas, who sent troops to assist him. To prevent Safavid capture of Baghdad, Hafız Ahmed chose to negotiate with Bakr and convinced him to recognize the sultan's authority. In response, the Safavid forces besieged Baghdad and captured it in January 1624. In the wake of this major victory, Abbas's troops took control of most of Iraq, including Kirkuk, Mosul, Najaf, and Karbala, the last two cities being holy to the Shiites. To recover these territories, the sultan dispatched Hafız Ahmed Pasha, who was appointed the grand vizier. The Ottomans organized several campaigns during 1625–1639. In the first campaign, the Ottomans captured Mosul in northern Iraq but unsuccessfully besieged Baghdad in 1625–1626; three years later, as Shah Abbas died in January 1629, Grand Vizier Gazi Ekrem Khusrev Pasha led another campaign into Iraq. Although he gained a victory at Mihriban (near Kermanshah) in May and sacked Hamadan in June, he failed to capture Baghdad in November and was forced to return due to bad weather. The Safavids reclaimed parts of Iraq, their efforts facilitated by the Janissary revolt and the murder of the grand vizier in February 1632.

Sultan Murad spent almost five years subduing internal revolts before he was able to turn his attention to Iraq. In March 1635 the sultan opened his campaign against Erivan, which was

captured in August 1635. One month later the Ottomans occupied Tabriz, but their campaign then stalled. Shah Sefi organized a Safavid counterattack that reclaimed Erivan in April 1636 and defeated the Ottomans at Ardalan (central Iran) in October. Sultan Murad delayed the start of a new campaign until 1638, when his army marched to Baghdad. Led personally by Murad, the Ottomans captured Baghdad in December 1638 and effectively restored their authority in Iraq. Peace negotiations soon began, resulting in the Treaty of Zuhab (or Treaty of Qasr-e-Shirin, May 1639) that established a boundary between the two empires that remained virtually unchanged into modern times. The treaty recognized Iraq (including Baghdad and the Shatt al-Arab), western Caucasia, and Kurdish territories as part of the Ottoman empire but granted southwestern Caucasia to Iran.

In 1722 the Safavid dynasty collapsed following the Afghan invasion. As Iran descended into political chaos, the Ottomans regarded it as an opportunity to expand their territory in Azerbaijan and western Iran, but their efforts failed due to local resistance as well as the rise of Nadir Shah (1730–1747) of the Afshar dynasty.

Mughal-Safavid Wars

By the late sixteenth century, the Safavid empire, expanding eastward, and the Mughal empire, seeking new territories to the northwest, clashed over the issue of a sphere of influence in Afghanistan. Their conflict concentrated on the strategic

city-fortress of Kandahar, believed to be the key to controlling Afghanistan. In 1595 two Safavid princes defected to the Mughal court, surrendering the fortress to Emperor Akbar (1542–1605). In 1622 after consolidating his authority at home, the Safavid shah Abbas organized a major expedition to reclaim Kandahar. After a monthlong siege, the Mughal garrison surrendered. The Mughal emperor Jahangir (1569–1627) initially planned to send a punitive expedition and tasked his son Khurram (the future Shah Jahan) to lead it, but the expedition never materialized because Jahangir soon fell seriously ill and passed away. The Mughal court became embroiled in a bitter power struggle for the next few years.

Once Shah Jahan secured his authority, he turned his attention to Kandahar. The moment seemed opportune, since the death of Shah Abbas in 1629 caused domestic instability in Iran. In 1638 as the Mughals made preparations for the campaign against Kandahar, Ali Mardan Khan, a Safavid commander of Kandahar who quarreled with Shah Safi (r. 1629–1642), defected to the Mughal side and surrendered the fortress to Shah Jahan.

A decade passed before the Safavids were able to turn their attention to Kandahar. Shah Abbas II (r. 1642–1666) launched an expedition in 1648 and, after a two-month-long siege, captured the fortress. The following year the Mughals counterattacked under the leadership of young Aurangzeb, who laid siege to the fortress but could not take it before the onset of winter. The Mughals returned in late 1652 and once more in 1653 but failed to take the fortress on both occasions due to bad weather and logistical difficulties as well as a tenacious defense by the Safavid garrison.

Islamic Wars of Empire in West Africa

Between 1450 and 1750 CE, conflict increasingly defined the basis for political formation in West Africa. The ascendancy and decline of Songhai demonstrates the key role that the larger Islamic world played in the character of large empires. Smaller states were formed both in response to and in order to further the spread of Islam in the region.

The ruler Sunni Ali Bar (1464/1465–1492) seized control of the western Sudan by taking advantage of imperial Mali's weakened state to create the foundations of the empire of Songhai. An avowed Muslim, Sunni Ali based his polity on the lucrative trading centers of Gao, Timbuktu, and Jenne. Revered by some for his victories over raiders and hated by others for his tyrannical oppression, Sunni Ali organized the government system into provincial governors and created the basis for a civil service.

The century of rule that followed Sunni Ali's death was known as the Askia dynasty (1492–1592) and constituted a successful series of African rulers intent on expansion in concert with the larger world of Islam. A professional army was created, and the conquests of the empire

continued to expand its territory while promoting Islam. The era marked a period of intellectual and commercial vitality beginning with the conversion of urban elites to the faith and expanding to include the orbit of many smaller communities that remained firmly rooted in African traditions.

Other Muslim states also resisted Songhai overlordship and rebelled continuously. Yet the Songhai era persisted until the Moroccan sultanate's invasion of Songhai in 1571 effectively toppled the domination of the Sudan. Historians still debate the inevitability of Songhai's defeat in the Battle of Tondibi (1591) as a consequence of the technological advantages of Morocco (with firearms) rather than the result of internal disorder or administrative flaws. The decline of the great state nonetheless had a lasting impact on West African political development.

Not all political states were Muslim ones, nor did they always owe their origins to the spread of Islam. Mossi and Bamana resistance to Islam remained significant. By the 1660s, a Bamana state had emerged at Segou-Koro. Under the leadership of a warrior named Mamary Coulibaly (also known as Biton), who ruled from about 1700 until his death in 1755, the male age-grade organization was militarized and its religious

➤ WEST AFRICAN PRAISE SINGERS UNDER ISLAM

Before the arrival of literacy, West African states relied on the oral transmission of traditions across generations. Performers skilled with words and music served the political leaders of small villages and large empires. These specialists in shaping the past were known in Mande society as *jeliw*, in Wolof as *gewel*, and in Fulbe as *gawlo* (sometimes also called “griots”). The praise singers of West African empires were key allies to rulers and elite. Their performances could instill pride in warriors and ensure victory on the battlefield. They were spokespersons and advisors, mediators and diplomats. Their knowledge of genealogy and history played a crucial role in forming historical consciousness and maintaining the social and political fabric of society.

While the influence of bards declined in the Islamic era, they didn't entirely disappear. The

presence of Sufi performers and Muslim marabouts filled familiar roles, but the African praise singers also carried influence in Islamic societies. The performances of traditionalists continued to remember and record kings, battles, conquests, and migrations. They could inspire loyalty or rally reform. From the sixteenth century, West African Islamic scholars relied on oral traditions, and their subject matter influenced the writing of *tarikhs*, or local histories. Eighteenth-century travelers record the respect in which the traditionalists and praise singers were held. The ambiguity and contradictions of the spoken (and sung) words of oral specialists provide historians today with meaningful checks and balances on both Islamic and European versions of the past.

—Candice Goucher

and social foundations expanded in support of the state.

In the eastern Sudan, the Islamic dynasties at Kanem and Borno relied on trade in slaves and horses to maintain control between the area of Lake Chad and the Fezzan of North Africa. Their strong military cavalries waged successful jihads on the countryside during the sixteenth century. Control over peasant populations provided taxes and a lucrative income in the form of food, salt, and other tribute. The army was modernized with firearms and advisors from the Ottoman empire after the 1650s.

In northern Nigeria, the Hausa city-states (founded in the eleventh and twelfth centuries CE) flourished from the seventeenth to the eighteenth centuries. Ruling elites waged jihads on the unbelievers of the countryside and traded captives across the trans-Saharan routes to North Africa. Hausa traders carried their language, religion, and goods across a vast network of commercial arteries. The spread of Islam to the masses in the eighteenth century eventually provoked reform movements, culminating in the Wahabbism-influenced jihads of Usman dan Fodio (1754–1817), the Fulani son of a Muslim teacher in the northern Hausa state of Gobir and considered by some to be a divinely inspired reformer (Mujaddid).

Between 1650 and 1750, the most successful jihads were waged at the western end of the former Songhai territory in the Senegambia. At the imamate of Futa Djallon, Fulas gained political power in the eighteenth century. Service in the army was compulsory for Fulas and Mandinkas and was controlled by the almamy, a religious leader, who was guided by the council of democratically selected elders. With the monopoly over literacy and economic empowerment, Muslim merchant-clerics did as much to spread Islam as did the conquering armies of urban elites.

The era of conflict did not go unnoticed by European merchants on the West African coasts. They benefited from the instability of the interior; the changing ecology between 1630 and 1860, when drier conditions prevailed; and the shifting trade routes. Dessication and deforestation increased the amount of conflict over scarce resources, encouraging both Fula and Bambara expansion as well as European incursions. If

conflict defined the contours of political change, it did not always dominate the everyday lives of people. The Scottish traveler Mungo Park observed the hospitality of Segu in the late eighteenth century, remarking with surprise at the “prospect of civilization and magnificence” in the peaceful and generous society that welcomed him.

Valois-Habsburg Rivalry

A long-standing political rivalry existed between two of the major ruling houses of Europe and dominated the political affairs of the sixteenth century. The House of Valois, the ruling house of France, was pitted against the House of Habsburg, the ruling dynasty of the Holy Roman Empire, the Netherlands, and Spain. It was a rivalry rooted in the complex political balance of power in Europe, beginning in the Middle Ages. The rise of the Habsburg family can be dated to the early twelfth century in Switzerland. Within a few generations of land acquisitions, the Habsburgs managed to secure the throne of the Holy Roman Empire. For several centuries, the Habsburgs intermittently held the imperial throne, along with extending influence elsewhere in Europe through marriage. These marriages often involved close relations and had eventually resulted in significant genetic anomalies and probably contributed to the eventual demise of the dynasty.

The Valois gained the throne of France in 1328 with the death of Charles IV, the last king of the House of Capet (Capetian dynasty). Charles IV died without a surviving male heir, so Philip of Valois, a cousin of Charles IV, took the French throne as Philip VI. This dynastic change in France was also a precursor to the Hundred

➤ MARRIAGE AND THE HABSBURGS

Historians often cite the rise of the Habsburg family as one of the most powerful in the story of Europe. Such dominance may have been won at a high cost. The chief approach to political dominance employed by the Habsburg family throughout the history of the Middle Ages was through marriage into other royal and powerful noble families. A popular motto often ascribed to the family eloquently expressed this idea: “Let others wage war, but you happy Austria, marry!” However, as the Habsburg presence and influence extended throughout the families of Europe through marriage and blood descendants, such a tactic eventually meant that there were close relational (consanguineous) marriages. Over the course of many generations this exerted a significant genetic toll. The so-called Habsburg chin, the excessively squared jaw evident among the Habsburgs by the fifteenth century, is one illustration of this and is clearly seen in coinage and portraits. Interestingly, this trait was found not only among Habsburg men but also among women of the family. By the time of the late seventeenth century, there had been so much close intermarriage within the Spanish Habsburgs that Charles II earned the undesirable nickname of *el hechizado* (“the bewitched”) due to his overtly obvious genetic deformities.

—Cheryl H. White

Years’ War wherein Edward III of England asserted his claim to the French throne through his descent from Philip IV of France through his mother, Isabella.

After the conclusion of the Hundred Years’ War, the Valois kings of France undertook efforts to centralize their power by diluting the power of a rival political faction in Burgundy. In keeping with the long-standing Habsburg tradition of using marriage as a means of extending political influence and control, Holy Roman Emperor Maximilian I married the last Valois duchess of Burgundy, named Mary, in 1477. The son of this union, Philip the Handsome, in turn married Juana of Castile, who was the second-eldest daughter of Fernando of Aragon and Isabel of Castile. Juana became heiress to the thrones of Castile and Aragon after the deaths of her brother Juan in 1497 and sister Isabel in 1498. However, her sanity was in question, and she was forced

to share her throne with first her father and then her son, Charles, who eventually took possession of both the Habsburg claim to the Holy Roman Empire and the thrones of Aragon, Leon, and Castile, thus essentially unifying Spain. As a result of this complex turn of events, he ruled his Burgundian lands from 1515 and became Carlos I of Spain in 1516 and Holy Roman Emperor Charles V in 1519. This so-called Habsburg Ring surrounded France and created a political threat to the power of the French Crown.

The threat of Habsburg domination in Europe was daunting in terms of territorial possessions and inherited titles. Charles V was heir to the Netherlands and the French Comte, the Spanish kingdoms of Aragon and Castile (along with the growing Spanish New World Empire), and the Holy Roman Empire. France was concerned about the formidable potential for control posed by this situation, but in reality Charles V’s authority varied from territory to territory throughout the German states of the Holy Roman Empire. In addition, his authority in the Spanish kingdoms was resented, as he never assimilated to the Spanish language or court traditions. Thus, Habsburg military domination was harder to come by than its perceived political domination. As the intense rivalry manifested itself during this age in European history, the House of Valois had significant resources of its own, considering the dense population of France and increasing centralization and consolidation of power within the monarchy. Also, the French king could reliably depend upon a stable income in the form of fixed taxation to finance military campaigns, something that the Habsburgs often could not depend upon.

Armed conflicts between the rival houses of Europe had their origins in the fifteenth century, when French kings Charles VIII and Louis XII undertook military campaigns in Italy to assert claims to the kingdom of Naples and the duchy of Milan. These actions resulted in Pope Julius II’s organization of an alliance called the Holy League that repulsed the French and stopped the extension of Valois influence on the Italian peninsula. However, the French king Francis I launched a second invasion of Italy in 1515, winning a significant victory at Marignano and spurring a wider war with the Habsburg Holy Roman emperor. At the Battle

of Pavia in 1525, forces of Charles V defeated the French and captured Francis I and held him for ransom. The French king was able to secure his release by promising to cede Burgundy to Charles V. Francis did not keep this promise to the Habsburg emperor, and war soon resumed between the powers, lasting until the death of Francis I in 1547.

The next king of France and son of Francis I, Henry II, was married as a teenager to Catherine de Medici in an effort to forge a strong political counterweight to the power of the Habsburgs. Once again, war resulted when Henry II invaded Italy in 1551. This conflict is known as the Italian War and reveals that the dynastic concerns related to the balance of power in Europe were far from over and not limited to the personalities of Francis I and Charles V (Carlos I of Spain). In 1555 Charles abdicated all of his titles, leaving his enormous empire split in half; his son Philip II took control of Spain, the Netherlands, Naples and the overseas empire, while Charles's brother Ferdinand I became Holy Roman emperor. In response to the Italian invasion, Philip II of Spain launched an invasion of northern France, and the conflict continued until 1559. This series of wars was quite damaging to both France and the Holy Roman Empire. At the same time, Europe was facing the great intellectual, social, and religious upheaval wrought by the Protestant Reformation, ensuring that military conflicts would now also carry the weight of religious concerns.

The death of French king Henry III in 1589 marked the end of the Valois dynasty. He had struggled to reach a compromise between religious factions of Catholics and Huguenots in France. This was an attempt that eventually resulted in Henry III's assassination at the hands of Roman Catholic extremists who feared that he would be succeeded as king by the Protestant Henry of Bourbon. In Spain the House of Habsburg effectively ended in 1700 with the death of Carlos II. Known as "the bewitched," Carlos was a mentally and physically weak young man who represented a culmination of all of the genetic inbreeding that had plagued the Habsburgs throughout the centuries. He was replaced by his great-nephew, Philip VI of the House of Bourbon, after the War of the Spanish Succession.

War of the Austrian Succession, 1740–1748

The War of the Austrian Succession was a major global conflict, fought mainly in Europe, that involved most of the major European states with the exception of the Ottoman empire, Portugal, and Poland. The war began as a result of Prussian designs on Austria's province of Silesia. Prussia utilized the pretext that Maria Theresa of Austria could not inherit the Habsburg throne from her deceased father Charles VI. The war pitted Prussia, France, and Bavaria against Britain, Spain, the Netherlands, and Russia, with Britain fighting against France and Spain overseas in their adjoining colonial possessions in North America (King George's War and the War of Jenkins's Ear, respectively), with most of the other belligerents fighting in Europe. While the war began as a Prussian attempt to expand its territories in Germany, it rapidly turned into a major war. French and Spanish Bourbon attempts to engage the Austrian Habsburgs and British desires to prevent any one major power from dominating Europe led to their immediate involvement in the conflagration.

In 1740 Maria Theresa inherited the Habsburg throne upon the death of her father, complying with the stipulations adhered to by the Pragmatic Sanction of 1713, which the German states had agreed upon. Prussian king Frederick II decided to invade Silesia in December 16, 1740, thereby violating the Pragmatic Sanction and instigating war with Austria. Prussia's well-trained forces were able to seize the province with ease as Austria prepared to meet the challenge during the following campaign season. By 1741 France and Bavaria had joined Prussia, and their forces plotted to take Vienna. However, Austrian counteroffensives were able to prevent the seizure of the Habsburg capital. Moreover, Maria Theresa was able to appeal to the Hungarian aristocracy and raise a *levée en*

masse of troops to engage the foreign invasion of the Habsburg lands. Nonetheless, French forces were able to seize Prague and occupy Bohemia and install the elector of Bavaria as king of Bohemia by November 1741. He was subsequently elected Holy Roman emperor as Charles VII in January 1742. After unsuccessful attempts to remove the Prussians from Silesia, Austrians sued for peace on June 11, 1742, at Breslau, ending the First Silesian War.

In 1743 Bavarian and French forces suffered various setbacks in engaging Austrian forces and maintaining their positions along the Danube. Along with British forces, the Austrians were able to defeat French and Bavarian forces on June 27, 1743, at the Battle of Dettingen. The British, Dutch, and Austrian forces were now allied against the French and Bavarian forces, with Spain joining the latter coalition. Russia and Sweden were able to neutralize each other's attempts to join the greater war, thereby minimizing their involvement. In 1744 after concluding a secret treaty with the French, the Prussians swept into Germany. This was at a time when Austria and its allies were distracted by French forces under Louis XV in northern Europe amassed against the Austrian Netherlands. While British, Austrian, and Dutch forces were able to successfully engage French forces along the Rhine in various engagements, the Prussians ran unopposed across much of southern Germany.

In 1745 the Quadruple Alliance was officially formed by Britain, Austria, the Netherlands, and Saxony through the Treaty of Warsaw. With the death of Holy Roman Emperor Charles VII, the Holy Roman Empire's throne again became contested. Prussian forces were able to maintain their position in Silesia and southern Germany, with Austrian forces unable to oust them. Francis I of Lorraine, the husband of Maria Theresa, was elected Holy Roman emperor, a move opposed by the Prussians and the Bavarians. Despite Prussian successes against Austrian forces, Frederick recognized Francis I's acquisition of the Habsburg throne in the Peace of Dresden on December 25, 1745, while it was recognized by the Austrians that Silesia was a Prussian province. This agreement ended the Second Silesian War.

In southern Europe the war was characterized by Spanish and Italian engagements, given

Bourbon Spanish attempts to acquire territory in Italy, particularly Milan, with Italian states divided in terms of their loyalties. As Austrian forces ousted Spanish forces from northern Italy, they occupied formerly independent Italian states, most notably Genoa. In contrast, in northern Europe, British and Dutch forces engaged French forces in defense of the Austrian Netherlands as well as their own possessions. With a Swedish-Russian settlement made in 1743, Russian forces, allied with Austria, marched from Moscow to the Rhine in 1746. The overwhelmed French and Spanish forces were forced to come to terms or continue fighting against the enlarged coalition. The Peace of Aix-la-Chapelle, signed on October 18, 1748, formally ended the War of the Austrian Succession. In the end, Prussia was able to retain Silesia at the expense of Austria, which was the trigger of the whole conflict.

War of the Spanish Succession, 1702–1713

Charles II of Spain died in 1700 without any issue. As Charles was the last of the Habsburg dynasty in Spain, the main two contenders for the throne were Philip, the Duke of Anjou and grandson of Louis XIV of France, and the Archduke Charles of Austria, of the Austrian Habsburgs. In his will Charles II named Philip as his heir, with the archduke as an alternate. While Louis XIV was determined to keep his grandson on the throne, Holy Roman emperor Leopold I wanted to both gain the throne for his second son as well as block French hegemony over the Spanish empire. The preexisting Bourbon-Habsburg dynastic rivalry played a role in triggering this conflict as well as the fears of Britain, Portugal, and the Netherlands at seeing French domination of Spain and its global empire. Diplomatic arrangements to divide Spanish possessions in Europe (particularly in Italy) at Charles II's death proved futile

in pleasing either side. These fears were realized when, after the death of Charles II, Louis XIV had Philip declared as Philip V, king of the entire Spanish empire, which violated the Second Partition Treaty, ratified by England and France in March 1700. The treaty had delegated the Spanish throne to the archduke, while handing over the Italian territories to the French. However, William III of England did not have the support of Parliament in declaring war against France and was therefore forced to accept Philip as king.

In 1701 Louis XIV provoked the ire of England and the Dutch by cutting them off from Spanish trade and recognizing James II's son (the Stuart pretender) as king of England, deploying troops into the Spanish Netherlands, and sending French merchants into the Spanish Americas. As a result, the Grand Alliance of the previous Nine Years' War, namely Austria, England, Netherlands, Portugal, and Prussia, was reconstituted to fight against France to prevent its dominance of Spain and its possessions. After the death of William III in 1702, Queen Anne (the younger daughter of James II) assumed the throne to ensure the legitimacy of her position as heir to the crown. John Churchill, Duke of Marlborough (1650–1722), was appointed the commander in chief of Dutch-English forces on the continent. A brilliant strategist and diplomat, he engaged and defeated the French in three major battles: Blenheim (1704), Ramillies (1706), and Oudenarde (1708). Early in the war, Marlborough attempted to engage French forces in an open field battle in the Lowlands rather than attacking fortifications and implementing siege works, which his Dutch allies preferred. The Dutch were reluctant to engage in open field combat and refused to attack, allowing the French to maintain their garrisons. However, his decision to engage the French along the Danube River in the southern Holy Roman Empire changed the course of the war.

French attacks in the surrounding regions of Vienna, the capital of Habsburg Austria, made the Danube region a crucial focal point in the war. Moreover, France's ally, Bavaria, was adjacent to Austria. Max Emmanuel, elector of Bavaria, viewed this conflict as an opportunity to increase his power within the Holy Roman Empire at the expense of Habsburg Austria. As a result, Marlborough decided to engage French

➤ CHARLES II—THE LAST SPANISH HABSBURG

Charles II (r. 1665–1700) of Spain, known as “the Bewitched” or “the Hexed,” had developed mental and physical disabilities as a result of Habsburg inbreeding from centuries of intermarriage. He had a protruding lower jaw that did not allow him to chew his food and caused difficulty in speech and constant drooling. As a child he did not learn to speak until he was four, and he did not walk until he was eight. Reportedly, he was carried like an infant until the age of ten and was not forced to attend school or attend to his own personal hygiene by his nurses. It was popular belief that Charles' problems came from some sort of sorcery or curse. This belief led him to be subjected to exorcisms, the result of which led to the king's increasing mental disabilities. Moreover, he was unable to procreate with his first and second wives as a result of his sterility. His inability to conceive an heir allowed his cousins, French king Louis XIV and Holy Roman emperor Leopold I, who had married Charles's sisters, to conspire for his throne. While he was alive Charles faced overtures from both France and Austria, in the context of the Bourbon-Habsburg rivalry, to settle on a will that would provide a successor, which would ensure an heir amenable to their geopolitical ends. In his final years Charles had to deal with his wily cousins essentially devising how to divide his realms upon his death. Upon his death, the Spanish Habsburg line, which had seen its heyday in the reign of Philip II, came to an end.

—Abraham O. Mendoza

forces by sending 40,000 troops from the Netherlands to the Danube region (a distance of 240 miles or 390 kilometers) secretly. By 1704 he had linked up with Austrian forces under the command of Prince Eugene of Savoy and his 18,000 troops at the Bavarian border with Austria. A large French army had been massed in Bavaria to engage this growing force. On August 13, 1704, Marlborough and Eugene's forces, combining a multinational army composed of Dutch, Danish, Prussian, Hessian, Hanoverian, and Austrian forces 52,000 strong, confronted a Franco-Bavarian force superior in artillery in the Battle of Blenheim. By engaging his infantry in battle, at a heavy cost in deaths and other casualties,

Marlborough's forces defeated the French and Bavarian armies, taking Bavaria out of the war.

Along other fronts, Grand Alliance forces also proved successful against France and its allies. In Spanish Italy, French ally Victor Amadeus II, Duke of Savoy, switched to the Grand Alliance in 1703, leaving the French with no supporters. Prince Eugene defeated French forces in Lombardy and drove the French out of Italy. In Spain itself, in 1703 English naval forces captured Gibraltar and ensured a naval presence in the Mediterranean, and Portugal joined the Grand Alliance against France. By 1705, English and Dutch forces successfully took the Spanish city of Barcelona. While Charles III of Austria subsequently made himself king of Spain, he was defeated by Philip V's loyal Spanish forces at the Battle of Alamanza in 1707. A Bourbon, Philip V was preferable to the Spanish rather than the Austrian Charles.

Following up on his victory in Blenheim, Marlborough crushed French forces at the Battle of Ramillies in 1706 back in the Netherlands. This resulted in French forces evacuating the Spanish Netherlands, leaving them to the Grand Alliance. In 1708 French forces attempted to retake these territories but were soundly defeated by Marlborough and Eugene's forces at the Battle of Oudenarde in the Spanish Netherlands. They subsequently captured the major French fortress at Lille, thereby threatening an advance on Paris itself. Back in France, bad harvests and famine stressed French forces and resources, triggered revolts, and forced Louis XIV to sue for peace in 1709. The Grand Alliance wanted Louis to remove his nephew Philip from the Spanish throne as a condition for ending hostilities. Louis's refusal ensured the continuance of the conflagration. At the Battle of Malplaquet, allied forces under Marlborough and Eugene, composed of 110,000 troops, confronted a French force of 80,000. While the allies decidedly drove the French army off the battlefield, they did not pursue them. Moreover, the allied forces sustained twice as many casualties in this pyrrhic encounter (24,000 allied versus 12,000 French casualties). In the campaigning season of 1710–1711, allied forces were again on the offensive.

By 1711 the Grand Alliance dissolved when newly crowned Holy Roman emperor Austrian Archduke Charles VI, who held territories taken

from France, was abandoned by Britain (no longer just England since 1707 as a result of the Act of Union with Scotland) and the Dutch, who did not want to assist the Habsburgs in their bid for European hegemony. Moreover, Marlborough was relieved of command by Queen Anne who, bolstered by a Tory resurgence in Parliament, allowed for entering into negotiations with France. The Dutch were reluctant to continue in the war, as were other members of the Grand Alliance. In the end, all sides entered into negotiations resulting in the Peace of Utrecht (1713) and the Peace of Rastatt (1714). Philip V remained king of Spain but renounced ties with France and lost his European territories. Charles VI acquired all the former Spanish Habsburg lands in the Lowlands and in Italy but renounced his claim to the Spanish throne. France's borders were set back to those of 1697, with the English acquiring possessions in the Americas. Prussia attained Spanish Gelderland and the right for its elector to be king "in" Prussia, with other allies receiving some territorial compensation.

Sixteenth-Century Wars in Italy

The Italian Wars, also called the Great Wars of Italy, were a series of armed conflicts that lasted from 1494 to 1559, primarily involving France and Spain but also other European powers. The wars also featured a complex and changing set of alliances that at times pitted the major Christian powers of Europe against the Holy See of Rome. At issue was the control of the Italian peninsula, consisting of numerous small independent states that were often engaged in rivalry with each other. The lack of a comprehensive national unity in Italy during the early sixteenth century made these states particularly vulnerable to external aggression from the rival houses of Valois in France and the Habsburgs in

Spain and the Holy Roman Empire. There was a protracted struggle over the balance of power in Europe as a direct result of the Valois-Habsburg rivalry, and the weak and divided states of Renaissance Italy became the extension of that dynastic struggle.

The series of wars began in 1494 when the king of France, Charles VIII, invaded Italy at the invitation of Ludovico Sforza, the duke of Milan, who needed an ally against Venice. Charles seized the city-state of Naples, which provoked a reaction from other European powers because of French speed and brutality. Pope Alexander VI formed the League of Venice in 1495, consisting of King Fernando of Aragon, who was also king of Sicily; the duke of Milan, who turned against France when he realized that Charles could potentially have a claim on Milan; Holy Roman Emperor Maximilian I; and the Republic of Venice. In 1496 King Henry VII of England joined as well. While this alliance against France was initially successful, Charles's successor, Louis XII, was able to launch another invasion that resulted in the successful occupation of the city of Milan in 1499. However, in 1500 Louis XII reached an agreement with Fernando of Aragon to divide the city of Naples and took a French army south. Disagreements between Louis and Fernando over the exact details for partition of that kingdom soon erupted into war between France and Spain, ending in a Spanish victory and the expulsion of the French from Naples. Following decisive Spanish wins at Cerignola and Garigliano in 1503, Naples came under the control of Spanish general de Cordoba.

Meanwhile, the city-state of Venice was rapidly acquiring and expanding its own political power and attempting to exert influence over rival Italian states, including the papacy in Rome. Pope Julius II led France, Spain, and the Holy Roman Empire in forming a fragile alliance known as the League of Cambrai. In 1509 at the Battle of Agnadello the coalition defeated a Venetian army, but it was not long before tensions erupted yet again among the major powers. Pope Julius II decided that France was now the larger threat, and he withdrew from the League of Cambrai to forge an alliance with Venice. One year later the pope declared a Holy League against France, which included Spain, the Holy Roman Empire, and England. By 1512 the French were expelled

➤ EFFECT OF ITALIAN WARS ON ITALIAN RENAISSANCE

The wars in Italy during the sixteenth century brought about many changes throughout Europe. Although devastating to many of the Italian states, the wars likely had the effect of helping to spread the ideas and inspiration of the Italian Renaissance to other areas of northern and western Europe. Armies of France and the Holy Roman Empire and their political and diplomatic envoys took the Renaissance ideals beyond the borders of Italy to their home states and beyond. Although many historians mark the end of the Italian Renaissance with the onset of instability wrought by the sixteenth-century wars, foreign contact with the flourishing art and literature of the various Italian states was a corollary to military conflict. Most damaging to the Renaissance in Italy was the imperial occupation of Rome in 1527, which by stifling the power of the papacy effectively ended the support and patronage of that institution to artistic endeavors. With the waning of the Italian Renaissance, many of its influential figures migrated north, including Leonardo da Vinci, who went to France in 1516 at the invitation of Francis I. Other artists also joined efforts to create the School of Fontainebleau in France.

—Cheryl H. White

from the Italian peninsula a second time. However, the Holy League faced internal struggle as they fought over the spoils, resulting in Venice forming an alliance with France in 1513. The Holy League won a series of victories against the French, but the death of Julius II caused the league to fall apart. By this time Louis had died in 1515, leaving his successor Francis I to defeat the Holy League at Marignano that same year, and the league collapsed. As a result, all of northern Italy was ceded to France and Venice with the treaties of Noyon and Brussels.

The accession of the Habsburg Charles V as Holy Roman emperor in 1521 renewed tensions with France, as Francis had desired that title. Charles's addition of "Holy Roman Emperor" to his titles "King of Spain" and "Duke of Burgundy" provided a threat of the so-called Habsburg Ring, which surrounded France to the south, west, and east. This threat to the balance

of power in Europe served as the reason for France to begin another general war. Francis personally led a French army into Lombardy in 1525 but suffered a stunning defeat at the Battle of Pavia. Following this battle, the Spanish captured Francis and held him for ransom. This capture led Louise of Savoy, Francis's mother, to go to Ottoman sultan Suleiman the Magnificent to ask for his help. She managed to broker an alliance between the French and the Ottomans, an alliance that was completely unprecedented; at the time, it was unthinkable that a Christian monarch would ally with a Muslim one. Suleiman sent an ultimatum to Charles and used the situation as an excuse to invade Hungary in 1526, as it was on the way to Vienna. However, Francis was anxious to gain his own release and agreed to the terms of the Treaty of Madrid, in which he gave up his claims in Italy, Flanders, and Burgundy to the Habsburgs.

France was not alone in its concern over the political balance of power in Europe. The growing domination of the Habsburgs led Pope Clement VII to organize yet another coalition in 1526, this time involving the alliance of the papacy with several Italian states and France in the League of Cognac. By 1527 Holy Roman Emperor Charles V occupied Florence and the city of Rome, surrounding the Vatican with imperial troops. The pope was a prisoner of the Holy Roman emperor, and continued war forced Francis to conclude the Treaty of Cambrai in 1529, which removed him from the war. The League of Cognac dissolved, and Venice made peace with Charles.

Peace lasted until 1536, when the third war erupted between Charles V and Francis I with the death of the duke of Milan, Francesco Sforza. Charles's son Philip inherited the duchy, and France once again felt threatened by the expansion of Habsburg influence on the Italian peninsula. In response, Francis invaded Italy again and took the city of Turin but could not successfully occupy Milan. Charles then invaded France, defeated Provence and Aix-en-Provence, and reached Avignon before returning to Spain. This brief conflict ended in 1538 with the Truce of Nice but made no major changes to the existing state of French occupation of Turin or the Habsburg control of Milan.

Even though the Truce of Nice was to provide peace, neither Francis nor Charles was

happy with the status quo. Between 1538 and 1542 both parties attempted peaceful negotiations, but those broke down as Francis found that he could not give up his claim to the Duchy of Milan. Francis then partnered with Suleiman I of the Ottoman empire and combined Christian and Muslim forces for an invasion of Italy beginning in 1542. A joint fleet took the city of Nice in 1543, while French forces mounted a defeat of Charles's Imperial Army at Ceresole in 1544. Aligning with Henry VIII of England, Charles V countered with a general invasion of northern France. The efforts of the Anglo-Habsburg alliance crumbled due to lack of military coordination and cooperation, and the invasion of France was ended.

The final war in this series of conflicts involving the Italian states began in 1551. Henry II of France declared war against Charles V in order to recapture Italy. The decision of Charles V to abdicate his thrones in 1556 split the Habsburg control and essentially ended French ambitions in Italy by moving the fighting to central Europe, which guaranteed a Habsburg victory. By the terms of the Peace of Cateau-Cambresis in 1559, Henry II of France renounced all future claims to any of the Italian states and ended over half a century of aggression among the major European powers, with Italy as the principal battleground. The Italian Wars during the sixteenth century had significant consequences for the social and political environment of the Italian Renaissance and ensured that the various Italian states would suffer from a lack of unity until the nineteenth century.

A History of the British Raj

Robert Orme (1728–1801) was widely regarded as one of the foremost British experts on India during the mid to late eighteenth century. Orme was born in India, where his father worked as

a physician for the British East India Company, and he spent many years living and traveling in the Indian subcontinent during the 1740s and 1750s, when he worked for the company in several capacities (including as a writer).

In 1763 soon after his return to England, Orme published his seminal work, the three-volume *History of the Military Transactions of the British Nations in Indostan from the Year 1745*. Orme's book, being dedicated to King George III "to commemorate the successes of the British Arms in Indostan," was written to glorify the establishment and expansion of British rule (or the British raj), and modern readers will likely find it rather politically incorrect in places. Like many imperial children of his generation, Orme was convinced of the superiority of Britain's culture, political systems, and military prowess. By comparison, many of the characteristics of India's culture come across as ignorant and barbaric in Orme's book. For example, in his "Dissertation of the Establishments made by Mahomedan Conquerors in Indostan" (which was attached to the *History of the Military Transactions . . .*), Orme calls the Hindu religion "nonsense" and "a heap of the greatest absurdities" and the Indian caste system odious. He also claims that Indian art contains "no ideas of taste or fine design" and posits that Indians are too delicate and gentle to defend themselves, as evidenced by their history of being conquered, first by the Muslim Mughals and later by Europeans led by the British.

Nevertheless, for its time, *History of the Military Transactions . . .* was a remarkable book in many ways. Orme's work was one of the very first histories of the British East India Company and thus was a trailblazing account. Though his judgments would often not suffice for an objective sociologist today, Orme was a keen observer and takes great care to describe the particulars of Indian culture, religion, and political scene accurately and in detail. For example, as pointed out by Robert Travers in *Ideology and Empire in Eighteenth Century India: The British in Bengal*, Orme noted how the Mughal conquerors used existing Indian social and political institutions, especially the caste system, to expand and solidify their rule, much as the British did in the eighteenth and nineteenth centuries. Orme also used as many native sources as he could find, not content to rely on solely European accounts, and

➤ HOLWELL'S BLACK HOLE OF CALCUTTA

The Black Hole of Calcutta has left a lasting image in the national memory of Britain since the 1750s. The Black Hole itself was a military jail, a temporary place of confinement, for negligent or criminal sepoys and other East India Company troops located deep in the back of a garrison barracks in Fort William (in Calcutta/Kolkata), the fortified settlement of the British East India Company in Bengal. On the night of June 20, 1756, 146 British residents and others were rounded up and placed in the Black Hole jail after the fort had been successfully overrun by the forces of Siraj ud-Daula, the *nawab* of Bengal. The next morning, June 21, reportedly only 23 of the original 146 prisoners survived the ordeal in a cell that was 18 by 18 feet (5.5 by 5.5 meters) though some writings report it to be just 18 by 14 feet. John Zephaniah Holwell, a member of the company's Council and a revenue collector and magistrate, famously memorialized the incident in his so-called letter to a friend, published in 1758, with the long title "A genuine narrative of the deplorable deaths of the English gentlemen, and others, who were suffocated in the Black-Hole in Fort-William, at Calcutta, in the Kingdom of Bengal, in the night succeeding the 20th day of June, 1756, in a letter to a friend." Recently, historians have questioned the veracity in the reported number of deaths in the Black Hole.

—John Pincince

his research methods and abilities were impressive. His description of the Mughal conquest and European intervention reads like an epic and is grand in its sweep. His accounts of the various conflicts of mid-eighteenth-century India are rich in detail and anecdote and are impressively comprehensive. Finally, for every negative he ascribes to the indigenous Indians, there is a corresponding admiring comment; for his time, Orme was quite open-minded. To Orme, Indians were hardworking, peaceful, gentle, joyful, and astoundingly productive, especially given their (in his opinion) lack of technology and mechanical sense. In addition, though Orme lists a number of Indian failings, he is quick to note that there are many individual exceptions to be found. Thus, Orme did not necessarily hold that members of an entire "race" were all the same.

Through these earnest attempts at cultural relativism, Orme marks himself as a product of the eighteenth-century Enlightenment.

Orme's work was enthusiastically received by contemporary Britons, heady with patriotic imperial fervor from British successes in India and North America, and it underwent several editions and reprints. Perhaps the most notable aspect of Orme's book, however, is its endurance. Scholars still reference *History of the Military Transactions* . . . today as a well-written accurate work that provides a gripping account of a key period of early modern Indian history.

The Rise of Prussia

The development of the Hohenzollern realms, mostly centered on the German state of Mark Brandenburg in the mid to late seventeenth century, into the dynamic and robust state of Brandenburg-Prussia (henceforth to be referred to as Prussia), was mostly the work of Frederick William, the “Great Elector.” Brandenburg had been held by the House of Hohenzollern since 1415 along with the right to elect the Holy Roman emperor (and hence the title of elector). In the midst of the Thirty Years’ War (1618–1648), Frederick William assumed possession of the Hohenzollern realms, namely Brandenburg; various scattered holdings in northern Germany; and the territory of Prussia (in his capacity as Duke of Prussia as a Polish vassal) in the Baltic region. In relation to the expanse of the rival state of Habsburg Austria, these were small holdings for an emergent German state. In spite of these challenges, Frederick William was able to extract taxes and a viable military force from his holdings while

building a modernized bureaucratic absolutist state based on the economic and social subservience of Junkers (Prussian aristocracy) and serfs.

Frederick William built the Prussian state on the premise that a permanent standing army was his upmost priority. In the context of the Thirty Years’ War, his standing army of 8,000 men, while small in relation to the other major powers, had been effective in battle and in clearing his family lands of foreign troops. In 1648 at the Peace of Westphalia, the settlement formally ending the Thirty Years’ War, Frederick William acquired more lands for Brandenburg-Prussia, most notably the adjoining territory of eastern Pomerania and the city of Magdeburg. However, in spite of the end of the Thirty Years’ War, Frederick William continued to campaign in other European conflicts, switching sides when it appeared that he had the most to gain. By 1688 Prussia had a standing military force of 30,000 troops.

Frederick William understood that he would not be able to finance a professional standing army through his own funds and thus established a system of taxation to exact funds from the Junkers, estates, and towns. In 1653 he struck a compromise with the Junkers whereby they would accept his permanent tax for his army and he would recognize their social and economic privileges vis-à-vis the serfs. In this arrangement, Junkers would have little say in the administration of the realm, but the arrangement recognized that only they had the right to own land and evict serfs at their whim, and they also had immunity from taxes (once this army tax expired). Moreover, Frederick William established a strong central government, centered around the *Generalkriegskommissariat* (military commissariat) that collected taxes, promoted state industries, managed the logistics of the military economy, and eventually supervised the state economy. In the midst of these economic developments, some 20,000 Huguenot refugees from France and the western Holy Roman Empire migrated to Brandenburg, forming an integral part of the emergent textile industry in that region. With the expiration of the army tax on the Junker class, the Prussian state subsequently extracted most funds from the towns and the peasantry, using or threatening military force when it was necessary to coerce payment.

The Prussian army became the central institution of the Prussian state and society under Frederick William's regime. The Prussian military was pivotal to his absolute control over society. From all the Hohenzollern territories, Junkers staffed the officer corps while the peasantry formed the rank and file, thereby reinforcing already rigid social and economic stratification in Prussian society. This meant that for Junkers, an officer's commission became an integral element in his social position in the aristocracy, which reinforced his authority over his peasants, who were also his soldiers. Moreover, it firmly established a military hierarchy within society with the Prussian monarch at the apex (always a Hohenzollern), followed by the Junker officer class and the peasant-soldiers.

Frederick William was succeeded by his son, Frederick III, elector of Brandenburg (r. 1688–1713), who assumed the title “King in Prussia” (which was outside of the Holy Roman Empire) in 1701 as Frederick I of Prussia. This arrangement was done in exchange for an alliance with Habsburg Austria, whose archduke was also Holy Roman emperor, against Bourbon France in the War of the Spanish Succession (1701–1714). Frederick William I (r. 1713–1740), also known as the soldier-king, built on the legacy of his grandfather and further centralized the control of the Prussian state by reforming the civil service, establishing public schools, and implementing changes in the military that increased its efficiency in its administration and in battle. He was succeeded by Frederick II (r. 1740–1786), also known as Frederick the Great of Prussia.

Frederick II of Prussia, regarded by contemporaries and historians as a pivotal figure in Prussian history, ruled over a far more homogeneous and uniform state than his predecessors. Moreover, his embrace of warfare led to the acquisition of vast territories in Silesia at Polish expense. His military exploits in the War of the Austrian Succession (1740–1748) and the Seven Years' War (1756–1763) made him one of the ablest military commanders of the European Great Powers of that time. Furthermore, Frederick II also presided over more bureaucratic reforms within the Prussian civil service, the drastic modernization of the state military, and infrastructural improvements in the

➤ PRUSSIA AND POLAND—REVERSAL OF ROLES

Prussia's diplomatic relationship with Poland began as one of a minor Hohenzollern margrave (the military governor of a mark), serving as a vassal of the Polish king, and ended with one in which the Prussian king took part in the dismemberment of what was left of Poland in the Polish Partition of 1795. Since 1466 Poland had held Prussia as a vassal state, which had been granted to the margrave of Brandenburg as a dukedom by the Polish king. This arrangement lasted well until 1701, when Frederick III of Brandenburg assumed the title “King in Prussia.” This was done so as not to offend the Polish Crown while assuming the trappings of royalty for the Prussian Hohenzollerns within the Holy Roman Empire, of which Prussia was not a part (but Brandenburg was). However, the Polish Crown had effectively lost control over its territories, partly due to the fact of the immense power of the nobility vis-à-vis the monarch. As a result, Poland lost vast amounts of its territory in the three partitions (1772, 1793, and 1795) of its territories to tsarist Russia, Hohenzollern Prussia, and Habsburg Austria, effectively turning its former German vassal state into its master.

—Abraham O. Mendoza

Hohenzollern territories. Frederick II built on the political and military successes of his predecessors to further establish Prussia as a European Great Power, which while not on par with Britain, France, Russia, and Austria was nonetheless a force to be reckoned with in the context of international relations and the European balance of power system. Moreover, the Hohenzollerns established the primacy of the military and state in the quotidian existence of Prussian society, which would carry over into nineteenth- and twentieth-century greater German society.

■ Introduction: Wars of Colonial Expansion

The European Age of Expansion initiated prolonged wars between European states over colonial possessions. As the volume of international trade increased so did trade's relative importance for a state's economy. Protecting colonies and overseas trade became part of geopolitical considerations. European naval advantages—the powerful technological combination of full-rigged, stoutly built ships carrying large effective cannons and handling large payloads—allowed European ships to force their way into local trade networks in Asia, Africa, and the Americas. In the early 1500s, the Portuguese used their naval technological advantage to defeat Muslim navies in the Indian Ocean and take control of sea lanes; a century later, the English, French and Dutch did the same. Although Asian states possessed sophisticated naval technology that equaled or in some cases (e.g. China's treasure ships) eclipsed European technology, Europe's naval activity was a result of complex socioeconomic factors that Asian (or African) states struggled to replicate. More importantly, most non-European states were land-based empires and had little interest in the seas or in overseas colonies. China could have posed a major obstacle to European naval expansion in the Indian Ocean but was preoccupied by other concerns and overlooked its importance. With the exception of the Ottoman empire, no state navies challenged Europeans on the sea.

European colonial rivalries had momentous consequences. Outside the Americas, Europeans pursued their colonial interests by establishing coastal entrepôt empires, a series of trade outposts connecting far-flung regions via sea-lanes. By the eighteenth century, control of the sea-lanes became a key national interest for many European states and contributed to the formulation of a new type of war, the *guerre de course* (war against commerce) that entailed harassment of the enemy's merchant shipping and attacks on its colonies. Such a focus on the need to control the seas, at a time when the rest of the world was inland looking, meant that by the mid-eighteenth century European states, particularly Britain, exercised unrivaled mastery of the high seas.

European colonial conflicts can be traced back to the Portuguese exploration of the fifteenth century when the Portuguese mariners discovered the islands of Madeira, Azores, and Cape Verde, and established outposts along the African coastline and India. Portuguese successes led to Spanish-funded expeditions by Christopher Columbus to explore an alternative route to Asia. The subsequent discovery of the Americas caused competing Spanish and Portuguese claims to undiscovered lands. The Treaty of Tordesillas (1494) sought to mitigate tensions between the two European states by dividing the world outside of Europe in an exclusive duopoly between the Iberian kingdoms along a north-south meridian. Although this opened virtually all of the Americas to Spanish colonization, the Portuguese successfully challenged Spanish dominance in South America where Portuguese colonies mushroomed on the Brazilian coast.

At the same time, the Portuguese achieved considerable success in the Indian Ocean where Dom Afonso de Albuquerque, the first viceroy of India, took advantage of European military superiority to conquer local cities and establish Portuguese control of the seas. In 1661, in the midst of a war against Spain, Portugal granted England access to its Indian possession, marking the start of the English presence in the subcontinent. By the seventeenth century both Iberian kingdoms faced great threats to their colonial interests from the Dutch, the English, and the French. These early colonial conflicts were driven by the newly invented joint public-private ventures, private companies formed to trade with colonies that soon claimed trade monopolies. The ships of the famed English, Dutch and French East India Companies played a crucial role in maintaining the spirit of rivalry and competition among the European states. Thus, by the seventeenth century, England and the Netherlands challenged Portugal's monopoly of trade with India and successfully tapped into the lucrative spice trade. Yet, the intense rivalry between English and the Dutch companies soon led to a series of Anglo-Dutch wars (1652–1654, 1665–1667 and 1672–1674) in which the Dutch triumphed over

EUROPEAN COLONIAL POSSESSIONS BY 1648

the English despite losing the colony of New Netherland in North America. The Netherlands' more advanced financial system allowed it to secure a strong position in Asia and to remain the world's dominant trade nation until the turn of the eighteenth century.

More consequential were colonial wars involving Britain, Spain, and France. Between 1450 and 1775, Britain and France fought at least a dozen wars, the most important of which were the War of the Spanish Succession (1701–1714) and the Seven Years' War (1756–1763). These wars developed a global character as Britain and France clashed over colonies in North America, the Caribbean, and the Indian Ocean. Ultimately, Britain triumphed over its archrival; and the Treaty of Paris, which ended the Seven Years' War in 1763, ended France's position as a major colonial power in India and North America. Less

decisive was the outcome of the Anglo-Spanish rivalry in which Spain successfully repelled British attacks during the Anglo-Spanish Wars of 1727–1729 and of 1739 after losing a few Caribbean colonies, most notably Jamaica, in the mid-seventeenth century.

Pepper Wars—The Struggle for the Spice Islands

European commercial and colonial expansion into India, Ceylon, and Oceania, beginning in the fifteenth century, centered on the trade in nutmeg and mace of the Spice Islands (known to contemporaries as the Moluccas Islands), located in present-day Indonesia. Throughout much of the seventeenth century, Portuguese, Dutch, English, and French forces were engaged in a

A scene in Batavia, Java, Dutch East Indies, shortly after its founding in 1619. (The Print Collector/StockphotoPro)

► THE STRUGGLES FOR CEYLON (1638) AND MALACCA (1641)

In 1505 Portugal founded various settlements in Ceylon (present-day Sri Lanka) to ensure their domination of the international spice trade. Through Ceylon, Portugal had access to trade from and into the various Indian principalities of southern Asia, gaining much wealth for the Portuguese merchant class. However, by the mid-seventeenth century Dutch incursions into southern Asia and Oceania threatened Portuguese economic domination of the region. By 1658 after Dutch naval and military operations had gradually ousted Portuguese settlers and merchants, Portugal was forced to cede Ceylon to the Dutch.

In 1511 Portuguese forces conquered Malacca (present-day Malaysia). Portugal founded a colony there, resulting in the development of Malacca as an important colonial center for the international spice trade. After the fall of Malacca to Portugal, the sultanate of Johor and the sultanate of Aceh vied with Portugal for control of the Straits of Malacca, a crucial route for trade in the Indian Ocean. Portuguese military successes ensured their control of this important trade route. However, the Portuguese lost their fort at Malacca in 1641 to the Dutch due to waning Portuguese power in the Indian Ocean after a century of decline.

—Abraham O. Mendoza

fierce struggle for control of these islands—Ran (in the Banda Islands), Halmahera, Seram, Buru, Ambon, Ternate, Tidore, the Aru Islands, and the Kai Islands, among others—that were crucial to the spice trade and to access to trade with India, Japan, and China. Commercial expansion into these regions also created alliances, trade relationships, and colonial impositions with neighboring Asian states for the Europeans. Through the auspices of joint-stock corporations and the development of international trade networks, the Dutch, Portuguese, French, and English were able to penetrate the region economically and politically while squabbling over who got the biggest piece of the pie.

Before 1500, Italian domination of Mediterranean trade ensured that they had ready access to spices provided by international commercial networks with southern Asia and Oceania through their Arab allies and the overland spice routes. Seeking to end Venetian and Genoese domination of the spice trade spurred Portugal to discover a direct sea route to the Indies. From 1497 to 1498 famed Portuguese navigator Vasco da Gama sailed successfully around the Cape of Good Hope and up the eastern coast of Africa to Malindi (present-day Kenya) and from there to Calicut (present-day India). Da Gama's expedition allowed Portugal to seize control of the spice trade between India and Africa from the Arabs and Persians and to hold a monopoly for a century, until the Dutch entered the scene. This monopoly enabled Portugal to keep the price of pepper artificially high in Europe, as they took advantage of growing European demand.

After the Spanish took over Portugal in 1580, Portuguese colonial possessions became fair game for the Dutch, who were fighting a war of independence from the Spanish Habsburg monarch Philip II. The Dutch war effort included opposition against Spanish expansion across the globe, and so the Dutch sent expeditions to the East Indies early in the seventeenth century. By 1700 they had driven out the Portuguese and prevented English incursions, ensuring their trade links with India.

In 1619 a Dutch military garrison was established at Batavia (ironically appropriating the name for the Netherlands when it was a Roman

province), which became the headquarters of the Dutch East Indies Company (VOC) in the East Indies. The VOC was a joint-stock company, politically and economically influential back in the Netherlands, and its directors attempted to protect their investments and the company's control of the region through military force, political alliances, and economic domination.

The Dutch took advantage of their monopoly in the Spice Islands by restricting supplies and destroying large numbers of crops to create artificial scarcity in order to drive up prices. However, during the eighteenth century the British and also the French became determined to break the Dutch monopoly on the spice trade and penetrate the region themselves. By 1796 Britain had taken over territories throughout the East Indies, employing military tactics and economic incursions that the Dutch were unable to resist. French expansion into the region was curtailed, however, as the British expelled them from the East Indies during the Seven Years' War (1756–1763), limiting them to territory (Karikal and Yanaon) on the Coromandel coast, Pondicherry, Mahé on the Malabar coast, and Chandannagore in Bengal on the Indian subcontinent. The growth of British commercial interests in South Asia, particularly that of the English East India Company, made control of the Spice Islands crucial to their ambitions. However, in 1824 Britain signed a peace treaty that ceded much of the East Indies to the Dutch, with the exception of northern Borneo, while holding Ceylon, Malaya, and vast tracts of India. This strategy of dividing the world, or slicing the melon as European imperialism was later called, ensured British economic domination of India while relegating the Dutch to content themselves with possession of what subsequently became known as the Dutch East Indies.

The Campaigns of Afonso de Albuquerque

Afonso de Albuquerque was the true founder of the Portuguese empire in India, making it the first modern colonial empire. Despite many failures and opposition from his comrades, Albuquerque pursued a successful strategic plan. He recognized that holding certain strategic fortified ports, along with Portuguese control over commercial shipping, would result in command of the Indian Ocean. Albuquerque's forces were always outnumbered by his opponents, but decisive tactics, ruthlessness, and determination enabled Albuquerque to overcome great odds. He also used divisions in Indian society to find local allies in his campaigns.

Albuquerque served against Muslims in North Africa before his first voyage to India in 1503. On that trip he helped install a Portuguese ally as king of Cochin. Albuquerque also supervised the building of a Portuguese fort at Cochin, one of the first permanent Portuguese outposts in India. Although Albuquerque returned to Portugal in July 1504 with a valuable cargo of spices, his exploits showed that he was a capable commander who would not put his own interests above those of the Portuguese Crown. As a reward, King Manuel I gave Albuquerque command of 5 of the 16 vessels that sailed from Portugal in 1506. Furthermore, Manuel entrusted Albuquerque with a commission as governor of Portugal's Indian possessions when Dom Francisco de Almeida's term as governor expired.

Unlike Almeida, Albuquerque adopted a strategy of gaining permanent control of locations where trade routes came together. By forcing native merchants to deal with the Portuguese and by destroying Muslim rivals, he believed that Portugal could gain wealth and power out of proportion to its military forces. During the voyage to India in 1506, Albuquerque and Tristao da Cunha destroyed Arab cities along Africa's east coast. They parted company after capturing the island

► CONQUEST TRIGGERED BY FEAR—PORTUGUESE ACCOUNTS OF THE CAPTURE OF GOA

Goa became the chief outpost of the Portuguese empire in the Indian Ocean. Halfway up the west coast of India, Portuguese squadrons could easily reach most shores of the Indian Ocean from Goa. The city also served as a terminus for goods produced in western India that would then be shipped to Persia, Egypt, and markets farther west.

According to Albuquerque's *Commentaries* as well as near-contemporary accounts by Joao de Barros and Diogo Couto and by Fernao Lopes de Castanheda, Albuquerque did not intend to capture Goa in February 1510. Instead he planned to attack Hormuz or Aden. After leaving Cochin the fleet met with Timoja, a Hindu pirate allied to Albuquerque. Timoja told Albuquerque and his captains that the ruler of Goa had died and that the people hated his successor. When Albuquerque seemed reluctant to act, Timoja also warned that many Turks and Mamelukes were in Goa preparing a fleet to attack Portuguese bases. The threat from the Turks and Mamelukes was very serious, since the Portuguese feared their state-of-the-art weapons and ship technology.

Albuquerque's captains insisted that he attack Goa to forestall the Muslims. Albuquerque reluctantly agreed. After probing attacks succeeded, the Portuguese and their allies launched an all-out attack that easily took the city.

Officially Albuquerque claimed that he only captured Goa in 1510 because he was afraid of the future danger it offered. However, evidence indicates that Albuquerque used fear to win support from his captains. His attack on Hormuz in 1508 failed because his captains mutinied. Just a month earlier Albuquerque had unsuccessfully attacked Calicut. His use of fear as a motivating factor may have been intended to gain general support for a plan he had formed months before.

—Timothy J. Watts

of Socotra, at the entrance to the Red Sea. Albuquerque hoped that an outpost at Socotra would choke off Muslim commerce traveling through the Red Sea. He next attacked Hormuz in the Persian Gulf. The island controlled trade between Persia and the Indian Ocean. Albuquerque was

driven from Hormuz before he could establish permanent control.

Almeida refused to turn over command to Albuquerque when he arrived at the end of 1508. In February 1509 Almeida won the decisive Battle of Diu, destroying Muslim naval power. In November of that year Portuguese reinforcements confirmed Albuquerque's appointment, and Almeida departed. The commander of the reinforcing ships and men brought orders to attack Calicut. The attack in January 1510 miscarried, and Albuquerque was badly wounded.

Albuquerque's determination to succeed now showed itself. He massed 23 ships and 1,200 Portuguese at Cochin by the end of January and spread the rumor that he was going to attack Hormuz again. After consulting with local Hindu allies, however, Albuquerque attacked Goa. Goa was a Hindu city located halfway up the western coast of India. The city was on an island isolated from the mainland by saltwater streams. The Muslim ruler of Goa, Yusef Adil Shah, had recently died, and his successor was inland, fending off incursions by his neighbors. A sudden descent on Goa by Albuquerque's forces captured the city on March 1. A counter-attack by the new ruler, Ismail Adil Shah, drove the Portuguese from Goa, but the fleet was trapped in the harbor. Although Adil Shah offered to give Albuquerque land for a fortress, the governor refused anything less than all of Goa. Faced with starvation and mutiny, Albuquerque finally sailed from Goa on August 4, 1510.

Incredibly, Albuquerque returned in November 1510 to attack Goa again. His army numbered around 3,000 men, including Indian allies, and soon drove out the 8,000-man garrison left in Goa. Most of the Muslims in Goa were killed, and Albuquerque soon established new fortifications to defend the city. Goa became the capital of Portuguese India.

Campaigns against other Muslim powers quickly followed. The rich city of Malacca was captured in 1511, despite an overwhelming numerical superiority for the defenders. Hard fighting followed to defend Goa during August and September 1512, since the Muslim cannons and other weapons were the technical equals of the Portuguese ones. Albuquerque was conspicuous

in exposing himself to the enemy's fire when his men wavered. The successful defense of Goa caused many states around the Indian Ocean to open friendly relations with the Portuguese.

In February 1513 Albuquerque led an expedition against Aden, at the entrance to the Red Sea. Aden was the western terminal for trade in the Indian Ocean, just as Malacca was the eastern terminal. With approximately 2,500 men, including 800 Indian auxiliaries, Albuquerque tried to take Aden in a sudden attack but was driven off with heavy losses. He then led the first Portuguese expedition into the Red Sea, where he toyed with the idea of capturing Jidda, the port for Medina and Mecca. Later chroniclers claimed that Albuquerque considered trying to steal Mohammed's body and hold it for ransom, along with diverting the Nile River to devastate Egypt. In the end the Red Sea expedition came to naught, and Albuquerque was forced to return to Goa in August 1513 with little to show.

Albuquerque's last campaign was against Hormuz, which had resisted him in 1508. His forces landed on the island in March 1515. In a masterful but ruthless ploy, Albuquerque invited Hormuz's young sultan and his chief minister to a meeting. Although both sides were to be unarmed, Portuguese soldiers seized the minister and killed him. The intimidated sultan placed himself under Albuquerque's protection. To secure the Portuguese position, Albuquerque built a fortress to control the harbor. During this time he contracted a form of dysentery, which left him in a weakened state. On his way back to Goa he received word that he had been replaced as governor by Lopo Soares de Albergaria, a bitter enemy. Albuquerque died at Goa in December 1515.

The Spanish Regime in the Philippines

The permanent Spanish presence in the Philippines began in 1565 with the arrival of Miguel Lopez de Legazpi. His forces built a fort on the island of Cebu, where Magellan had landed almost 40 years earlier. A problem the Spanish colonists faced until the seventeenth century was sufficient food, as the local population engaged in subsistence farming and did not have enough for the influx of the Spaniards, modest though their numbers were. Reinforcements and supplies arrived from Mexico in 1566, 1567, and 1571, enabling the Spaniards to take Manila, located on the island of Luzon. Luzon was the trading center of the archipelago as well as an outpost of the Muslim sultanate of Brunei on the northern coast of Borneo.

Manila was taken on May 19, 1571, without bloodshed, and Legazpi proclaimed it as the capital of the islands on June 3, 1571. From there expeditions were sent out to explore as well as conquer the rest of the island of Luzon. For the most part much of the archipelago was taken with little bloodshed, leading to the myth of the easy or bloodless conquest of the Philippines. In reality the Spaniards were not able to subdue the population in various parts of the Philippines, such as the Muslim areas in the south and the Cordillera mountain range in northern Luzon. But in those areas where they "conquered" the local population, in reality they simply made arrangements whereby the local leadership would stay in place and work in conjunction with Spanish authorities.

Several factors should be kept in mind when considering the Spanish regime. First, the number of Spaniards was never large, certainly not large enough to maintain control over the local population. In fact, most Spaniards never left the Manila area. Second, control was maintained with the help of local leadership and the missionary friars. Third, the Philippines failed to live up to Spanish expectations for direct economic rewards, namely indigenous precious metals, spices, and similar raw materials, but they became an important commercial entrepôt. The Manila Galleon became the economic lifeline

➤ WHO IS A FILIPINO?

As in Latin America, the indigenous population in the Philippines was referred to as *indios* (Indians) or *naturales de la tierra* (natives of the land). That they were called *indios* was a carryover of Columbus's mistaken idea that he had reached the Indies. The term "Filipino," at least prior to the Philippine Revolution, therefore did not refer to the local inhabitants. In the Spanish world, a peninsular was a Spaniard born in Spain, a *criollo* one born in the Americas, and a Filipino a Spaniard born in the Philippines. Such distinctions were important to the Spaniards for social and political reasons. The peninsulares believed that any association with the local population tainted Spaniards, especially those who were unfortunate enough to be born in the Philippines, including the fact that they had been

raised with significant help from local women and had grown up with significant contact with the non-Spanish population. When reading Philippine history, it is important to keep these distinctions in mind. For example, when Miguel Lino de Espeleta became the first Filipino archbishop of Manila in the second half of the eighteenth century, the significance was not that a member of the indigenous population had risen to such a rank—for this would not happen until the twentieth century—but that a Spaniard born in the Philippines had done so. It was in the late nineteenth century, as the local population struggled for liberty, that they came to own the term "Filipino" as referring to the people of the archipelago.

—Damon Woods

of the Spanish population in Manila. Europeans were not allowed to enter China, and thus Manila provided a site where Spaniards could trade with Chinese merchants. A single ship, one of the so-called Manila Galleons, which were owned by the Spanish Crown, would bring silver and chocolate from Mexico, while 30 to 40 Chinese junks would bring silk and porcelain for trade. These Chinese goods would then be brought back to Mexico, often for transshipment to Europe.

As to the governance of the local population, the local inhabitants, as legal minors, were to be protected by the Spanish authorities. In terms of administration, the *indios* were treated as a separate commonwealth known as *la república de los Indios*. This commonwealth had its own code of laws and magistrates. While the physical reorganization (*reduccion*) of Philippine society into a system of manageable towns and villages has been emphasized by some, the reality is that there was strong continuity from pre-conquest to postconquest political structure in the islands. Needing the established leadership to work with them to collect taxes and keep the local population under control, the Spaniards made the position of local chief, the *datu* (or *datto*), hereditary and tax exempt, giving the *datu* incentive to collaborate. They further gave them the title *cabeza de barangay*, or head of

the *barangay*. Since Philippine society lacked the structure suitable for being governed by the Spanish authorities, the Spaniards took what was a rarely used Malay-derived social term, *balangay*; corrupted it into the term "barangay"; and made it the basic political unit over which the *cabeza de barangay* had authority.

Spanish legislation and Filipino responses led to the following geographical structure. The archipelago was divided into provinces with one major city, the capital. Municipalities, or townships (*pueblos*), consisted of the town proper (*poblacion*), villages (barangays, or barrios as they came to be known), and small hamlets (*sitios*). The head of the *pueblo* was known as *gobernadorcillo* and was an elected official. *Cabezas* were officials over the various barrios. In the mid-eighteenth century a proposal was made to take the duty of tribute collector from the *cabeza de barangay* and to have an elected official collect tribute. The idea was not enforced, but the notion of an elected *cabeza de barangay* did go into effect. The hereditary succession was abolished and replaced with elections, with the winner serving a minimum of three years. During his term in office the *cabeza* was exempt from paying taxes, and if he served more than ten years, he was exempt for life. In addition, new offices had emerged, including the *fiscal*, a position held in connection with the church in town.

It is worth noting that local officials often participated in revolts against Spanish authorities well into the eighteenth century. However, the Spaniards were generally able to win them over, as indeed the officials had much to lose if a revolt failed. But in the nineteenth century the revolts began to be led by peasants, those who were not part of the political structure and had little to lose if they failed.

English Seafaring during the Sixteenth Century

As an island kingdom, England always had close ties to the sea, and its ports boasted experienced seamen and navigators. The English, however, came late to the exploration game. During the first wave of European expansion, the Treaty of Tordesillas (1494), which was repeatedly renegotiated, had divided the New World between Portugal and Spain with the pope's blessing. When King Henry VII of England sanctioned John and Sebastian Cabot's voyages to the New World, he urged his seafarers to find routes not already claimed by the powerful Spanish. As a result, English seamen tended to focus on possible northern passages to the riches of the East.

The Cabots did reach the New World, but their voyages sparked little interest or profit. Although Henry VIII is sometimes credited as the father of the Royal Navy, he was not concerned with exploration. By the mid-sixteenth century, however, private enterprise filled the void left by the state. A commercial contraction at home persuaded English seamen and merchant adventurers to invest more of their capital in the risky business of overseas expansion. From the 1550s onward, they sought charters from the Crown

that granted them regional trade monopolies and formed a number of new joint-stock companies to trade with far-off regions: the Muscovy Company (1553) sought trade with Russia, the Guinea Company (1555) looked to Africa, the Eastland Company (1579) concentrated on trade with the Baltic, and companies were also formed to trade with the Levant (1592) and the East Indies (1600).

Beginning in the 1560s, English seamen directly challenged Iberian hegemony in the New World and the East. Seamen such as John Hawkins hoped to fill a niche in established global trade networks, but Spanish authorities saw them only as unwelcome interlopers and heretics. While Hawkins's early voyages to Africa and the New World yielded very tidy profits (especially from the slave trade), Spain cracked down on this unsanctioned trade with its colonies during Hawkins's third disastrous voyage (1567-1569). The Spanish attack at San Juan de Ulua captured most of Hawkins's men and fleet; however, the two ships that managed to escape held Hawkins, the future architect of the Elizabethan navy, and his kinsman, Francis Drake, as the future scourge of Spanish ambitions at sea. The incident at San Juan de Ulua convinced English seafarers that it would be necessary to pry open New World trade through force.

British ships under Sir John Hawkins are surprised and defeated by a Spanish fleet off San Juan de Ulua, escaping with great losses and returning ruined to England, 1567. (Mary Evans Picture Library/The Image Works)

► SCURVY

The disease scurvy, associated with seafarers since ancient times, is caused by a lack of vitamin C (ascorbic acid). Early symptoms include lethargy and depression. Patients experience growing irritability, swelling of the gums, loss of teeth, and easy bruising. After one to three months, those afflicted experience shortness of breath and bone pain. Eventually this condition will result in death if untreated.

Although scurvy afflicts the land population, it is most readily associated with seafaring: an enhanced risk of scurvy went hand in hand with the growth of long-distance voyages during the first wave of European expansion. Many seafarers relied on a diet lacking in fresh fruit and vegetables. For example, during Vasco da Gama's voyage to India in 1497–1498, scurvy killed two-thirds of the crew.

During this first period of global expansion, there were many theories, most incorrect, about what caused scurvy. The notion of vitamins and balanced diets was unknown. Some sixteenth-century seamen connected scurvy and diet and discovered that citrus fruit was a cure. Despite John Woodall's assertions in *The Surgeon's Mate* (1617) and James Lind's research on oranges and lemons as a remedy in the mid-eighteenth century, dietary change was slow in coming. While British sailors picked up the nickname of "limeys" for stocking citrus for long voyages, the so-called plague of the sea that affected all nations was not conquered until the end of the eighteenth century.

—Cheryl A. Fury

English forays into Spanish sea-lanes incited a cold war during the 1570s, and England's plundering of Spanish ships and colonies sparked more heated exchanges during the 1580s. The aggressive actions of the English sea dogs and the not-so-circumspect support of their queen, Elizabeth I, earned the ire of King Philip II of Spain. Drake's attacks on Spain's possessions and Elizabeth's support of the Dutch rebellion against Habsburg rule strengthened Philip's resolve to send an impressive armada of ships against the "enterprise of England."

The English victory over the Spanish Armada in 1588 was much heralded at the time,

but it did not end Spanish designs on the island kingdom. Intermittent and inconclusive naval campaigns continued, and neither side was able to bring the struggle to a successful end. The conflict between England and Spain continued through 1604 after both Elizabeth I and Philip II were dead. Privateering (legalized piracy against enemies of the state) was in many ways the most consistent of England's efforts against Spain.

Elsewhere, English expeditions met with mixed results. Drake's circumnavigation in 1577–1580 (the second European expedition to accomplish the feat) demonstrated impressive seamanship. The Cathay Company's support of Martin Frobisher's voyages reinvigorated the search for a Northwest Passage to the East during the 1570s. These voyages did not yield much in the way of returns, and the company folded. John Davis made three additional attempts to search out the elusive passage. Judged unsuccessful at the time, these voyages did much in terms of exploring what is now the Canadian north.

Nor were the English as adept in their initial colonial enterprises as they were at trade and plunder. Colonies begun in the late sixteenth century, such as Roanoke, failed but paved the way for more successful attempts in the seventeenth century. Nonetheless, the developments of the sixteenth century established a foundation for later British sea power and empire.

The Dutch Regime in Indonesia

The Dutch first came to Indonesia during the era of the great chartered companies. After 1595 several smaller Dutch companies, known as *voorcompagnien*, began heading for Aceh, Banten, and the Moluccas. In 1602 they were united and gained a charter as the United Dutch East India Company (Verenigde Oostindische Compagnie, or VOC). This company gradually became the predominant power in Indonesia until the demise of the VOC in 1799.

The primary interest of the VOC was spices, in particular pepper from India and Sumatra, cinnamon from Ceylon, and, most profitably, cloves, nutmeg, and mace from the Moluccas. Consequently, the first VOC voyages headed for the Spice Islands, as the Moluccas were named at the time. The principal aim was to monopolize the spice market. In order to enforce their interests against indigenous suppliers and European competitors in that field, the Dutch followed a radical course of action. This course had no limitations as to the costs of the campaigns or on the use of violence.

The islands of Ambon, Ternate, and Tidore were the main suppliers of cloves in the seventeenth century, and were forced by threat of violence to guarantee exclusive market access to the VOC. On Ambon the VOC was able to establish territorial control, while the sultans of Ternate and Tidore were monitored by fortified factories. In 1623 the Dutch destroyed the tiny English factory on Ambon and executed its personnel, finally expelling the English from the Moluccas. Banda, the only supplier of nutmeg in the far south of the Moluccas, was conquered in 1621. The island's population either died in the genocide committed by the Dutch or was forced into slavery. The company delivered the nutmeg gardens to Dutch entrepreneurs, who cultivated them with imported slaves. In order to defend their monopoly on the Moluccas, the Dutch carried out armed naval operations (*krijstochten*) against indigenous traders blamed as "smugglers" and undertook costly raids to destroy any "illegal" clove plantations (*exstirpatien*). Concerning the Moluccan spices, the VOC was quite successful, but it did not succeed in preventing all clandestine trade. Concerning pepper, the

market structure proved to be too differentiated to successfully monopolize the commodity.

Under the Portuguese, the Southeast Asian spice trade was organized by emporia, export-oriented port cities and forts built in order to ensure a Portuguese monopoly over the trade in Asia. The VOC needed to gain control over the growing areas and also over these redistribution centers. Thus, the company conquered the most important port cities in cooperation with local allies (Malacca in 1641, Macassar in 1667, and Banten in 1682) and reorganized them as Dutch colonial towns under the administration of company officials. In principle, the VOC preserved the Portuguese structure of the Southeast Asian port cities by controlling trade and requiring the indigenous merchants to arrange for Dutch permission if they wanted to trade in company-controlled ports.

➤ A COLONIZATION PLAN, 1623

During the period of establishment, some United Dutch East India Company (Verenigde Oostindische Compagnie, or VOC) officials briefly debated whether to form a settlement colony in Indonesia like the Spanish in Latin America. Governor-General Jan Pietersz Coen himself submitted a plan to the company's directors suggesting long-term settlements of Dutch farmers in the Malay archipelago. He knew that such a project largely depended on guarantees for free private trade. According to his plan, they could attract settlers in Indonesia by allowing the free trade of all commodities except spices, the sacrosanct core business of the company. Additionally, Coen suggested a deficiency guarantee of the state. While Coen's settlement plans aimed for a sustainable basis of the Dutch presence, the investors in the Netherlands were more concerned with short-term assets. This became one reason for the failure to establish a colony. Other reasons were the government's disinterest in providing financial support and the considerable lack of interested settlers, especially females. This lack of Dutch women eventually led to an alternative colonial society based on marriages between Dutch men in the company's service and Indonesian women.

—Jürgen G. Nagel

Along with Batavia, founded in 1619 by Jan Pietersz Coen, this network of colonial towns served as the backbone of the Dutch regime in Indonesia. Batavia itself became the administrative and economic center of the VOC and it concentrated the majority of the regional and transregional trade in Batavia's harbor. In contrast, the other ports were controlled mainly for prohibitive purposes. In many smaller port cities, especially on the northern coast of Java, the company established informal control; residents passed the main state revenues to the VOC, giving these towns a semicolonial character. Thus, the Dutch profited from a significant part of the regional trade even though they did not control the pepper or textile trade as effectively as the Moluccan spice trade.

The company commanded limited military and naval resources. Thus, it was not able to secure a dominant position in all parts of the widespread Malay archipelago. Indigenous allies were indispensable. On the political level, the Dutch developed a network of contractual partners to whom they delegated the duties of control. Although those contracts were signed between sovereign partners, they usually were unequal in character in that they favored the Dutch. They offered protection to local rulers and, in return, expected support for the suppression of "illegal" commercial activities. The relationships varied in relation to the importance of the partners and the residents' ability to enforce agreements. Thus, the different contract situations varied from close military alliances to relations without any practical relevance. On the commercial level, the VOC preferred cooperation with trade diasporas, especially the Chinese who sustained trade connections to imperial China and advanced to become the leading population group in Batavia. In contrast, the company suppressed Indonesian merchants who were accused of undermining the Dutch monopolies and threatening the company's core business.

The VOC did not strive for a formal colonization of Indonesia but instead subordinated any territorial interest to commercial aims. This is reflected in the methods by which they founded or conquered colonial towns and even in the company's largest colonial possessions on Java. While the immediate surroundings of Batavia

came under direct control and were mostly cultivated by Chinese entrepreneurs, the VOC exploited internal conflicts between the Javanese states in the rest of the island. Mataram, in central Java, especially made substantial concessions to the company. The so-called Chinese War (1741–1743) strengthened Dutch indirect rule because the company defeated several Javanese leaders who tried to organize a revolt of Chinese coolies in the sugar industry. During its last decades the VOC used colonial control to introduce new cash crops like coffee. Thus, the VOC laid the foundations for the colonial state of the nineteenth century.

Even if the VOC developed a multifaceted image in the Malay archipelago, all its efforts were centered around the company's core activities: the trade of profitable Asian commodities. The Dutch combined market monopolies in the growing areas of the most important products, control over strategic port cities, a policy of alliances, and modest colonial influence. The result was a hierarchical Batavia-centered system characterized by a high degree of local autonomy due to scarce resources, communication problems, and the varying economical or strategic relevance of the different colonies. This system reached its economical peak in the 1680s. Nevertheless, its administrative structure laid the first foundation stone of the Dutch Indies as a colony.

Russian Expansion into Siberia and Central Asia—Yermak the Conquerer

No name is as strongly associated with Russia's extraordinarily rapid and complete expansion eastward from the state of Muscovy into Siberia in the sixteenth century than that of the Cossack *ataman* (chieftain) known simply as Yermak. Muscovy's expansion from a small city-state to the center of a new Russian state had begun much earlier with the so-called Gathering of the Lands, reuniting the Russian states of Kievan Rus that had been decimated and scattered by the Mongol invasions in the thirteenth century. By the sixteenth century, however, the Gathering of the Lands was complete, and Russians were expanding beyond the area formerly claimed by Kiev. Driving the conquest were two irresistible motives: the search for security and the quest for riches. Added to this was opportunity. While to the north, south, and west Russia was hemmed in by dense populations and powerful states (such as Sweden, the Ottoman Empire, and the Polish-Lithuanian Commonwealth), to the east the vast frontier that stretched to the Pacific Ocean was sparsely populated by disunited and nomadic tribes. Once the formerly great khanate of Kazan (in southwestern Siberia in central Asia) was defeated by Russian armies under Ivan IV (Ivan the Terrible) in 1552, the way was open for the Russians. Many historians, such as Russian historian Nicholas Riasanovsky and global historians William McNeil and Peter N. Stearns, have pointed out that Russian exploration and conquest of Siberia paralleled the activities of the conquistadors from southwestern Europe in the New World in roughly the same period and with many of the same consequences: wealth for the conquerors, tragic destruction for the conquered.

Despite the lack of large-scale organized resistance, conquest of vast spaces in harsh climatic conditions that ranged from the permafrost of the

tundra to temperatures easily over 100 degrees Fahrenheit in the desert was no easy matter. Russian explorers and conquerors made good use of the extensive river system—"the roads that run" as Russians sometimes called them (including, in Siberia, the great Ob, Yenisei, and Lena rivers, together with their tributaries)—to travel far distances in short time periods. Searching primarily for furs, they concentrated on the taiga (forest) region north of the 50th parallel. The fabulously wealthy Stroganov family, with the explicit permission of the tsar himself, sent out explorers and trappers, followed closely by the official state military and administration. Among the more famous of these adventurers are Ivan Moskvitianin, who reached the Pacific in 1639, and Semen Dezhnev, who, with a handful of men and small boats, in 1648 sailed from the mouth of the Kolyma River through what would much later come to be known as the Bering Straits, at the tip of Siberia.

The scattered native tribes (Chukchi, Yukagirs, Yakuts, and many others) could either submit to conquest and pay tribute (usually in the form of animal skins)—and hope for concessions to their leaders—or face brutal suppression. Their relatively small numbers as well as their heterogeneity and disunity doomed them in any case to domination by the Russians. Yermak became the most well known of these daring yet brutal conquerors.

Yermak, sometimes also referred to with a patronymic as Yermak Timofeyevich, had been an outlaw *ataman* among the Volga and Don Cossacks (a traditionally troublesome group for

Yermak's Conquest of Siberia in 1582 by Vasily Surikov, 1895. (State Russian Museum, St. Petersburg, Russia/The Bridgeman Art Library)

the Russian state) and a pirate on the great Volga River. In the 1570s, however, Yermak joined those hired by the Stroganovs to provide protection and defense for their explorers and trappers. Yermak rapidly rose to prominence in the early 1580s when he successfully defeated a major khan of western Siberia, Khan Kuchum, and turned all of his territories over to the tsar for the collection of tribute. For the next four years Yermak continued the work of conquest and expansion, developing a reputation for extraordinary daring and accomplishment along the way. He is said to have died in battle, reportedly drowned while attempting to escape capture swimming across the Wagay River dressed in heavy chain mail, a gift from the tsar himself.

While the initial lure of Siberia lay primarily in its ample supply of furs, Siberia turned out to yield far more riches than the first conquerors, such as Yermak, could even imagine. Despite extreme difficulty in extracting them, diamonds, timber, and minerals such as iron, gold, salt, and oil have all contributed to making Siberia incalculably valuable to the Russian state into the present day and beyond.

Contesting the Sugar Islands— The Franco-British Wars in the Caribbean

Spanish domination of the Caribbean kept the British and French from founding colonies there until the early 1600s. Several of the first new colonies planted there—Barbados and Jamaica, for instance—were founded in the 1620s to grow tobacco. Originally, planters sought indentured servants from Europe or enslaved Native Americans as the labor supply for this back-breaking work in challenging conditions but soon turned to enslave

Africans as the least expensive and most dependable labor force. When the tobacco market collapsed in the 1640s from overproduction in the Chesapeake, the planters experimented with other crops, such as indigo, but found limited success. By the 1670s, however, sugar growing and refining had become the islands' most important industry. European demand for sugar grew quickly. Because a successful harvest required large investments in machinery and African slaves to work the fields, the British and French colonies became dominated by large plantations with several hundred slaves. Income from sugar brought wealth to the producers and shippers, even while thousands of slaves died every year.

Beginning in the wars of the 1600s, the European powers sent expeditions to try to capture rival colonies or to protect their own. The geography of the Caribbean required naval squadrons to protect or capture the islands. Operations were complicated by disease and weather. Yellow fever quickly decimated armies and ships' crews. The threat of hurricanes usually limited naval operations between June and November. Even so, the value of the so-called sugar islands in the Caribbean was too great to ignore. Even in peacetime, pirates were a serious threat to unprotected shipping.

During the War of the League of Augsburg (1688–1697) and the War of the Spanish Succession (1702–1714), British and French forces each seized several islands, but British control over St. Christopher was the only permanent result. The War of the Austrian Succession (1740–1748) also produced little effect on the balance of power in the Caribbean.

By the 1750s France's Caribbean islands were its most valuable colonial possessions. They supplied most of the sugar used in Europe, providing needed income for the French government. When the Seven Years' War broke out, Britain used its naval superiority to attack the French islands. An amphibious attack on Martinique in 1758 was unsuccessful, but the British captured Guadeloupe in February 1759. Martinique and most other French Caribbean islands fell in 1762. The French Navy was unable to protect the islands because of a stifling British blockade. The Treaty of Paris confirmed British possession of Dominica, St. Vincent, and Tobago, but

Martinique and Guadeloupe were returned to the French in exchange for Canada.

Many in France hoped for revenge. Their opportunity came with the American Revolution. After secretly helping the Americans, the French formally entered the war in 1778. The major fighting at sea took place in the Caribbean. The Royal Navy had been neglected after 1763, and worldwide British commitments meant that the French could usually match British forces in the region. In September 1778 a French landing force captured Dominica. The British responded by capturing St. Lucia in December. In 1779 the French captured St. Vincent and Grenada. The only naval battle that year ended in a draw.

During 1780 Admiral George Rodney fought several inconclusive battles with French squadrons. He captured several Dutch islands but no French possessions. He sailed for home in early 1781, leaving Admiral Samuel Hood in charge. Hood was challenged by a large French squadron under Admiral François de Grasse. French forces captured Tobago and St. Eustatius during 1781 before leaving for Virginia and Yorktown.

While the fighting in North America wound down in 1782, decisive battles took place in the Caribbean. In February 1782 the French captured St. Kitts. The decisive Battle of the Saints took place on April 12, 1782, near Dominica. Rodney, again in command, broke with traditional sailing order and led his ships through the French line of battle. The French lost seven ships of the line. The victory preserved British honor and salvaged their possession of some islands in the Caribbean. The Peace of Paris in 1783 returned most of the British islands to them including the Bahamas, which had been captured by the Spanish in 1782.

The final war between Great Britain and France over the Caribbean sugar trade took place during the French Revolution. The question of citizenship caused destabilization on St. Domingue by 1791, leading to a slave uprising. The outbreak of war and a British blockade prevented France from sending assistance to the settlers. British forces captured Martinique but were unable to take the other French possessions despite pouring half of the nation's military expenditures into the Caribbean during the 1790s. When the Peace of Amiens was

An engraving from 1749 of a West Indies sugarcane refinery, an industry made possible by the plantation system and slave labor. (Library of Congress)

signed in 1802, French regulars tried to regain St. Domingue but failed due largely to an outbreak of yellow fever that cut their forces in half. Victorious blacks established their own republic and renamed it Haiti.

The sugar imports from the Caribbean declined rapidly during the nineteenth century due to the development of a beet sugar industry in Europe. The sugar plantations also became politically untenable following a general rejection of slavery during the 1800s. The importance of the sugar islands declined correspondingly.

Early Modern Maritime Empires and Expansion

Although there were numerous maritime empires before the early modern period, the era saw the creation and expansion of sea-based

➤ IMPERIAL DENMARK

The largest and most global of the minor European empires was that of Denmark. Even before Europe's age of maritime expansion had begun, Denmark exerted control over Norway (theoretically an equal partner in a union of Crowns but in practice subordinated to Denmark), Iceland, and the Faeroe Islands in the North Sea and possessed a strong maritime tradition. Greenland, although its earlier European settlers had abandoned it or died out, was still claimed by the Danish ruler in his capacity as king of Norway. Greenland was resettled from 1721. Although nowhere a dominant colonial power, Denmark had global reach, with the sugar slave plantation colonies of the Danish West Indies (St. Thomas, St. John, and St. Croix) in the Caribbean, Iceland, and Greenland in the North Atlantic, Tranquebar and other small colonies in India, including the Nicobar Islands, and Fort Christiansborg (in modern-day Ghana) and other slave-trade bases on the Atlantic coast of Africa. Tranquebar, on the southeastern Indian coast, was considered the capital of Danish India, was founded by the Danish East India Company in 1620, and was the first base for Protestant missionaries in India.

—William E. Burns

empires on an unprecedented global scale. These empires were based on west European states, by far the most important being Portugal, Spain, England, France, and the Dutch Republic, with Denmark, Sweden, Brandenburg, and the German-Polish principality of Courland playing minor roles. Although expansion rested on European maritime technology (including items like the magnetic compass that had originated elsewhere but had been adopted by European seafarers), Europeans were not invincible at sea. At the same time that these new empires were being built, an older European maritime empire, the Mediterranean empire of Venice, was slowly retreating before the land-based Islamic empire of the Ottoman Turks.

The most striking difference in the expansion of the new maritime empires was that between the Old World (Europe, Asia, and Africa) and the New World of the Americas. The technological

and disease advantages that Old World societies held over Americans made it relatively easy to establish territorial dominions, whether by subjugating the indigenous population in the Spanish fashion or expelling them in the English fashion. Afro-Asian societies were much better able to defend themselves and were often able to restrict European imperialists by mutual agreement to designated trading areas such as Macao in China, Nagasaki in Japan, and the slave trade outposts of the west African coast. As a result, the Portuguese and Dutch empires in the Indian Ocean were more empires of trading posts than territorial empires. France, England, and particularly Spain combined trading posts with large territories, mostly in the Americas, over which they exercised direct control. These territories, unlike the trading posts, could accommodate large-scale European settlement. By the eighteenth century there were about 3 million or 4 million European immigrants and European-descended people living in the Americas, about 5 percent of the population of Europe. Not all of these immigrants came from the colonial powers. Italian merchants and bankers were found in the Spanish colonies, and Germans were ubiquitous in the mining industry. The vast majority of new arrivals to the Americas were not European immigrants but rather African slaves.

Expansion did not merely include territory on land. It also included claims to control seas, as the Portuguese claimed to be lords of the Indian Ocean, while the Spanish claimed to be lords of the Pacific and the Caribbean. Such claims, which implied the exclusion of foreign commerce, were difficult to fully enforce. Fishing rights were also vigorously contested, particularly in the North Atlantic cod-fishing grounds.

A variety of forces pushed maritime expansion. Available wealth took many forms, from the gold and silver of Mexico and Peru to the furs, tobacco, and sugar of America and the spices and manufactured luxuries of Asia. Much early Spanish expansion was driven by land- and gold-hungry nobles, the “conquistadors,” essentially military entrepreneurs with only a loose relationship to the Spanish Crown. The French, Dutch, and English often formed companies that brought together merchants and investors under state sponsorship to found colonies

or expand colonial trade. Examples include the Vereenigde Oost-Indische Compagnie of the Dutch Republic (VOC, Dutch East India Company), the English East India Company and Virginia Company, and the French Compagnie de Nouvelle France. The spreading of the true faith was a particularly strong motivation in the Catholic empires of Spain, Portugal, and France, which could draw from the dedicated celibates of Catholic religious orders. Protestant missions, originally marginal, became a more active force in expansion in the eighteenth century. Encouraging colonization by dissident religious groups such as the Pilgrim Fathers of Plymouth colony or the Quakers of Pennsylvania was an English specialty with few successful parallels in the other empires. Strategic conflict among European states—the rush to claim territory before a rival state—also led to expansion.

Colonies often developed a certain autonomy. The slowness of communications between decision makers in Europe and colonies meant that local leaders had room for a great deal of initiative. The VOC, not the Dutch government, was the effective representative of Dutch policy in the Indian Ocean. Spanish and English American colonies in particular developed a strong sense of their own interests, which sometimes led to conflict with the imperial government. Local leaders could initiate hostilities against Native Americans or colonies of rival powers with little check from distant governments in London or Madrid. The tendency over the course of imperial history was for the state to play a more prominent role in colonial administration, particularly as warfare in colonial theaters became more central to European power struggles.

Habsburg Spain as a World Empire

Spain under the Habsburg dynasty (1516–1700) became the first global power. Unlike many other empires that were built more gradually, like the Russian or British empires, the vast majority of the Spanish empire was built in a frenetic burst of activity stretching from Christopher Columbus's first voyage in 1492 to Pedro de Valdivia's founding of Santiago de Chile in 1541. In that time Spain explored, conquered, and settled the Caribbean; conquered and annexed the territories of the two most powerful American empires, the Incas of Peru and the Aztecs of Mexico; and established itself as the dominant power in Italy with control over Milan in the north and Naples in the south. Spanish forces also conquered Mers-el-Kebir and Oran in northern Africa, although plans to establish a north African empire were never successfully implemented. Although Spanish power continued to slowly expand from its initial New World bases, there were relatively few major acquisitions after this period, the most important being Florida, the conquest of which began in 1565, and the Philippines, named for Spanish ruler Philip II (r. 1556–1598), in which a Spanish presence centered on the town of Manila was established from 1565 to 1570. In Europe, Spain controlled the Low Countries and the Franche-Comte region as part of the inheritance of the dukes of Burgundy.

Two treaties with Portugal, the 1494 Treaty of Tordesillas and the 1529 Treaty of Zaragoza, divided the non-European world into Spanish and Portuguese spheres. The Portuguese empire in coastal Africa, Brazil, and the Indian Ocean was united under a common sovereignty with the Spanish empire when Spain and Portugal had the same rulers from 1580 to 1640. However, the two empires were administratively separate.

The Americas were particularly important to the empire. At its height, it controlled a belt of territory from Chile to what is now the southwestern United States and claimed the entirety of both continents except for Portuguese Brazil. In the Gulf of Mexico and the Caribbean, Spain controlled nearly the entire coast, with the significant exception of French-ruled Louisiana,

► A WAR THAT NEVER HAPPENED—THE SPANISH INVASION OF CHINA

Such was the confidence engendered by the ease of Spanish conquest in the Americas and the nearly bloodless takeover of Portugal in 1580 that some Spanish officials and priests in the Philippines believed that Spain could conquer all of China. Francisco de Sande, the third Spanish governor of Manila, claimed that 6,000 men could conquer the whole Chinese empire. Some who advocated the “enterprise of China,” such as the Macanese Jesuit Francisco Cabral, even argued that conquest could be accomplished using Japanese Christian soldiers rather than Spaniards. The most elaborate plan was put forth in 1586 in a letter signed by all the Spanish officials in Manila and carried to Madrid by the Jesuit Alonso Sanchez. The plan required an army of 12,000 Spaniards, 6,000 Japanese, and 6,000 Filipinos. The plan arrived in Madrid as the government was preparing the Spanish Armada against England and had no time for Chinese plans. In any case, Philip II, more aware of the limitations of Spanish power and the many areas where Spaniards were already engaged than his officials and priests in Manila, rejected such plans in favor of peace and trade with the Chinese.

—William E. Burns

and numerous islands, most importantly Cuba, Jamaica, and Hispaniola. The precious metals of Mexico and Peru were particularly valuable to Spain. In addition to the annual “plate fleets” that sailed from Mexico to Seville, the “Manila galleons” sailed from Acapulco to Manila in the Philippines, where their silver was exchanged for Chinese goods that were then returned to Mexico to be shipped to Spain and sold in Europe. Spain consistently sought to exclude European rivals from the Pacific.

Ideologically, the Spanish empire was identified with Roman Catholicism. This mission justified a variety of struggles, including those against European Protestants, the Islamic Ottoman empire, and the polytheistic societies of the Americas. Church personnel were a vital support of the empire. In the late sixteenth century rulers as geographically and culturally separate as

Elizabeth I of Protestant England and Totoyomi Hideyoshi of Shinto-Buddhist Japan took measures against the Catholic clergy, fearing that Catholicism was a stalking-horse for Spanish power.

Spain faced multiple enemies, several with a global reach including England, France, and the Dutch. The multitude of Spanish commitments frequently strained Spanish finances and manpower resources. The war that more than any other weakened the empire was the Eighty Years’ War (1568–1648) against the Protestant-dominated independence movement in the Low Countries that eventually formed the Dutch Republic in the northern Netherlands, leaving the south or “Spanish Netherlands” to Spain. The Dutch struggle was uniquely destructive because the Dutch both challenged Spain to maintain the “Army of Flanders” in the Netherlands at massive expense and attacked Spanish commerce on the high seas. Even during the Twelve Years’ Truce from 1609 to 1621 there was “no peace beyond the line,” as Dutch raiders continued to assault Spain in east Asian and American waters. The Dutch conflict merged into another conflict, the Thirty Years’ War (1618–1648), that drained Spain of many of its resources and pitted Spain against a coalition of European powers ultimately led by France. The stress placed on the empire by the war led to many revolts against Spain, the most important being the Portuguese revolt that again separated the Spanish and Portuguese Crowns.

Spanish decline in Europe, however, had little effect on the Spanish empire outside Europe. Jamaica was lost to England in 1655, and the western third of the island of Hispaniola was lost to France in 1697, but the vast majority of the empire was retained and even expanded, as Spain advanced on its frontiers with Native Americans in the far north and far south of its American empire.

Bourbon France as a World Empire

France under the Bourbon dynasty (1589–1792) was a latecomer to the empire building of west European states. The Wars of Religion in the late sixteenth century prevented France from devoting much energy to colonization, and early efforts, such as the founding of “Antarctic France” (1555–1567) and “Equinoctial France” (1612–1615) in Portuguese-claimed Brazil and Fort Caroline, a colony of Huguenots in Florida (1562–1565), were crushed by Portugal and Spain. Even after France became a successful empire builder, its imperial agenda was consistently subordinated to its quest for European hegemony. The French colonial empire never became as central to French identity as the British and Spanish colonial empires were to their nations.

The founding of Port Royal in Nova Scotia in 1605 is often considered the foundation date of the French empire. Bourbon France’s imperial possessions were concentrated in North America, the Caribbean, and India, with fortresses on the west African coast, particularly Senegal, for the slave trade and the possession of a few islands in the Indian Ocean such as Mauritius and Ile Bourbon (now known as Réunion). France was the first European power to explore and claim much of the interior of North America, encircling the British colonies on the Atlantic coast to the north and west. The founding of the colony of Louisiana in 1699 with its capital New Orleans at the mouth of the Mississippi cemented French control over North America’s most strategically valuable inland waterway, a control reinforced with an elaborate network of fortifications. North America was the only region in

the French empire to draw significant French settlement but never drew the number of immigrants that the British colonies did. The French position in North America was further strengthened in the eighteenth century through alliance with the Spanish monarchy, occupied by the Bourbon dynasty after the War of the Spanish Succession (1701–1714).

In America, France drew on alliances with indigenous peoples more than did its Spanish, Dutch, and British rivals and, in striking contrast with the British, encouraged intermarriage with Native Americans. The fur trade, the economic lifeblood of French America, depended on cooperation with Native Americans. Native allies also played a vital role in the French colonial military. However, the French also faced opposition

► PIERRE POIVRE, COLONIAL ADMINISTRATOR AND BOTANICAL PIRATE

In the eighteenth century, France turned its island possessions in the Indian Ocean from way stations into profitable plantation colonies. A leader in this effort was Pierre Poivre (1719–1786), a missionary turned colonial administrator who devoted enormous effort to breaking the Dutch East India Company’s control over the spice trade. Poivre traveled in China, Indochina, and other areas of Asia and the Indian Ocean and had observed their agriculture systems as well as France’s. Inspired by the company’s garden at the Cape of Good Hope, Poivre planned to make the botanical garden on Mauritius, established by previous governor Bertrand-François Mahe de La Bourdonnais (1699–1753), a major center of research in economic botany in an effort to identify new crops for the French empire. A major obstacle was the tight control over the spice plants that the Dutch maintained. Poivre launched several clandestine expeditions to smuggle spice plants from Dutch Indonesia and the Spanish Philippines to the French islands. Eventually he managed to obtain nutmeg and clove plants. There was an intense debate between Poivre and French apothecary Jean-Baptiste Aublet (1720–1778) over whether or not the nutmeg plants were the “true nutmeg,” but spice cultivation was effectively established on Mauritius.

—William E. Burns

from the Iroquois Confederacy, the most powerful Native American group in North America. Like the Spanish empire, the French empire was strongly allied with the Catholic Church and drew heavily on Church personnel. French colonies in the Bourbon era were limited to Catholics only, even when Protestantism was tolerated in France itself. In Canada, French power supported Jesuit and Franciscan missionaries who worked both to convert native communities and establish relations between them and France. Catholicism bonded Native American communities to alliance with France rather than with the Protestant Dutch or English.

France's Caribbean colonies, which included Saint Domingue on Hispaniola, Martinique, Guadeloupe, and other islands as well as French Guyana on the South American mainland were important for their economic value. Saint Domingue in particular, with its slave-worked sugar plantations, became a generator of vast wealth for France. France's islands in the Indian Ocean served as way stations for the profitable trade with East Asia, an area where France was increasingly active in the late seventeenth century, but were also developed into agriculturally productive areas. France actively sought to introduce new crops to its colonies to make them more profitable, employing its world-leading scientific institutions to do so.

Bourbon France was destroyed as an imperial power in a series of disastrous eighteenth-century conflicts with Great Britain. In these wars France, as a continental power, was forced to maintain a large army to deal with its European rivals, while Britain, as an island with no territorial ambitions on the continent, could devote a much larger proportion of its resources to its navy and to expeditionary forces. These wars, particularly the Seven Years' War (1756–1763), resulted in the loss of French Canada, Louisiana, and nearly all of French India, reducing the French empire to its Caribbean possessions and a few scattered outposts elsewhere. France's surviving possessions in India and the Caribbean were required to demilitarize. France did not acknowledge this as a permanent defeat and launched a vigorous program of economic development of its remaining colonies and naval building to produce a navy rivaling Britain's

as a global force. The victory of France and its American rebel allies in the War of the American Revolution failed, however, to restore France as a power in the Americas or India.

The Colonial Wars in North America

Violence shaped the European colonization of North America. As a result of mutual fears, cultural misunderstanding, and increasing colonial encroachment on limited natural resources, armed conflict erupted on a regular basis between settlers and indigenous populations. Colonial powers also waged a number of wars against each other as commercial and imperial rivalries played themselves out in the New World.

The establishment and development of permanent settlements during the seventeenth century created tensions everywhere. English colonists fought the Powhatan in Virginia (1609–1646, intermittently); in New England, they confronted first the Pequot (1637) and then the Wampanoag and their allies during King Philip's War (1675–1676). The French who settled in the St. Lawrence Valley waged war against the Iroquois Confederacy (1609–1701, intermittently). Inhabitants of the New Netherlands fought the Lenape (1643–1645, 1659–1663), while Spaniards encountered resistance in Florida and New Mexico, most famously during the Pueblo Revolt (1680).

Through the next century, armed conflict continued to erupt between colonial powers and native nations. English colonists fought the

Tuscarora (1711–1715) and Yamasee (1715–1716, 1727) in the Carolinas as well as the Wabanaki in New England (1723–1727). In what is now Wisconsin, French forces and their indigenous allies waged intermittent war against the Fox (1712–1737); in Louisiana they fought the Natchez (1716–1729, intermittently) and the Chickasaw (1736, 1739–1740). In the American Southwest, a complicated pattern of raiding and trading developed between nomadic peoples such as the Navajo and Comanche and the Spanish and native populations of the Catholic missions.

Beginning in the late seventeenth century, the colonies of Great Britain and France were drawn into what became four major European wars: the War of the League of Augsburg (1690–1697), known to British American colonists as King William's War, was followed by the War of the Spanish Succession (1702–1713), also known as Queen Anne's War; the War of the Austrian Succession (1744–1748), also known as King George's War; and the Seven Years' War (1754–1763), also known as the French and Indian War. Spain, whose colony in Florida neighbored the southern Anglo-American settlements, battled Britain during the War of the Spanish Succession, the War of Jenkins' Ear (1739–1743), and the final phase of the Seven Years' War.

Offensive operations during the first three intercolonial conflicts had consisted in indecisive guerrilla-style raids on frontier settlements and amphibious assaults on seaboard strongholds. The Seven Years' War was of a different sort. Both Britain and France shipped large contingents of regular troops to the colonies and conducted operations, battles, and sieges in the European style. The initial victories went to the French and their allies, but the tide had turned by 1758. The capitulations of the French at Quebec (1759) and Montreal (1760) gave effective control of New France to the British. The Treaty of Paris (1763) formally transferred France's North American possessions to Great Britain. Spain, which ill-advisedly had entered the war in its last stage, agreed to relinquish Florida.

The westward impetus of Britons and Americans in the years following their imperial triumph brought about clashes with local populations. Traders and political agents in the region of the Great Lakes were challenged by a

British forces under the command of General James Wolfe take Quebec, Canada, on September 13, 1759, effectively ending the French and Indian War. (Library of Congress)

multitribal coalition during Pontiac's Rebellion (1763–1766), while settlers in the Ohio Country faced armed resistance during Lord Dunmore's War (1773–1774).

Throughout the seventeenth and eighteenth centuries, ways of making war were shaped by the colonial encounter, as combatants regularly adopted and adapted to their purposes the technologies, tactics, and customs of their friends and foes. Over time European Americans were successful against their native enemies not because of technological or tactical superiority but rather because they faced societies that were politically disunited and often weakened by epidemics. Moreover, colonists benefited significantly from the manpower and military skill of indigenous allies whose interests often overlapped with their own. Though the French relied most heavily on such alliances, the British and Spanish also made use of them at a number of critical junctures.

North America's colonial wars took an immeasurable human toll: the brunt borne by indigenous populations. Many were the victims of battles and massacres; others died from the privations that typically accompany warfare. Captivity was a common experience among survivors. Native peoples regularly integrated European American prisoners into their communities, while the colonists often sold Indian prisoners into slavery. For such men and women

► THE ROLE OF THE IROQUOIS AND HURON

Politically sophisticated and conveniently situated, the Iroquois Confederacy (Haudenosaunee, or Five Nations, later Six Nations) embarked early in the seventeenth century on a wide-ranging offensive against its indigenous neighbors. The French, who sided with their Huron and Algonquin trading partners, soon became another target.

Historians now believe that during this period the Iroquois followed the traditions of the mourning war, symbolically replacing their dead through the capture and adoption of enemies. Vigorous raiding by Iroquois warriors resulted in the disintegration of several large tribal confederacies, including the Huron (Wendat). Increasingly drawn into the French religious and political orbit, a sizable number of the latter resettled near Quebec after the destruction of Huronia (1649–1650). They remained staunch military allies of France.

The Iroquois offensive subsided toward the end of the seventeenth century. While a pro-French faction migrated to New France, most Iroquois remained on their traditional lands and, when the New Netherlands became New York, entered into a lasting alliance with the British. During the subsequent intercolonial wars, factions fought alongside both imperial powers. The Iroquois Confederacy continued to assert its neutrality from 1701 until the Seven Years' War, when it sided with Great Britain.

—Jean-François Lozier

as well as for countless refugees who were displaced and dispersed, one of the war's outcomes was the formation of new social bonds and identities.

Cycle of Conquest—Iberian Expansion into the Pacific

The Pacific Ocean was an enigma to the European mind-set before the sixteenth century. While men such as Marco Polo had ventured to Asia, the journey had been undertaken overland, through the Eurasian landmass, and not by sea. In fact, the Portuguese entered the Pacific Ocean by sea only after the first incursions into India by Vasco da Gama in 1498. Da Gama's arrival in South Asia proved to be the edge that the Portuguese needed to corner the spice trade. Not only was India an important hub in the Asian market, but it was also where the Portuguese gained the knowledge of what lay east: the lands of the Pacific Ocean. This information encouraged them to continue to push east, to discover the source of these all-important spices. In 1509 Diogo Lopes de Sequeira was sent to Malacca in order to negotiate a commercial agreement with the sultan there. Sequeira sallied through Madagascar and stopped in Cochín to hire some Muslim sailors to guide him the rest of the way. His ship sailed through the Bay of Bengal and then went through the straits between modern-day Sumatra and Malaysia before landing in Malacca. Initially the encounter was amicable, and Muhammad, the sultan, allowed Sequeira to establish a factory for trade. However, the Muslim merchants already in Malacca did not appreciate the arrival of a new competitor and convinced the sultan that the Portuguese were up to no good. Muhammad then sent his forces to attack the factory, killing some Portuguese and taking others as prisoners. This prompted Afonso de Albuquerque to arrive in 1511. He freed the prisoners, conquered Malacca, and sent Muhammad into exile. Malacca was a strategic place, as it was the only trading post between India and

► ANTONIO PIGAFETTA AND HIS ACCOUNT OF MAGELLAN'S VOYAGE

Antonio Pigafetta (1491–1534) was an Italian scholar who accompanied Magellan on his voyage to the Pacific. Pigafetta kept a copious journal of all the events of the trip. Since he was one of the few survivors who returned to Spain in 1522, the journal was preserved. The following is the account of the expedition's entrance into the Pacific and the experiences of the crew as they ran out of supplies with no land in sight:

"On Wednesday, 28th November, we left the strait, and entered the ocean to which we afterwards gave the denomination of Pacific, and in which we sailed the space of three months and 20 days, without tasting any fresh provisions. The biscuit we were eating no longer deserved the name of bread; it was nothing but dust, and worms which had consumed the substance; and what is more, it smelled intolerably, being impregnated with the urine of mice. The water we were obliged to drink was equally putrid and offensive. We were even so far reduced, that we might not die of hunger, to eat each piece of the leather with which the main-yard was covered to prevent it from wearing the rope.

These pieces of leather, constantly exposed to the water, sun and wind, were so hard that they required being soaked four or five days in the sea in order to render them supple; after this we broiled them to eat. Frequently indeed we were obliged to subsist on saw-dust, and even mice, a food so disgusting, were sought after with such avidity that they sold for half a ducat a piece.

Nor was this all, our greatest misfortune was being attacked by a malady in which the gums swelled so as to hide the teeth, as well in the upper as the lower jaw, whence those affected thus were incapable of chewing their food. Nineteen of our number died of this complaint. . . . Besides those who died, we had from 25 to 30 sailors ill, who suffered dreadful pains in their arms, legs, and other parts of the body."

—Monique Vallance

Adolfo Caso, *To America and around the World: The Logs of Christopher Columbus and Ferdinand Magellan* (Boston: Branden Books, 2001), 258.

the China Sea. The Portuguese presence in Malacca was established not to disrupt the trade but rather to profit from it. Therefore, the Portuguese did not raise the customs duties originally set by Muhammad. In this region the Portuguese were not interested in controlling the people but instead wanted to control the trade. Forts were built for the purpose of eliminating their rivals so they could dominate the area.

Two months after Albuquerque conquered Malacca, he sent out two of his lieutenants, Antonio de Abreu and Francisco Serrão, to make contact with other islands, namely the Bandas and the Moluccas. It was possible to make this round trip only once a year, as the monsoon winds blew east for only a certain amount of time. Abreu had more luck than Serrão with spices, as he returned with a boatload. Even though Serrão did reach the Molucca Islands, his ship wrecked on an uninhabited island. The crew was saved when a pirate ship landed to investigate the scene, and Serrão's crew managed to hijack the

ship and escape. Although Serrão did not return to the Moluccas, more Portuguese did land and dominated the trade as well. Over the next few decades the Portuguese constructed more forts around the East Indies but more to protect against Spanish incursion than to control the natives. Although the Portuguese traded with the rest of the islands in the region, they only established one more permanent trading station on the island of Timor (part of present-day Indonesia). Their bases in the islands allowed the Portuguese to establish trade in China and Japan as well.

Spain's introduction into the Pacific started from a different direction. Rather than approaching from the east as the Portuguese had, the Spanish entered from the west. The first Spanish explorer to traverse into the Pacific Ocean was Vasco Núñez de Balboa when he crossed the Isthmus of Panama in 1513. The settlement of Panama was then established in 1519, but it would be many years before the

Spanish concentrated on settling the Pacific coast. Because the Spanish nationals were busy attempting to find their fortunes, it was instead Portuguese subjects who explored the Pacific Ocean in the service of the Spanish Crown. In September 1519 Ferdinand Magellan left Spain with five ships and headed westward. The journey was a hazardous one. They sailed the expanse of the Atlantic before reaching Rio de la Plata in January 1520, where one of the ships mutinied. They traveled through the straits in Argentina, a 38-day voyage with harrowing winds, and came out into a tranquil ocean that they dubbed “the Pacific.” Unfortunately the happiness at reaching a calmer ocean vanished, as their supplies ran out. It took 14 weeks before they finally landed in Guam on the verge of starvation. However, the natives stole from them, causing them to call the archipelago the “Ladrones,” or the “Thieves.” A subsequent stop in the Philippines established the Spanish presence there but also caused Magellan’s death, as he was killed during battle with the natives. The two surviving ships west the Philippines and attempted to make the trip home. One sailed east across the Pacific, but the headwinds were too strong, and the ship was forced west again. The second ship sailed west and was successful in rounding the Cape of Good Hope to finally reach Spain in September 1522. The first ship eventually returned, leaving 13 survivors of the original 265 who set sail in 1519. Besides being the first expedition to circumnavigate the globe, it also gave the Spanish the opening they needed to compete with the Portuguese in the Pacific.

However, this incursion into the Spice Islands was not as profitable as Charles V had hoped. Several expeditions sailed into the Pacific, but they were all disasters. In addition, the Treaty of Tordesillas had ceded Asia to Portugal, and the Portuguese king was upset by the Spanish presence there. Finally, Charles signed the Treaty of Saragossa (1529) in which he renounced all claims to the Spice Islands and the agreement that Spanish ships would not venture west of the Molucca Islands in exchange for 350,000 ducats. Several more independent incursions came out of Spain in the next 40 years, but none were successful. The Portuguese bases

were too strong and all too easily blocked these rogues. Finally in 1564, Miguel Lopez de Legazpi sailed to the Pacific at the request of Philip II. Legazpi eventually landed on the island of Cebu, in the Visaya Islands, and it proved to be a strategic port for them. Philip had instructed Legazpi to use as little violence as possible in order to avoid the problems that had occurred in the Americas, but Legazpi was forced to use violence nonetheless in order to put down native resistance. In the end the Spanish focused mainly on the Philippines, although this was a continuing challenge. The threat of Chinese pirates was ever present, and the lack of slaves on the island made it difficult for the colonists to feed themselves, let alone produce raw goods. The Spanish Philippines only existed based on the financial assistance it received from Mexico, even down to the nineteenth century.

In the end, even though the Portuguese strongly dominated the Pacific throughout the sixteenth century, that dominance ended by the end of the century. The union of the two Iberian countries spelled a downfall for the Portuguese empire in Asia, as the various wars fought by Spain took men away from protecting that area. In addition, the rebellion of the Dutch gave them the freedom and incentive to attack the Spice Islands. Eventually they gained a foothold by the beginning of the seventeenth century, and 100 years later they had fully ousted the Portuguese despite the fact that the Portuguese had regained their independence in 1640.

Vitus Bering and Russia's Pacific Exploration, 1725–1742

By the end of the seventeenth century, Russia had conquered most of Siberia, from the Ural Mountains to the Pacific Ocean. The new territories were as yet barely known much less systematically surveyed, mapped, or colonized. In addition, as the explorers and conquerors moved to the northeastern tip of Siberia, important questions arose. Given the vast distances and long, slow travel from Moscow or Saint Petersburg overland to the Pacific coast, could a sea route that was not iced over be found? How far from Siberia were the Americas? Could Russia not claim northwestern America for itself? Tsar Peter I was eager to learn the answers to these questions, as he hoped to discover vast new sources of wealth to help support his expansive and costly ventures for the Russian state. Consequently, in the early 1720s as the Great Northern War with Sweden that had consumed so much of his attention and Russia's resources for the previous 20 years ended, Peter looked for ways to intensify Russian exploration and exploitation of Siberia and beyond into the Pacific.

On December 23, 1724, a matter of days before his death from pneumonia after a boating accident, Peter signed orders to the Russian Admiralty to send a Russian expedition to Kamchatka to undertake exploration of the Siberian coastline to the north. His successor, Tsarina Catherine I, fulfilled Peter's plans. The man chosen to lead the expedition was Vitus Jonassen Bering (1681–1741), a Dane who had served in the Russian navy with distinction throughout much of the Great Northern War. Bering was known to be a captain of wide experience and proven talent, although he was not familiar with the northern Pacific. In 1725 he set out with members of his expedition (including carpenters, blacksmiths, and coopers) to travel to Kamchatka and build two seagoing vessels with which to carry out his explorations. Traveling through dense forests and marshes, with little to no help from either the local authorities or central authorities, it took them more than two years just to reach their destination. They then built a ship, the *St. Gabriel*, and in July 1728

prepared to leave Kamchatka with a crew of 40 men and enough food for one year and head northeastward along the coastline in search of America. Bad weather, poor visibility, and a coastline that seemed clearly to bend westward prevented Bering and his crew from discovering the northwestern coast of the Americas as they sailed twice (to and from) through the narrow straits that later would become known as the Bering Straits. However, the presence of driftwood not indigenous to Siberia and birds flying east seemed to indicate that land was not too far off in that direction. In 1729 Bering sailed back south to Okhotsk and from there returned overland to Saint Petersburg to make his report.

Shortly after his return, Bering indicated to the new Tsarina Anna his desire to continue his explorations, specifically along the Arctic coast, with the objectives of both mapping it and finding a passable waterway to the Pacific. This already ambitious plan mushroomed into a massive undertaking that would fulfill Peter's dreams: to map not only the Arctic coast but also to discover the route to America and chart the northern Pacific and its islands all the way down to Japan. Ultimately, the intention of the Second Kamchatka Expedition, as it was modestly called to throw off suspicious and competitive European powers, was nothing less than to claim the entire northern Pacific, including the northwestern American coast, and all its wealth for the Russian Empire.

Not surprisingly, in light of its ambitious nature, this expedition, which later came to be called the Great Northern Expedition of 1733–1742, was the largest such undertaking by far up to that time, involving over 3,000 men and requiring multiple teams and complex planning, all of which Bering presided over. Despite enormous difficulties posed by both nature (Arctic conditions) and man (including inadequate funding from Saint Petersburg, lost ships, feuds among the crews) and the death of Bering himself on December 8, 1741, from scurvy and what was called “gas gangrene” of the intestines, the expedition succeeded in most of its goals. With its conclusion, much of Siberia and the northern Pacific and the entire Arctic coastline had been charted and mapped; northwestern America

was reached from the east; an infrastructure for the colonization of Siberia had been laid (with the construction of rudimentary towns, administrative offices, iron foundries, salt works, ports, and supply depots, etc.); and traders, craftsmen, peasants, exiles, and others began to come (or were coerced) to populate the new and distant lands of the Russian Pacific.

British Exploration in the Pacific

While the Spanish had begun exploration and colonization of the Pacific as early as 1520 with Ferdinand Magellan's circumnavigation of the globe and the Dutch had begun exploration in the early 1600s, English navigators did not engage in significant exploration of the Pacific until centuries later. The great exception was Sir Francis Drake. The hero-adventurer-pirate from England had already made a name for himself attacking

Sir Francis Drake, sixteenth-century English explorer, after a portrait by Samuel Lane. (Library of Congress)

Spanish possessions and shipping in the Caribbean. In 1578 Drake passed through the Strait of Magellan and into the Pacific on a top-secret mission to both devastate Spanish shipping and possibly discover the western entrance to the as-yet-elusive Northwest Passage. After raiding several ports and taking many prizes from the unprotected and unprepared Spaniards, Drake sailed up the western coast of North America. He may have traveled as far as present-day British Columbia. Finding no passage, Drake sailed west, stopping first at an island that might have been Palau and then heading to Ternate in the Moluccas before heading back to England.

Although several other attempts to raid Spanish shipping were made, it was not until more than a century later that another English captain made substantial progress in the Pacific. In 1739 with the outbreak of the War of Jenkins' Ear between Spain and England, George Anson attempted to repeat Drake's Pacific exploits against Spanish commerce. Although the journey was fraught with hardship, he too would eventually circumnavigate the globe, exploring the Marianas Islands, especially Tinian, en route

➤ ANSON AND SCURVY

George Anson fully expected to devastate Spanish holdings in the Pacific in even more spectacular fashion than had Sir Francis Drake. Anson left England for his martial voyage in 1740 with nearly 2,000 men and eight ships. When he returned three years later, he had only one ship and just over 500 of his original crew. Although storms and battles with the Spaniards had taken some toll, nearly 1,000 of his men had died of complications resulting from scurvy, a disease caused by severe vitamin C deficiency that leaves those afflicted prone to life-threatening infections. In part because of this disaster, great steps were taken to change the diets of British sailors by introducing leafy greens and citrus fruits. Such was the revolution that among James Cook's sailors 25 years later, not a single man died of the disease.

—Gerrit Dirkmaat

to Macao on his homeward voyage. Several decades later in 1765, John Byron sailed west from South America and charted and landed on several islands in present-day French Polynesia, the Gilbert Islands, the Marianas Islands, and the Marshall Islands. Two years later the English made their first landfall at Tahiti when Samuel Wallis anchored there in 1767. The most important English explorer of the period, James Cook, landed in Tahiti in 1769 on a mission to make astronomic measurements that would aid in the understanding of longitude. Cook also circumnavigated New Zealand and charted the eastern coast of Australia. On subsequent sailings he discovered various islands and made the first European landfall on the Hawaiian Islands, where he died in an altercation with native islanders.

Despite the knowledge of the area that Cook's voyages secured, the British were relatively late European arrivals to the Pacific, and British extension of imperial power to the area

followed rather slowly. However, by 1788 a penal colony for British convicts, many of them Irish, had been established in Australia. Another penal colony was established on the island of Tasmania in 1803. By 1829 the whole of the Australian continent had been claimed by Britain.

■ Introduction: Europe's Wars of Religion

Many historians interpret the European wars of religion as a struggle between dynastic states. Yet Europe's age of religious strife must be characterized also in two ways: first, as the struggle between the Catholic majority and the religious minorities and second, as a manifestation of the contest between nations to assert political and military dominance. Most of Europe's dynastic leaders attempted to centralize their governments during this period, and many engaged in imperial conquests including invasion and colonization to accomplish their ends. Religious grievances provided justification for widespread violence and aggressive domestic policies. Consequently, nearly all of Europe was, at one point or another, engaged in the wars of religion.

When Charles V became the Habsburg Holy Roman emperor in 1519, he ruled over vast lands, including French Burgundy, the Netherlands, Austria, and Aragon and Castile. The Valois king of France, Francis I, formed an

alliance with Pope Clement VII and Henry VIII of England to counter Charles V. The Habsburg-Valois Wars were mainly concerned with checking the power of the Holy Roman emperor, and they were concluded with the Treaty of Cateau-Cambrésis in 1559. The advance of the Ottoman empire also posed a threat to the Habsburgs during this period but was halted in 1571.

About the time of the ascension of Emperor Charles V, the Protestant Reformation broke out. Martin Luther, unsatisfied with the dogma and administration of the Catholic Church, posted his Ninety-Five Theses on the Wittenberg church door in 1517. Luther developed a doctrine of salvation by faith alone and directly challenged Catholicism. Protestant movements began under Ulrich Zwingli and John Calvin, among others, and their immense popularity greatly troubled the Catholic population of Europe. Luther and Calvin did not advocate violent resistance against those who persecuted the followers of the Protestant faith; the early years

► THE ST. BARTHOLOMEW'S DAY MASSACRE, AUGUST 24, 1572

Considered by many historians to be the watershed of the French Wars of Religion, the St. Bartholomew's Day Massacre intensified the conflict between Protestants and Catholics and also radicalized Huguenot resistance-right doctrine. The assassination of the Protestant Gaspard de Coligny, the admiral of France, triggered a series of bloody events, most notoriously the massacre of August 24, 1572, that were to characterize the remainder of the wars.

Influential Catholics such as Catherine de Medici and the powerful Guise family feared that Coligny exerted too much influence over Charles IX. Meanwhile, the Peace of Saint-Germain (August 8, 1570), which offered moderate toleration to France's Huguenots, was under attack as more Catholics came to believe that the toleration of a heretical sect undermined both the state and the faith.

Coligny was in Paris to attend the wedding of Henry of Navarre and Marguerite when an assassin's shot wounded him. He decided to remain in Paris with a detachment of soldiers, but in the early morning of August 24, a Catholic holy day, the king's guard, led by the Guise and other Catholic noblemen, burst into his residence and murdered him and his bodyguards. Coligny's body was mutilated, dragged through the streets, and finally hung from a gibbet; his head was removed and sent to Rome.

Coligny's grisly murder triggered a month-long massacre of Parisian Huguenots by the king's soldiers, neighborhood militias, and armed nobility. Charles IX, whom many Protestants suspected of having a pivotal role in the death of Coligny, could not bring the slaughter under control. Not all Catholics approved of the massacre, and some provided shelter for the Huguenots who fled Paris,

but most approved of the violent steps taken to destroy the Protestant community.

Historians consider the bloody violence against men, women, and children during the St. Bartholomew's Day Massacre as a purging of religious tensions. Catholics expected to destroy the Huguenot threat through humiliation and desecration. They torched homes; engaged in sexual violence, thievery, and pillaging; and mutilated bodies, dumping them into the Seine as a crude reenactment of Catholic baptism. In the end, 2,000 Huguenots were murdered in Paris, and more than 30,000 were massacred in the provinces.

The St. Bartholomew's Day Massacre had a profound effect upon the Huguenot population. Many abjured their faith and returned to Catholicism out of fear, while others fled to lands more tolerant of Protestantism. And many became more willing to confront Catholic persecution directly and to defend their faith through violence.

—Breanna S. Griego

of the Reformation were less radical than they could have been. The Peace of Augsburg (1555) was accepted by Charles V and granted concessions to Protestantism. Under the principle of *cuius regio, cuius religio*, each prince or ruler could choose Catholicism or Lutheranism, but not Calvinism, as the religion of his kingdom.

Meanwhile, Spain was recognized as the most devout of the Catholic states in the sixteenth century. Philip II was an ardent defender

of his faith, and his powerful navy dominated the seas. The Netherlands, ruled by Spain, had a growing Protestant population. Philip installed the Duke of Alba to replace Margaret of Parma as governor of the Netherlands and suspended their constitutional procedures. The Duke of Alba failed to put down a revolt, and Philip II invaded once again. William, the Prince of Orange and leader of the revolt, became the champion of the Protestant Netherlands. He united both

the Catholics and the Protestants in an attempt to remove Spain from the Netherlands.

Philip II also kept his eye on England, which remained firmly Anglican under Elizabeth I. The Virgin Queen had sent troops to the Netherlands to help in their revolt against Spain. When Elizabeth I executed the Catholic Mary, Queen of Scots, Philip launched the Armada, a fleet of ships determined to remove Elizabeth as queen and to install Philip II as the new king of England. But the Spanish Armada was soundly defeated by the English fleets, and less than half returned to the Spanish ports partly due to stormy weather. In addition, the Treaty of Cateau-Cambrésis (1559) divided Italian lands between Spain and France and left the Spanish Habsburgs as the ruling house in Italy.

In France, the wars of religion (1562–1598) had a profound effect upon the state in terms of the development of constitutionalism and the triumph of absolutism. The Guises, a powerful noble family, saw the toleration of the French Protestants, or Huguenots, as a threat to their dominance in the affairs of the church and the state. Catherine de Medici, the regent for her young son Charles IX, had granted limited toleration to the Huguenots in 1562. But in 1572 she decided to organize an assassination attempt against Gaspard de Coligny, a Huguenot and the admiral of France. Upon his execution, much of the Catholic population lashed out against the Huguenots, and thousands were violently murdered in the St. Bartholomew's Day Massacre (August 24, 1572).

Catholics and Huguenots proceeded to take up arms in violent defense of their faith. When Henry of Navarre, a Protestant, became heir to the throne after the assassination of Henry III (d. 1589), many Catholics were terrified of the possible repercussions. The radical Catholic League appealed to Philip II for military assistance against Henry. Once he ascended to the throne, Henry IV converted to Catholicism and issued the Edict of Nantes (1598), which granted toleration to the Huguenots. Henry was determined to reunite France after the disastrous period of civil wars, and he allegedly stated, "Paris is worth a Mass."

The English Civil War (1642–1648), also known as the Puritan Revolution, was a struggle over constitutional, social, and economic issues.

Parliament claimed to have independent rights and authority. James I defended his absolute power in his work *True Law of Free Monarchy* (1598) and attempted to minimize the role of Parliament. After Charles I was beheaded on January 30, 1649, Oliver Cromwell established the republican Commonwealth. Cromwell initiated a program of strict discipline and enforced the Puritan code of morals. It ended in 1660 when the son of Charles I, Charles II, a skillful politician and gregarious ruler, was restored to the throne. The reign of Charles II saw the revival of the arts and literature that had been suppressed during the Commonwealth, not to mention the reinstatement of monarchical rule.

The Thirty Years' War (1618–1648) was the last of the major wars of religion. Beginning in Bohemia, the war spread throughout Germany, Sweden, and the Netherlands, and nearly every European country was involved to some extent. Although there were shifting alliances and varied goals during the period of the wars, it may be generally described as an alliance of Western powers against the growing influence of the Holy Roman emperor. The Thirty Years' War ended the period of warfare driven by religious passions. The Peace of Westphalia (1648) effectively ended the battles, was an important step toward religious toleration, and marked the beginning of the period of modern statecraft.

French Wars of Religion, the Prelude

By the first half of the sixteenth century, France had recovered from the population losses caused by the Great Plague as well as the political and economic destruction wrought by the Hundred Years' War. Under the charismatic kings Francis I (r. 1515–1547) and Henry II (r. 1547–1559), the French monarchy began reclaiming its power. In 1539 Francis placed all of France under the jurisdiction of royal law courts, facilitating further centralization of authority. The Valois kings of France waged intermittent wars against their rival Habsburgs, but the costs of war proved to be more than the French government could afford. Aside from heavy borrowing and increased taxes, Francis also sought to raise necessary funds through the sale of public offices and improved relations with the papacy. In 1516 he signed the famous Concordat of Bologna (1438), which revised the earlier Pragmatic Sanction of Bourges under which French rulers rejected the papacy's control over the French church and asserted their superiority over the appointment of bishops, thus diminishing the papacy's influence inside the kingdom. Under the concordat, Francis recognized the supremacy of the papacy over the French church but retained the right to appoint all French bishops and abbots, which provided the monarchy with a rich source of money. Signed a year before Martin Luther's Ninety-Five Theses, the Concordat of Bologna proved to be consequential, effectively establishing Catholicism as the state religion. Francis, a rather broadminded ruler, was later unwilling to abandon his advantageous compromise with the Catholic Church. The French monarchy's efforts to centralize royal authority faced strong opposition from the great nobles, especially three aristocratic families, the Guise (Catholic) and Montmorency and Bourbon (both Protestant) families, who sought to contain and limit royal authority. However, in the early sixteenth century the long-standing struggle between the Crown and nobles over dynastic power and economics was further

exacerbated by the newly developed religious discord between Catholics and Protestants. Lutheran ideas spread to France in the 1520s, and royal policy toward them varied between tolerance and suppression. Although most French noble families remained Catholic, a number of them converted to Protestantism. During the Habsburg-Valois Wars, Francis I supported the rebellious German Protestant princes within the Holy Roman Empire and remained tolerant toward Protestants in France. However, in 1534 following the Affair of the Placards, when anti-Catholic posters appeared in public places in Paris and in four major provincial cities, Francis came to view the Protestants as a threat and ended his conciliatory policies. Under Henry II Protestant persecution continued intermittently, escalating toward the end of his reign when, in response to the spread of Calvinism, the king created a new court to try Protestants for heresy. Still, by the time Henry died in 1559, Protestants numbered around 10 percent of France's population of 18 million. The Protestant communities were not evenly distributed in France, with the largest communities located in the southern provinces of the kingdom.

The death of King Henry II in a jousting accident in 1559 was followed by a period of royal weakness when the three sons of Henry II failed to provide the necessary leadership: first the ailing 15-year-old Francis II (r. 1559–1560), who reigned less than two years; then his 10-year-old brother Charles IX (r. 1560–1574); and finally the 22-year-old Henry III (r. 1574–1589). The young kings, both inexperienced and ineffective rulers, were dominated by their mother Catherine de Médici and an ultra-Catholic faction led by the brothers Charles (cardinal of Lorraine) and Henri de Guise. The French nobility exploited the monarchical weakness. Similar to the German princes, who adopted Lutheranism as a way to oppose Emperor Charles V of the Holy Roman Empire, the French nobles often converted to Protestantism as a means to secure greater independence from the Crown. Soon armed clashes between Protestant anti-Crown and Catholic royalist nobility began to occur in various regions of France.

In the spring of 1560 a group of disaffected Protestant nobles led by Jean du Barry, Seigneur de la Renaudie, made a failed attempt to gain

control of the young king Francis II by abducting him and arresting the Guise brothers. However, the conspiracy was discovered before it was implemented. The conspirators were executed, and their bodies were hung from the balconies of the chateau of Amboise. The Guise suspected the hand of the prominent Protestant grandee Louis I de Bourbon, Prince de Condé, who was arrested but later freed for lack of evidence. This event only further increased tensions between the two sides. In late 1560 the Protestants began to worship more openly and targeted Catholic churches throughout France, destroying stained-glass windows, statues, sacred vestments, etc.

In December 1560 Francis II died and was succeeded by his adolescent brother Charles X, with Catherine de Medici as his regent. Facing economic problems, internal turmoil, and continued conflict with the Habsburgs, Catherine chose to compromise with the Huguenots (as the French Protestants became known). In early 1561 she freed all religious prisoners and formed a council of clergy, led by Chancellor Michel de l'Hôpital, to seek ways of achieving civic peace. Yet in the subsequent Colloquy at Poissy (September–October 1561), neither the Catholic nor the Protestant side showed a willingness to compromise, instead revealing how far apart their interests diverged. Meanwhile, the Huguenots redoubled their activities, systematically attacking Catholic churches and destroying statues, crucifixes, and altarpieces. These attacks naturally triggered a Catholic response, and the Parlement of Paris ordered the houses used for Protestant meetings to be razed to the ground, while Catholic preachers called the faithful to arm themselves in defense of their faith.

In early 1562 the Crown made another attempt to quiet down increasing disorders and implemented the Edict of Saint-Germain, which allowed the Huguenots to worship publicly outside of towns and privately inside of them. However, on March 1, 1562, Duc de Guise, traveling with an armed escort, came across a Huguenot service in Wassy-sur-Blaise in Champagne and massacred the worshippers. News of the massacre caused great rejoicing among the Catholics while enraging the Huguenots, thus sparking the ensuing wars of religion.

French Wars of Religion, 1562–1598

The massacre of French Huguenot worshippers at a Protestant service on March 1, 1562, in Champagne led to a series of escalating religious wars in France. Between 1562 and 1598 eight wars (1562–1563, 1567–1568, 1569–1570, 1573–1574, 1576, 1577, 1579–1580, and 1585–1598) plunged France into a chaos of civic strife. Galvanized by religious zeal, both sides committed atrocities and sanctioned widespread property destruction. After the Third War (1569–1570), with neither side prevailing and both desiring to end violent conflict, the crown sought a new compromise, resulting in the Peace of Saint-Germain-en-Laye on August 8, 1570. The treaty allowed some concessions to the Huguenots (such as control of fortified towns and the right to hold public office) and stipulated the marriage of Marguerite (Margaret) de Valois, King Charles's sister, to Henry Bourbon of Navarre, one of the Huguenot leaders, who converted to Catholicism for this alliance.

On August 18, 1572, Marguerite de Valois was married to Henry of Navarre, and a large assembly of the Huguenot nobility came to Paris for the wedding. The festivities ended in violence. Starting on August 24, 1572, in what became known as the Bartholomew's Day Massacre, some 3,000 Protestants were massacred in Paris, while over the next six weeks Huguenot property was pilaged and thousands of Huguenots were killed throughout France; in total, probably some 10,000 to 12,000 Huguenots lost their lives in this bloodshed. The news of the massacre was welcomed by the Catholic powers, notably

Philip II of Spain, while Pope Gregory XIII issued a medal commemorating the event.

Despite inflicting heavy losses on the Huguenots, the Bartholomew's Day Massacre failed to destroy them completely. It did, however, reinvigorate their hatred toward Catholics and their resolution to prevail in this conflict. The war began in earnest in late 1572 and continued for the next 17 years. In May 1574 King Charles IX died. His successor, Henry III, negotiated the short-lived Peace of Monsieur (1576), which granted concessions to the Protestants. Yet it was denounced by Catholics, notably the Guise family, which formed the Catholic League with the goal of exerting authority over Henry III and pursuing a war to destroy the Protestants once and for all. The league considered Henry III as being too conciliatory toward the Huguenots and compelled him to rescind his concessions to the Protestants in 1577.

By now France's internal conflict had become a proxy war for foreign powers, which provided financial aid and occasionally military reinforcements. The Guise faction received support from the papacy and Spain, while the Huguenots were supported by England and German states. By the mid-1580s in an attempt to end the war, Henry III tried to convince the leaders of the Catholic League to accept a negotiated settlement with the Protestants. However, the Guise leaders, already exercising great influence in the country and desiring to supplant Henry III with a member of the Guise family, refused to accept the settlement, leading to increased tensions between the king and the Guise family. Dissatisfied with Henry III, the league helped organize the Day of the Barricades on May 12, 1588, during which the king was driven out of Paris and the Guise family effectively seized control of the government; this event set the stage for the "War of Three Henrys" involving King Henry III, Henri duc de Guise, and the Huguenot leader Henry of Bourbon. In December 1588 Henry III, although a devout Catholic, realized that the ultra-Catholic Guise brothers represented his greatest danger and had them assassinated at Blois. Enraged by the murder, the Catholic League called for regicide and waged war against the king. In desperation Henry III allied with Henry of Navarre, and having no offspring, the king declared Henry of

Navarre his heir. In July 1589 the league's wishes to kill the king were realized when a Dominican monk named Jacques Clément assassinated Henry III during an audience.

The assassination marked the start of the final stage of the French wars of religion. Although Henry of Navarre successfully rallied his Huguenot forces and inflicted a decisive defeat on the Catholic League's army at the Battle of Ivry (March 14, 1590), he could not achieve a decisive military victory. He understood that the resolution could be achieved only through political means and allied himself with a moderate group of Catholics, called the *politiques*, to put France's needs ahead of religious differences. He agreed to convert to Catholicism, reputedly stating that "*Paris vaut bien une messe*" ("Paris is well worth a Mass"). Although the league (with Spain's support) continued to resist him until the mid-1590s, Henry of Navarre succeeded Henry III and was crowned as King Henry IV of France at Chartres in 1594, establishing the Bourbon dynasty on the French throne that would reign until 1792. In 1595 Henry declared war on Spain in an effort to stop its continuing support of the Catholic League. In 1598 he issued the Edict of Nantes, which allowed freedom of conscience and equality of rights but allowed Protestants to worship only in locations where they had already established strong communities.

The wars of religion had a profound effect on the country, as France suffered three decades of religious conflict and civic strife. Agriculture in many areas was shattered, commercial life declined severely, and population losses were severe in areas where fighting had been fierce. The war had a great effect on the French monarchy, revealing its fundamental weaknesses. Therefore, Henry IV, a shrewd prince who according to a folksong "knew how to fight, to make love, and to drink," came to realize that he required absolute control to maintain social order in France and keep the nobility in check, paving the way for the French absolutism of the seventeenth century.

Although it is often assumed that the Edict of Nantes ended the wars of religion by resolving religious tensions in France, in reality it failed to do so. Despite remaining in effect for 87 years, the edict failed to normalize relations between

the Catholics and Protestants. The Huguenots, who received important concessions, were deprived of equal status with Catholics, and the Huguenots' right to worship remained restricted. Catholics detested the very fact of the Huguenot presence in the country. Denominational clashes thus occurred regularly throughout the early seventeenth century, and in the late 1620s Cardinal Richelieu used military force to suppress the Huguenots and remove their hard-won political and military rights. Eventually King Louis XIV revoked the Edict of Nantes in 1685.

English Civil War to the Interregnum

The English Civil War emerged as a result of the conflict between Charles I and Parliament in regard to his attempts to circumscribe and curtail the authority of the representative institution of the English realm in addition to his pursuit of forcing Anglicanism on his subjects. While imbued with the notion of divine right of kings to rule by grace of God, which he inherited from his father James I and was an acceptable notion of kingship, Charles I was at odds with the fiscal limitations imposed on him by Parliament. He

thus levied forced loans, and those who refused to contribute were imprisoned. Charles I did not realize that when Henry VIII gave Parliament the right to make him supreme head of the English Church, he gave Parliament a power over the Crown that they were willing to use to protect their rights as property owners and taxpayers. When he called a Parliament in 1628 to raise money, both the House of Lords and the House of Commons granted him funds in exchange for agreeing to the Petition of Right. The Petition of Right recognized that the king could not enact taxes or borrow without Parliament's consent. This situation infuriated Charles, and he governed without a Parliament for 11 years and continued to circumvent Parliament's power over the English purse by seeking loopholes to raise money, such as ship money. Ship money was originally a levy imposed on maritime counties and was used for the purpose of maintaining the Royal Navy, but Charles used it for his expenses outside defense. Moreover, he also infuriated English Puritans (English Protestants who disapproved of Catholic rituals in Anglicanism) by placing Archbishop William Laud as head of the Anglican Church; Laud immediately set about persecuting Puritans. Moreover, Charles I and Laud aggravated the situation by imposing the Anglican Book of Common Prayer in Presbyterian Scotland, effectively triggering a rebellion (1638–1640).

Charles I was forced to meet this threat by convening a Parliament in 1640 in an attempt to unify the realms amid a Scottish invasion after having dismissed a prior Parliament that refused to grant him funds. The Long Parliament, known as such due to its continuous session from 1640 to 1653, immediately outlawed Charles's extraparliamentary taxes and removed Laud from power. Some more radical members sitting in the Commons, mostly Puritans, were keen on extracting power from the Crown and granting it to Parliament, leading to divisions within that body and the emergence of a royalist faction. This is illustrative of the fact that moderates resisted the more radical Puritan objectives and remained loyal to the Crown, despite their disagreements with Charles I. When Charles attempted to arrest parliamentary leaders in 1642, he triggered the impending civil war.

THE LEVELLERS

Among the more militant factions of the radical Puritans in Oliver Cromwell's New Model Army were the Levellers (who according to their critics wanted to "level" all of society to the same status). The Levellers advocated the idea of popular sovereignty and legal equality amid the radical political culture developing within the English Civil War on the parliamentary side. While they were opposed to Charles I's absolutist designs, they also opposed the aristocratic privileges that many moderates on the parliamentary side retained, which were deemed to be at the expense of the majority of the population of England. In their pamphlets and literature (more notably in the *Agreement of the People*), the Levellers called for drastic political changes within the English realm to ensure their ideas regarding social and legal equality. However, they were eventually thwarted by Cromwell and his supporters and were excluded from power after Pride's Purge and the subsequent establishment of the Rump Parliament, along with other fringe groups such as the Diggers (who advocated the dissolution of private property) and the Fifth Monarchists (who preached an eschatological theory around the coming year 1666). Nonetheless, these factions are evidence of the myriad political movements that existed in opposition to the monarchical rule and aristocratic hegemony in English society.

—Abraham O. Mendoza

The initial years of the civil war (1642–1646) pitted the Parliamentary Roundheads (who cut their hair short in the Puritan style) based in London and the wealthy southeast against the Royalist Cavaliers, who were based in the northwest. While most engagements were indecisive in the early years, at the Battle of Marston Moor in 1644 a Scottish-Parliamentary force decisively defeated a royalist army under Prince Rupert. A devout Puritan officer, Oliver Cromwell, reorganized Parliamentary forces into the New Model Army, removing commanders with royalist sympathies and replacing them with strict Puritan leadership. The New Model Army defeated Charles's royalist forces at the Battle of Naseby (1645), subsequently taking the monarch prisoner. While the royalists were defeated, the next two years were spent attempting to make

a settlement with Charles. However, the Parliamentary coalition split up due to religious and ideological differences regarding the future of England. Scottish Presbyterians, Puritan Independents, and radical factions (Levellers and Diggers) all sought different ends regarding religious matters. The Scottish Presbyterians sought to turn the Anglican Church into a national institution with elected leaders akin to theirs. Independents rejected any form of a state church and advocated religious tolerations (except for Catholics). Levellers advocated for suffrage and popular sovereignty, and the Diggers pushed for the abolition of private property.

These divisions led to Scottish Presbyterians joining forces with resurgent Cavalier forces to fight for the king against Parliament, given that he had sent out feelers that he would accommodate their religious interests. However, Cromwell effectively crushed this attack and ended divisions within Parliament by staging a coup. Colonel Thomas Pride only allowed ministers of Parliament friendly to Cromwell to enter Parliament (Pride's Purge), effectively creating what was known as the Rump Parliament. This would also ensure the exclusion of more moderate members of Parliament who might oppose the execution of the monarch. Cromwell took the opportunity to deal with Charles I (now stripped of his title and referred to as Charles Stuart) and had him executed on January 30, 1649, decapitated by ax, thereby removing him as a source of contention for rebellion. Cromwell thereby instituted an English Republic, effectively ruling through the New Model Army and the Rump Parliament, which was in essence a military dictatorship, known to posterity as the Interregnum (1649–1660). In 1649 he conquered Ireland and then Scotland (1650–1651), ensuring English control of all the British Isles and eliminating potential dissent. In 1653 he disbanded Parliament and instituted himself as lord protector of England due to continuing divisions within that body. While he was hesitant to have himself made king, he and his family enjoyed the royal trappings of the Crown. Moreover, his taxation measures imposed on the realm to fund his wars were far more than those of his royal predecessor. Cromwell ruled in this manner until his death in 1658, after which his son Richard became the next and

final lord protector. Because Richard lacked military experience and Parliament continually ignored the army's requests for funding, the army demanded that he dissolve Parliament, a move that caused his resignation on May 25, 1659. By 1660, General George Monck forced the Rump Parliament to recall the Long Parliament to include those excluded during Pride's Purge. The Long Parliament dissolved themselves, and a general election was held for the first time in 20 years. In 1660 the Convention Parliament invited Charles's son to return to the throne as Charles II, thereby restoring the Stuart monarchy.

English Restoration to the Glorious Revolution

After the tumultuous English Civil War and the repressive Interregnum under Oliver Cromwell's dictatorship, the English Protectorate he established in Britain proved short-lived. Cromwell's son Richard proved unable to maintain the loyalty of the English military, despite his attempts to maintain the structure of his father's state, and he was quickly removed from power. The reinstatement of the mostly Puritan Rump Parliament followed in 1659 amid attempts made by Cromwell's former military leaders to assert control of the realm. However, these were thwarted by General George Monck, who would instigate the dissolution of the Rump Parliament and the election of the Convention Parliament, which invited Charles I's son, in exile at the time, to take the English Crown as Charles II and the third Stuart monarch. Through the Declaration of Breda issued by Charles II in 1660, he accepted

the English Crown, and the Convention Parliament retroactively proclaimed him king of England since the death of his father in 1649. The English Restoration effectively reinstated the Stuart monarchy in England but did not end the political and religious divisions prevalent within English society.

While the Act of Indemnity and Oblivion of 1660 did return a significant amount of lands to former royalist supporters of Charles I, it also instituted official state lenience to most Cromwellian rebels by granting them indemnity. Subsequently the Cavalier Parliament of 1661 instituted drastic political changes that ensured the primacy of Parliament in taxation policy and effectively protected the remaining royal properties confiscated by the rebels during the English Civil War and the Interregnum. However, religious issues remained contentious amid the reestablishment of the Anglican Church and the myriad divisions among dissident groups and crypto-Catholics in English society. The Act of Uniformity of 1662 forced the Anglican Book of Common Prayer on all clergy, effectively expelling those who did not comply, who were henceforth referred to as Dissenters or Non-conformists (who were mostly Puritans). The related legislation, the Corporation Act of 1661, which required an oath of allegiance to the Crown by town officials as well as acceptance of the rites of Anglicanism, and the Conventicle Act of 1664, which outlawed meetings of five or more people, were both attempts by the Cavalier Parliament to enforce Anglican uniformity in the realm. These acts, known collectively as the Clarendon Code after the unpopular chief minister and lord chancellor, the Earl of Clarendon Edward Hyde, were illustrative of the contentious religious politics of the Restoration period.

While Charles II attempted to reverse some of the gains made by Parliament and persecute Puritans, it was not to the same degree as his father. Charles II clandestinely promised to the French king Louis XIV to restore England to Catholicism in exchange for large subsidies. In 1670 Charles signed the clandestine Treaty of Dover with France in which Louis granted Charles a pension and a guarantee to send troops to restore Catholicism in England if so desired. In exchange Charles II would publically

THE POPISH PLOT

The Popish Plot was an episode in Restoration England that illustrated the level of religious animosity in society and the deep suspicions held against Catholics and the French by the English. In the early 1670s Anthony Cooper, the earl of Shaftesbury (former lord chancellor), used his position in the anti-Catholic Green Ribbon Club and the Whig faction in Parliament to stir suspicion of Catholic machinations against Anglican England. In 1678 a defrocked Anglican clergyman, Titus Oakes, made accusations against the queen, Catherine of Braganza, and her physician, disclosing their alleged plot to poison the king and lead a Catholic rebellion. A month later Charles II's negotiations for a pension with Catholic France were revealed, but since the king was infallible, his minister, Thomas Osborne, the earl of Danby, was impeached by Parliament. Despite Charles's dissolution of Parliament, amid the panic unleashed by Oakes and propagated by the Green Ribbon Club, ten people were tried and executed on charges of treason, and the queen was deemed a traitor. While Shaftesbury and the Whigs took advantage of the situation to attempt to pass the Exclusion Bill and prevent the ascension of the Catholic James II to the throne upon the king's demise, Charles used his royal prerogative to dissolve Parliament and prevent its passage. Nonetheless, this alleged plot is indicative of suspicions that most of English society held in regard to Catholics, and based on Charles II's negotiations with Louis XIV, these suspicions were not completely unfounded.

—Abraham O. Mendoza

declare for the Catholic faith when convenient (which he did on his deathbed in 1685 when no longer “convenient”). Despite these machinations, anti-Catholic sentiment, particularly as exhibited during the Popish Plot, remained strong throughout much of English society. This sentiment was exacerbated by the fact that Charles's Portuguese and Catholic bride, Catherine of Braganza, had been unable to produce an heir. Even though he was encouraged to do so, Charles refused to divorce his wife, which meant that the de facto heir to the throne was

his brother James II, whom most believed to be Catholic. Parliament was able to maintain its power, despite the development of party politics (proroyal staunchly Anglican Tories and antiroyal Whigs). Moreover, Nonconformists were too numerous and too powerful in English society to be dislodged and were expected to bow to Anglican authority. Upon Charles II's death in 1685, his crypto-Catholic brother James II assumed the throne.

The Glorious Revolution of 1688 was essentially the invitation of William and Mary of the Netherlands by Parliament to receive the English Crown and essentially remove James II from power. This occurred as a result of James II's alienation of both Anglican Tories and nonconformist Whigs through his attempts to restore Catholicism in England. Moreover, both his second wife, Mary of Modena, and his son James were staunch Catholics. In 1687 James II issued the Declaration of Indulgence, which allowed freedom of worship to Catholics and Nonconformists and also allowed them into the military and public office. This was an attempt to dislodge the power base of the Anglican establishment in Parliament, which had enacted the Test Act back in 1673 to keep non-Anglicans out of the military and government. Mary, as James's eldest daughter, held a claim to the English Crown and thereby became a legitimate contender. Mary was initially offered the English Crown, but William would not accept being a royal consort and insisted on ruling jointly with her on equal footing. James immediately fled to France after William arrived in England with his army in 1688, and Parliament declared James's abdication. Thereby William and Mary accepted the Crown with the condition that they accept the Declaration of Rights (Bill of Rights of 1689), which outlined English civil liberties and outlawed the excesses practiced by the Stuarts, severely curtailing royal power in England and ensuring the primacy of Parliament in the governance of the realm. The Act of Toleration of 1689 was enacted to ameliorate religious tensions in England by allowing freedom of worship to Nonconformists (Catholics were specifically not included). This episode is referred to as the Glorious Revolution because supposedly no blood was spilled in the change of government, but in fact there were

battles fought in England and Scotland as well as the Williamite War in Ireland.

Thirty Years' War

The Thirty Years' War (1618–1648) was both a civil war within the Holy Roman Empire and a major intra-European war, with both religious and geopolitical objectives on the part of all belligerents. It was a civil war as a result of the Austrian Habsburg policy to assert centralized power over its Protestant domains, particularly in Bohemia where the conflict began, as well as to secure their primacy within the Holy Roman Empire. Moreover, it was an intra-European conflict that pitted Protestant Scandinavian states (Denmark and Sweden) in league with Bourbon France (which was Catholic) against the Habsburgs (both Spanish and Austrian) for hegemony in the region. While the first stage of the war was fought mostly by Germans against Germans, the latter stages were mostly engagements by foreign mercenaries at the whims of the highest bidder, destroying, pillaging, and raping in their path of destruction. Furthermore, while this conflict did exemplify religious objectives, it also was fought for state interests, albeit in the context of Habsburg-Bourbon geopolitical objectives.

As the heir of the Habsburg throne, Ferdinand of Styria was keen on reversing the policies of religious toleration of prior Habsburg monarchs in the now-Protestant familial landholdings. His policies in Bohemia resulted in the so-called defenestration of Prague on May 23, 1618, whereby two Catholic emissaries sent to enforce his policy were thrown out of

the window of Hradschin Castle, effectively deposing Habsburg authority. With the death of Emperor Matthias, Elector Frederick V of the palatinate was elected by the Bohemian rebels as King of Bohemia, infuriating newly crowned Holy Roman Emperor Ferdinand II. Frederick V and the Bohemian rebels counted on Protestant support, but it was Ferdinand who secured solid Catholic support from Maximilian (Duke of Bavaria) and fellow Habsburg Philip III of Spain in addition to Protestant support from the Lutheran Elector of Saxony. At the Battle of White Mountain in 1620, the Bavarians trounced Bohemian forces. By 1622 Habsburg forces and their Spanish and Bavarian allies had conquered Bohemia and the palatinate, thus depriving Frederick V of his German lands.

In spite of Protestant defeats, the war continued as a result of mercenary armies under the leadership of such men as Ernst von Mansfeld (1580–1626) and Albrecht von Wallenstein (1583–1634). Mansfeld had initially fought for the Spanish but switched sides and effectively fought for Frederick. Despite the defeat of his patrons, Mansfeld continued to march within

THE DEFENESTRATION OF PRAGUE

The outbreak of the Thirty Years' War, which wreaked havoc and devastation across central Europe from 1618 to 1648 and had long-standing structural causes, is attributed to the defenestration at Prague. Following the 1617 election of the Catholic Ferdinand as king of Bohemia, he attempted to institute Catholicism in the realm. On May 23, 1618, Protestant elites ruled against two Habsburg administrators for violating Bohemian freedom of religion, as guaranteed by prior Habsburg rulers. Both of them were subsequently thrown out of the windows of Hradschin Castle. While both men survived by allegedly landing in a dung heap, this act effectively meant the Bohemian repudiation of Habsburg rule. This event triggered a civil war with intra-European dimensions, characterized by religious and political objectives on the part of major belligerents and also illustrating the shift in motivations for major European wars toward geopolitical motives.

—*Abraham O. Mendoza*

Germany, living and looting in northwestern Germany. Maximilian kept his forces in pursuit of Mansfeld while harassing Protestant populations in their path. This brought Christian IV of Denmark into the conflict, as he saw himself as protector of his fellow Protestants in the north, albeit with no German allies. Danish forces were soundly defeated by the Bavarians at the Battle of Lutter in 1626. In the meantime, Ferdinand was actively scheming to create a centralized Habsburg state, reduce Protestant power, and enforce Catholicism throughout the realm. Moreover, he hired Wallenstein to pursue his enemies and reduce his reliance on Maximilian. Wallenstein chased Mansfeld out of Germany while his forces actively destroyed, pillaged, and raped along the way. By 1629 Ferdinand issued the Edict of Restitution, which was an attempt to eliminate Protestantism in the Holy Roman Empire and centralize Habsburg rule as a Catholic absolutist monarchy.

In 1630 Swedish forces under Gustavus Adolphus entered northern Germany under the pretense of defending Protestantism. Ferdinand had removed Wallenstein from power in an attempt to placate his subordinates in the Imperial Diet and ensure the succession of his son to the throne and aid for the Spanish Habsburgs against the Dutch and the French. In light of these developments, Catholic France subsidized Swedish forces, in spite of their religious denomination, against the Habsburgs. France entered the war in an attempt to thwart Habsburg expansionism. Adolphus secured alliances with Protestant Brandenburg and Saxony against their Habsburg overlord. By 1631 Adolphus crushed Habsburg forces at the Battle of Breitenfeld, reversing Catholic territorial gains made in the past decade. At the Battle of Lützen in 1632 Protestant forces defeated the Habsburgs, despite the battle death of Adolphus. Wallenstein returned to the fore and, while presumably fighting for the Catholic Habsburgs, looked for a better deal with the Protestants. In 1634 he was dismissed of his command and murdered by an Irish mercenary. Later that year Habsburg forces defeated the Swedes and their German allies at Nördlingen.

From 1635 to 1648 French and Swedish forces harried the Habsburgs in Germany without forcing any major engagements or decisive

battles. Mercenary contingents on both sides lay waste to German cities and towns, destroying, looting, raping, and devastating the local populations. This led to a drain in population, economic decline, famine, and a prolonged period of suffering for a significant portion of the German population. Roaming bands of mercenaries, in tandem with their accompanying camps, lived off the local population and its resources. Ultimately, peace was negotiated through the intra-European Peace of Westphalia of 1648. This peace ensured the continued fragmentation of the Holy Roman Empire, recognized that German princes had the right to choose the religion of their realms (Catholicism, Lutheranism, and Calvinism), and forever ended Habsburg ambitions to consolidate their power over the German lands. The Swiss Confederation and the Dutch Republic achieved their independence from the Holy Roman Empire. France, Sweden, Bavaria, Brandenburg, and Saxony all received some territorial compensation at the expense of smaller German states. The Habsburgs were able to consolidate their power in their ancestral homelands in Bohemia and Austria. However, what had begun as a religious war within the Holy Roman Empire, albeit to ensure Habsburg hegemony, ended as a primarily dynastic struggle between Bourbon France and Habsburg Spain and Austria.

Wars of Religion—The Eastern European Experience

Because eastern Europe had long been a religious borderland, the various Catholic, Orthodox, Muslim, and pagan (until the late fourteenth century) polities that fought each other often employed religious justifications for their wars. Despite this tension (or perhaps because of it), many of these states were multiconfessional and became fairly tolerant of religious minorities. Yet while the Reformation and Counterreformation

► THE THIRTY YEARS' WAR, 1618–1648

Although in part a religious struggle, dynastic alliances, the rights of nobles and burghers, and economic and territorial ambitions all played a role in plunging Europe into one of the bloodiest periods of its history. For the most part, however, those East European states outside of the Habsburg empire played only a minor role in the hostilities of 1618–1648. In fact, the year of the Peace of Westphalia marked the beginning of two decades of violent internal and external conflicts in eastern Europe.

The war began in Bohemia in 1618 with the defenestration of Prague in which Protestants demonstrated their dissatisfaction with the Catholic Ferdinand of Styria being placed on the throne by launching his officials out of the castle windows. Two years later, however, the Protestant Bohemians were crushed at the Battle of White Mountain. Those rebels who did not flee were executed, and their lands were taken over by Catholics loyal to the Habsburg regime.

The Protestant revolt against the Habsburgs in Hungary had more success, mainly because the

Hungarians were aided by the neighboring Protestant prince of Transylvania, a multiconfessional state nominally a tributary of the Ottomans. When Prince György Rákóczi I made peace with the emperor in 1645, he was able to secure some liberties for the Hungarian Protestants.

Dynastic and territorial ambitions also drew Poland-Lithuania into the war. King Sigismund III, son of the king of Sweden, had lost his Swedish inheritance in 1599 and spent much of his reign trying to regain it. However, despite the fact that Sigismund was Catholic and Gustavus Adolphus of Sweden was Protestant, these were not confessional conflicts but instead just one of a series of battles between Poland and Sweden for hegemony in the Baltic. When the two kings died in 1632, Poland-Lithuania made peace with Sweden and turned to defend its eastern and southern boundaries from Russia and the Ottomans, thus ending its direct involvement in the Thirty Years' War.

—Paul Milliman

in eastern Europe did not produce anything like the endemic confessional violence that swept through France in the late sixteenth century and the Holy Roman Empire in the early seventeenth century, religion played a key role in the wars that engulfed eastern Europe in the middle decades of the seventeenth century.

By the seventeenth century, most of eastern Europe was divided between four multiethnic and multiconfessional empires: Sweden, Poland-Lithuania, the Habsburg empire, and the Ottoman empire. A fifth state, Muscovy, was attempting to unify all Russian Orthodox subjects under its rule. The degree of religious liberty within these states varied over time, but for the most part religious minorities enjoyed some degree of freedom. For example, Christians and Jews within the Ottoman empire were regarded as *dhimmis*, protected peoples who paid a *jizya*, or poll tax, that entitled them to religious freedom. They were also afforded some degree of self-governance under the millet system, in which subject religious communities were

governed by their own religious leaders. In addition, the 1573 Confederation of Warsaw guaranteed religious freedom to the inhabitants of the Polish-Lithuanian Commonwealth.

During the first two decades of the seventeenth century, however, toleration of religious minorities began to break down. In the Holy Roman Empire a series of conflicts between Bohemian, Moravian, and Hungarian Protestants culminated in the violence of the Thirty Years' War (1618–1648). Ironically, the end of this war was just the beginning of widespread confessional conflict in eastern Europe.

In 1648, the year of the Peace of Westphalia, Bohdan Khmel'nyts'kyi led the Zaporozhian Cossacks in a revolt against Polish rule, with the intent of creating an independent Ukrainian state. Although a number of factors contributed to this rebellion, the Orthodox Cossacks claimed religious persecution as one of the main justifications for the war. Confessional conflict had been fomenting since the 1596 Union of Brest, which caused a schism in the Ruthenian

(modern Ukrainian and Belarusian) Orthodox Church between Uniates, who recognized papal jurisdiction, and those who did not. After the Cossacks crushed the Polish army in May 1648, they massacred or forcibly converted many Uniates, along with Catholics and Jews. In 1654 the Cossacks turned to Orthodox Muscovy for assistance, and the Pereiaslav Agreement cites the defense of Orthodoxy as Muscovy's justification for breaking the Eternal Peace of 1634 with Poland.

During the next two years, Poland-Lithuania was invaded by its Protestant neighbors to the north and south: King Charles X of Sweden and Prince George Rákóczi II of Transylvania. By the end of 1656, most of the Commonwealth had been partitioned between these Protestant and Orthodox states. The plundering of Catholic churches and harassment of the clergy prompted King Jan Kazimierz to proclaim the Virgin Mary as Queen of Poland in order to help incite his subjects to defend Catholicism. Ultimately, however, economic and geopolitical factors played a role in involving other European states in the conflict against Sweden and Transylvania. George II was killed in a rebellion against the Ottomans in 1660, while Charles's death in the same year resulted in the signing of a peace treaty between Sweden and Poland. The war between Poland and Muscovy, however, was not resolved until 1667, in part because some of the Orthodox subjects in Muscovy's newly conquered lands were wary of the tsar's domination of their political and religious liberties.

In the centuries following the Ottomans' conquest of Constantinople in 1453, Muscovite propagandists had begun to characterize Muscovy as the "Third Rome," the political and ecclesiastical center of true Orthodoxy. Therefore, at the same time that Tsar Aleksei Mikhailovich was expanding the boundaries of his state to incorporate the Orthodox subjects of Poland-Lithuania, he also undertook a series of bureaucratic and ecclesiastical reforms in Russia. As in the Western wars of religion, however, these policies were linked in the minds of his subjects as attacks not only upon their religious rites but also upon their political rights. Revolts followed, sparking a *raskol* (schism) between the reformers and the so-called Old Believers. By the 1680s, tensions had escalated to such an extent

that some communities of Old Believers began to practice mass suicide through self-immolation in order to resist the reforms. Although arriving later and following a course different from those in the West, the East European wars of religions thus proved to be just as devastating.

Habsburg-Dutch War (Eighty Years' War)

The Eighty Years' War, also known as the Dutch Revolt, lasted from April 1572 to April 1607 and from April 1621 to June 1647, effectively ending at the Peace of Münster in January 1648. While it was a conflict centered on Habsburg Spain's attempt to crush the Calvinist Dutch rebellion headed by the provinces of Holland and Zeeland and mostly fought in the Low Countries between Spanish troops and Dutch rebel armies, it had global repercussions in the context of Spain's wars against Bourbon France, Tudor England, and the Ottoman empire and colonial conflicts with the Dutch in Brazil, the Caribbean, and North America. Moreover, it is a religious war due to Philip II's reluctance to allow religious freedom for the Calvinist Dutch in the northern provinces, which spurred their desire for independence from the Habsburgs. Given that Spain was caught in several wars simultaneously for nearly a century (with the English, the French, and the Ottomans), it was never able to bring the war with the Dutch to a swift end

regardless of its financial and military potential. Moreover, the Dutch were never able to successfully remove the Spanish foothold in the southern Low Countries (Flanders and the Brabant) regardless of their growing military power and alliances vis-à-vis Spanish forces.

As dukes of Burgundy the Habsburgs held the Low Countries as a hereditary possession, which were divided into 17 autonomous provinces. The Low Countries were characterized by thriving mercantile and commercial towns as well as a cosmopolitan entrepôt that served as financial and distribution centers for trade in Europe, contributing to their wealth and exposure to external currents of thought. Under Charles V the Low Countries were allowed a significant degree of autonomy, given their economic importance in financing Habsburg wars on the continent. The States-General, under the control of local merchant families and aristocrats, held a considerable amount of independence from Madrid. Moreover, Protestantism (in its Lutheran, Calvinist, and Anabaptist variants) had made significant inroads in the expanding Dutch middle classes, regardless of Charles V's attempts to reverse these trends.

Upon the accession to the Habsburg throne by Philip II, he attempted to centralize direct administrative control in the Low Countries as well as hinder the growth of Protestantism, which incited resistance in his Dutch and Walloon subjects. He increased the number of bishops in the Low Countries from 4 to 18 and increased the power of the Inquisition, further infuriating the local Protestants, who responded by destroying churches in 1566. In 1567 the Duke of Alba, along with 10,000 Spanish troops, was sent by Philip II to impose order and eradicate Protestantism and regional autonomy. While they were able to crush religious and political resistance to Habsburg authority in the south, the north remained in opposition to Spanish incursions. In 1572 the 17 provinces, under the nominal leadership of the Prince of Orange, were in open armed resistance, and rebellion against Spanish rule effectively began. In April 1572 Dutch rebel ships succeeded in capturing ports in Zeeland and Holland, which at the time were Catholic regions in the north. At this time thousands of Protestant refugees

➤ THE SPANISH ARMADA AND THE DUTCH REVOLT

In 1586 Philip II planned an invasion of England to once and for all quash that heretical kingdom and reassert Catholicism in that wayward realm. To do so, he assembled a Spanish fleet in Lisbon that would sail to the Spanish-controlled Low Countries, pick up the crack troops of the Duke of Parma, and cross the English Channel to the Thames River. By 1588, despite a series of setbacks, the Invincible Armada was mobilized and embarked with 130 ships and 30,000 troops. Unable to make contact with Parma's forces, the Armada was left alone to engage the English fleet, composed of smaller and more maneuverable ships. The Armada, in a giant crescent formation, met the English fleet in the English Channel, but both sides were reluctant to engage in combat. The Armada, anchored in Calais, was attacked by English fire ships, leading the Spanish fleet to scatter at sea, breaking formation. The English fleet attacked with full force, using its smaller ships to further scatter the larger yet bulkier Spanish fleet. The "Protestant Wind" then pushed the remnants of the Armada out to the North Sea, chased by the English around Scotland and Ireland with scores of ships and thousands of troops lost along the way. Half the fleet managed to return to Spain but put England and the Dutch on the defensive against Habsburg power in the Atlantic, thus ensuring their cooperation and eventual Dutch independence.

—Abraham O. Mendoza

from the south moved to the north, fearing Spanish reprisals. In 1577 the provinces united under the Union of Brussels against the Spanish, but when the Duke of Parma's army began to defeat Dutch forces, the Walloons returned to the Habsburg fold (organized into the Union of Arras in 1579), forcing the Prince of Orange to reorganize the northern provinces into the Union of Utrecht in 1579. The States-General of the Dutch rebel provinces declared their independence from Philip II in 1581, establishing the United Provinces (also known as the Dutch Republic).

Despite Spanish military superiority, Philip II was never able to effectively dislodge Dutch military resistance, mainly due to other

simultaneous conflicts that impeded concentrating the full strength of Spanish power projection in the Low Countries. Spanish attempts to invade England (most notably the Invincible Armada of 1588), direct and indirect interference in the French wars of religion, and endemic warfare in the Mediterranean littoral with the Ottomans also preoccupied Philip II in what he saw as his religious Catholic duty in stamping out Protestantism and preventing the spread of Islam, albeit at heavy financial cost. In this context, the Dutch rebels were able to garner alliances with the English and the French and benefit from Spanish distractions in the Mediterranean with the Ottomans. However, this also prolonged the conflict because of the Spanish ability to secure control over the southern Catholic (mostly Walloon) provinces and to successfully defeat the Dutch in various operations using their crack troops. Dutch commander Prince Maurice of Nassau sought to reunite the provinces, but established religious divides between the north and the south prevented this from occurring. In 1609 the Dutch and the Spanish arranged a truce that lasted for 12 years, during which the Dutch consolidated their military, naval power, and wealth, essentially becoming a world power unto themselves vis-à-vis the Habsburgs in the Americas and European trade.

In 1621 when war between the Spanish (now under Philip IV) and the Dutch resumed, Dutch

naval power secured effective control over the coastal and river systems of the United Provinces as well as those of the southern provinces. While Spanish forces were able to successfully counter Dutch forces, they were never able to defeat them in a way that would reassert Spanish control. Spanish military decline in the Low Countries was largely related to its overall decline vis-à-vis France and England, which had exhausted Spanish resources in the New World and in Europe. By 1648 both Dutch and Spanish fears of Bourbon France, which now threatened to conquer the Dutch and was the Habsburgs' main antagonist, led to the end of the Eighty Years' War. In that year the Spanish conceded Dutch independence, regardless of nearly a century of attempting to reassert Catholicism and Habsburg authority in the region as well as maintain Spanish prestige as a world power. Inadvertently and indirectly, they had contributed to the consolidation of the Dutch provinces as a major maritime global power and economic powerhouse.

■ Introduction: Alliances of Convenience

Writing in the early sixteenth century, Italian political theorist Niccolo Machiavelli advised rulers that “the one who adapts his policy to the times prospers, and likewise that the one whose policy clashes with the demands of the times does not.” Such political flexibility was crucial to political or military success, and so it inevitably bred short-term alliances of convenience by which sides involved hoped to prosper. Thus, in 1536 many European rulers were surprised to hear about an alliance between France and the Ottoman empire. This

agreement, possibly the first official nonideological coalition between a Christian and Muslim empire, was clearly an alliance of convenience since it provided both states an opportunity to harm a common enemy, the Habsburg empire. Similarly, in the late fifteenth century an alliance was forged between Venice and the Aq Qoyunlu state against the Ottoman empire, while in 1622 Safavid Iran and England united their efforts against the Portuguese, whose commercial network in the Persian Gulf (and the Indian Ocean in general) they both desired to supplant. The

Spanish conquest of the Aztec empire would have never succeeded if not for an alliance that the Spanish established with Native American tribes, notably with the Nahuas and Tlaxcalteca, who were threatened by the Aztecs.

As a rule, such alliances were short-lived and broke down once their usefulness expired. Former allies could, in fact, find themselves on the opposite sides of newly formed political marriages of convenience. Thus, during the War of the Austrian Succession (1740–1748) France and Prussia united their forces against Austria, which was eventually defeated. Yet concerned about the rising power of the Prussian state, France willingly accepted the Austrian offer of an alliance and, following the Diplomatic Revolution of 1756, fought against Prussia during the Seven Years' War (1756–1763).

Hormuz Hustle—The English-Persian Alliance Ousts the Portuguese, 1622

Under the auspices of the Portuguese crown, Vasco da Gama's voyage in 1497–1499 from Lisbon around the Cape of Good Hope to India established the all-sea route between Europe and Asia. With this voyage he initiated historical processes equally as momentous as Columbus: the entrance of various European powers to the Indian Ocean, which magnified the economic importance of India and neighboring lands for Europe, laying the foundations for a global Portuguese empire. Their Asian empire was administered from Goa (in India) by the Estado da Índia. It was in this context that one of the earliest Portuguese conquests was the kingdom of Hormuz.

The city of Hormuz was probably founded by Ardashir I (r. 224–241) of Persia and was mentioned by Ptolemy and later visited by Marco Polo and Ibn Batuta. By the tenth century it was a principal port and market, and an Arab ruling dynasty was established there around 1100. This was "Old Hormuz," situated on the Persian shoreline. Owing to repeated raids, the town was moved in 1300 to an island offshore. This became "New Hormuz," and eventually it was referred to as Hormuz. With its conquest of territories along the Arabian and Persian coastlines

of the Persian Gulf, the kingdom of Hormuz developed into a formidable regional power. Due to its location at the entrance (Strait of Hormuz) to the Persian Gulf, its role as a great trade emporium, and its mercantile links with India, Hormuz became rich and powerful, maintaining the largest navy in the Gulf. According to reports, it had the largest population in the Gulf region (approximately 40,000), who were from the lands stretching between India and Europe, enjoying religious toleration with a great diversity of Muslims, Christians, Jews, and Hindus. This was its situation when it was first encountered and conquered by the Portuguese in 1507 under Afonso de Albuquerque, though it was abandoned by them and reconquered in 1515.

After 1515 the kings of Hormuz were confirmed as vassals of the Portuguese king, paid tribute, and shared their customs revenues; in 1543 the Portuguese took control over the customhouse. Hormuz's kings were appointed by the Portuguese captain on the island. The Portuguese also conquered other sites in the region, such as Qishm, Bahrain, and Muscat, but Hormuz remained the most important of their possessions, as its strategic location and ample revenues from customs were unparalleled. However, it seems that Portuguese rule over Hormuz also set off a decline of its trade, as they imposed new duties and regulations, making shipping more costly, and were especially harsh with important traders who were minorities, including Jews and Hindus. As a result, new trade routes (sea and land) were created that bypassed Hormuz.

With the ascension to the Persian throne of Shah Abbas I (r. 1587–1629), considered the greatest Safavid ruler, the Portuguese faced a new threat. Abbas began to utilize the silk trade as a means to finance his expansionistic policies and centralize control over Persia. He captured Caspian silk-producing areas and redirected silk trade away from Ottoman lands and instead toward the Gulf; he also established a royal silk monopoly. This meant that the Gulf, as the access point to trade with the outside world, took on a new importance in Abbas's strategies, and Portuguese Hormuz was a major obstacle to his designs. The Persian conquest in 1602 of Bahrain, an island under the suzerainty of Hormuz and from which the Portuguese derived revenue

➤ A MERCHANT-ADVENTURER'S ACCOUNT OF HORMUZ

Ralph Fitch, a relatively unknown figure in the history of European explorers, actually holds the distinction of being the first Englishman to reach and return from India during a journey that lasted from 1583 to 1591. He could be classed as a merchant-adventurer, his travels having both exploratory and mercantile purposes while simultaneously promoting English national interests—including carrying letters (and no doubt instructions) from Queen Elizabeth herself—in the face of intense imperial and trade competition with the Spanish, Portuguese, Dutch, and French. As a matter of fact, Fitch was captured for a time by officials of the united crowns of Spain and Portugal, arriving at Hormuz as a prisoner and then taken to India. The hazards of his long journey resulted in his being the sole survivor of the original party to make it back to England. He wrote this description of Hormuz during his travels in the region in 1583.

“Ormuz is an Island, in circuit about five and twenty or thirty miles [about 45 kilometers], and is the dryest Island in the world, for there is nothing growing in it, but only salt. For their water, wood or victuals, and all things necessary, come out of

Persia, which is about twelve miles [19 kilometers] from thence. All the Islands thereabout be very fruitful, from whence all kind of victuals are sent unto Ormus. The Portugals have a Castle here which standeth near unto the sea, wherein there is a Captain for the King of Portugal, having under him a convenient number of soldiers. . . . In this town are merchants of all Nations and many Moors and Gentiles. Here is very great trade of all sorts of spices, drugs, silk, cloth of silk, fine tapestry of Persia, great store of pearls, which come from the Isle of Baharim [Bahrain] and are the best pearls of all others, and many horses of Persia, which serve all India. They have a Moor to their King, which is chosen and governed by the Portugals.”

from its valuable pearl trade, arguably heralded the eventual doom of the Portuguese in Hormuz. Abbas's policies propitiously intersected with the aims and economic interests of new players in the Gulf, the English.

The English had been cultivating better relations with Abbas since the 1590s as part of newly invigorated mercantile interests in London with the weakening of Portugal after the Iberian Union of 1580, the English defeat of the Spanish Armada in 1588, and information garnered from the Asian journeys of Englishmen in the 1580s. It was felt that the moment was right to enter the Indian Ocean. After the formation of the East India Company (EIC) by charter of Queen Elizabeth in 1600, the EIC began sending trade missions to India, and English traders became active in the Gulf from 1616 to 1619; English factories (trading stations) in Persia were linked to a factory built in the Gulf port of Jask in 1619. English traders gained silk concessions

from Abbas and even made naval challenges to the Portuguese in the Gulf.

Meanwhile, Abbas was tightening the noose: challenging the Portuguese around the Gulf and interdicting supplies sent to Hormuz. However, Abbas did not have the naval forces to face the Portuguese on the seas. Abbas's commander of the actions against the Portuguese, Imam Quli, the khan of Shiraz, offered a deal to the English commanders of a newly arrived fleet at Jask in late 1621: in return for assistance in conquering Hormuz, the English would gain customs-free trade rights and half the spoils of Hormuz. The Persians would provide ground troops and pay for half the costs of the enterprise. However, the two versions of this agreement differ as to who would keep Hormuz's castle. Furthermore, according to English sources, hints were made that noncooperation with this campaign meant revision of English trading rights. While the EIC in London discouraged offensive military

adventurism and England was currently at peace with Spain (Spain and Portugal were united during 1580–1640), EIC representatives in Asia thought that this was a golden opportunity.

Thus, in early 1622 the combined forces first took the Portuguese fortifications in Qishm, cutting off supplies to Hormuz. From February to April they attacked Hormuz: British ships encircled the island, while Persian soldiers took the city and besieged the Portuguese castle. The Portuguese in the castle ran out of supplies and surrendered in May. Hormuz city was then plundered, with the Persians getting the lion's share; it seems that the English did not recoup enough to balance out their expenses, nor did they acquire the castle or its ordnance. When news of the campaign reached London, the EIC had to pay a fine to King James I for endangering Anglo-Spanish relations.

Although the Safavids were an instrumental part of this campaign, Richard Boothby, a merchant familiar with Hormuz, later criticized the campaign's outcome, arguing that Hormuz in its heyday did more trade than London and Amsterdam combined and that the English should have held it. Despite these issues, from the English perspective they successfully undermined Portuguese predominance in the Gulf and ingratiated themselves with the Persians. Both the Persians and the English, as well as the Dutch, continued to skirmish with the Portuguese in the Gulf, while the Portuguese never recovered from the loss of Hormuz, which was considered "the key to Estado da India." By 1650 they lost Muscat, their last major stronghold in the region. The English went on to become the dominant power in the Gulf until 1971. From Abbas's perspective, he removed his greatest trade rival. Hormuz city was dismantled, and the material was used to build his new port at Gombroon, renamed Bandar Abbas, which became the most important port in the Gulf for the next 150 years.

Changing Sides—Authority and Loyalty in Early Modern Europe

Loyalty in early modern Europe was a complex idea that involved many factors. The notion of nationalism did not yet exist. Instead, Europe was regionalized during the medieval era and, as a result, remained so even during the early modern period. The centralization of power under the monarchs meant that the nobles lost much of their ancient powers and privileges, especially that of commanding militaries. Despite this, many people still maintained strong loyalties to the regional lords, which was an obstacle in the development of absolutism. This proved to be problematic for monarchs when they needed to recruit soldiers in times of war.

In the medieval era, loyalty was solidified with oaths and exchanges of services. Power was measured by the amount of land one owned, not necessarily by titles. The more land a noble owned, the more rents brought in and the more men he commanded. The feudal system and the oaths sworn meant that a lord could call upon his vassal at any time to request the men necessary to fight a battle or a war in exchange for the protection that their own power guaranteed. Therefore, the king or queen was always threatened by the nobles, who could gather troops at any time to form a rebellion. The development of the centralized state meant that the nobles technically lost this power to summon armies without the permission of the king. Instead, kings gained the loyalty of their nobles by bestowing titles and privileges on them. The creation of bureaucracies not only aided in the administration of the ever-growing government

➤ MAGELLAN—PORTUGUESE CAPTAIN FOR A SPANISH FLEET

In the sixteenth century Portugal and Spain were fierce rivals, competing over the oceans in an attempt to find better trade routes to Asia and its lucrative spices and commodities. These forays into the Indian Ocean caused a shift to begin in the European economy, from an agriculturally based one to a market economy. The introduction of capital lured many men into the oceans in search of personal fortune. However, those sailing for the Portuguese Crown did not have as many opportunities to gain vast amounts of treasure. All of the discoveries made by Portuguese sailors were claimed exclusively by the Portuguese Crown, and all commodities became a part of the royal monopoly. While the explorers usually received rewards and other benefits from the king, they did not receive any revenues from the discoveries.

Conversely, the Spanish Crown did not have a large amount of money to back such ventures, so private entrepreneurs, who received a return by earning percentages of the revenue of whatever commodities they found, mostly funded their explorations. The close control of the Portuguese

king over the trade and exploration routes sometimes caused conflicts between the Crown and its sailors. For instance, Ferdinand Magellan attempted to convince King Manuel I in 1517 to allow him to form an expedition with the purpose of discovering a westward route to Asia. The king denied this request; the Portuguese were making great headway in the Pacific and had no need to spend money on such a risky venture. Angered, Magellan went to Spain and eventually took his plan to Charles V, who agreed to partially fund the expedition, which departed in 1519 and eventually circumnavigated the globe (although Magellan died in the Philippines and never saw the voyage end). Magellan was not the only explorer who changed nationalities in order to either carry out an idea or to gain greater wealth than would have been possible at home. The option of privately funded ventures lured many to turn their backs on their native soil, therefore causing some to compromise loyalty to their king in exchange for individual gain.

—Monique Vallance

but also gave the monarch a vehicle for rewarding the nobles. However, the rewards gained by the nobles did not extend to the commoners, which created a crisis of loyalty in that section of society. No longer could a noble simply call up a garrison of men for fighting his causes; the causes now belonged to the king. However, the people would no longer fight without some type of reward. By the sixteenth and seventeenth centuries, men expected pay in order to serve in the army. This complicated matters for the royal treasury, as it amplified the cost of war. Now that coin rather than loyalty was what tied the men to the battlefield, it took a steady stream of coins to keep them there. The use of mercenaries also became more common during this period. As standing armies now became the norm, the need for soldiers grew faster than the populations could provide. However, mercenaries tended to be ruthless toward their adversaries, especially toward noncombatants. Mercenaries were notorious for pillaging villages, raping

women, and other sorts of crimes, especially when their payments were not timely. Soldiers were also known to desert whenever they did not receive their pay, which happened often.

Even during revolts, when it might be expected that the soldiers' primary concerns would be the cause rather than rewards, the men still expected to be paid, and sides won or lost based upon the amount of coin they had. In some cases rebellions needed the aid of larger, richer countries that could provide more troops and money to keep the war going. Oftentimes this provided monarchs with the ability to interfere and sabotage rival powers. For example, when the Dutch revolted against the Spanish at the end of the sixteenth century, England was able to send money and troops to aid the Dutch. This gave Elizabeth I the opportunity to both aid another Protestant country in rebelling against a Catholic one and to help sabotage the internal affairs of Spain, one of England's most bitter rivals. This could all be done without formerly

declaring war, and if the Dutch lost, then the English did not lose much. The French used this same tactic against the Spanish in 1640 when both Portugal and Catalonia rebelled. Cardinal Richelieu was quick to offer help to both of the rebels in the hopes that fighting against these two would tie up Spain and cause it to lose the Thirty Years' War.

The centralization of power and the growing bureaucracy that resulted also caused people to evaluate where their true loyalties lay. The size of the armies and number of wars were growing faster than the treasuries could keep up with, causing major financial strains on many of the larger kingdoms. Spain was especially vulnerable to these issues. The Spanish kingdoms had slowly unified since the reigns of Isabel of Castile and Fernando of Aragon, but the unification of the Iberian Peninsula was not complete until 1580, when Philip II managed to incorporate Portugal as well, although it was run as a composite kingdom rather than one unified entity. However, the pressures of added territories to guard overseas plus the ongoing Dutch revolt, Thirty Years' War, and Franco-Spanish War caused so much pressure on the royal treasury that it went bankrupt three times between 1580 and 1640. To the Count-Duke of Olivares, Philip IV's closest minister, the only answer was to tax the other kingdoms more in order to help pay the burden. This increase in taxes caused outrage among the Portuguese and Catalonians in particular, who both revolted in 1640. They objected strongly to the taxes because they still viewed Philip as a foreign king and resented having to fund the wars. The Thirty Years' War and the Franco-Spanish War also caused pressure on the French treasury, leading Cardinal Mazarin to increase taxes on the peasants and attempt to tax the nobles. The French nobles had enjoyed exemption from taxation as part of their ancient privileges. This attempt at taxation resulted in the Fronde, which lasted from 1648 to 1653. These revolts show that even after the medieval period was long gone, loyalty was still a question of perception: the claim of a king to a title was not enough to win the loyalty of his subjects. Ancient identities and loyalties were very hard to forget.

Dutch Policy in the East Indies

Dutch expansion into Oceania and Southeast Asia in the early seventeenth century was dictated by the mercantilist objectives of the States-General of the United Provinces of the Netherlands. Following the lead of the Portuguese, Dutch merchants were well aware that these regions were key sources of spices and other commodities that would be purchased at high prices back in Europe. The wealth of the United Provinces, which had significantly depended on textile industries and other forms of early manufacturing traded throughout much of Europe in prior centuries, had established a close connection between governing authorities and commercial interests. Thus, the expansion of the Dutch into what was the purview of the Portuguese brought with it a more aggressive foreign policy. Late in the seventeenth and early eighteenth centuries, English expansion into the region would also force the Dutch to engage militarily and diplomatically to protect their commercial interests.

In 1601 the Dutch States-General established the Dutch East India Company (Vereenigde Oostindische Compagnie, or VOC), which was effectively a trade monopoly and a de facto agent of the government. This occurred as the Dutch rapidly displaced the Portuguese as the major European commercial power in the region, more indicative of Portuguese decline in their economic influence

► THE DUTCH AND THE EAST INDIES— MODERN IMPLICATIONS

In light of the relationship between the Netherlands and the East Indies that began in the seventeenth century, control of this region served to ensure the continued self-importance of the Netherlands as a Great Power despite its decline vis-à-vis Britain, France, and Germany in the eighteenth and nineteenth centuries. Moreover, the East Indies was seen as pivotal, if not absolutely necessary, for the Dutch government throughout the seventeenth to twentieth centuries. Regardless of conquest by the French and commercial domination by the British, Dutch retention of the East Indies, until 1949, served to ensure its national pride. In spite of the loss of the East Indies in its decolonization of the mid-twentieth century, the influence of Indonesian culture is seen in the modern Netherlands in the form of cuisine and a sizable Indonesian diaspora.

—*Abraham O. Mendoza*

in the region than anything else. The VOC established contracts with suppliers in the Moluccas and other entrepôts in Indonesia, seeking to lock out their English competitors. The VOC was able to formulate treaties, seize land, and build fortifications and settlements. Conflict with English expansion in the region inexorably led to hostilities between the two European powers. Given the amount of wealth derived from the lucrative spice trade in the Moluccas and the greater East Indies, it was imperative for the Dutch to drive out the English and ensure their revenues. Given that the Dutch government shared the same interests as the mercantile elite, this meant war with England. Thus, Dutch foreign policy was mostly guided by commercial interests back in the Netherlands, directly tied to the highly influential commercial classes.

Moreover, in light of the necessity of trade wars with Portugal and England, it was also imperative for the VOC to form alliances with local authorities in the East Indies, which would prove to be not only loyal trading partners but also amenable allies in the struggle to oust other European powers in the region. This was done more effectively through securing contractual

obligations that essentially ensured trade only with the VOC so that England could not penetrate the same sources. Furthermore, this also ensured regional recognition of Dutch commercial and military supremacy in the region, at least with other European powers. The VOC, as a direct government agent, had the authority to conduct all these affairs, given that it was reflecting the commercial interests of a mercantilist-minded Dutch elite and governing authority. In light of ebbing English and French interest in the East Indies and their growing commercial expansion in South Asia, the Dutch slowly found themselves in almost full possession of the spice and commodity market of the East Indies by the late seventeenth and early eighteenth centuries.

In spite of their ability to secure a near monopoly of commercial hegemony in the East Indies, the Dutch were hard-pressed by the English in European and American markets. The English pursued a more aggressive stance militarily vis-à-vis the Dutch, triggering a series of conflicts known as the Anglo-Dutch Wars in the mid-seventeenth century. While these wars were fought primarily for reasons of trade, they also exhibited the growing European rivalries for global expansion in which the Dutch were directly involved in the East Indies and Surinam. In spite of these mostly European confrontations, the Dutch were able to retain their commercial empire in the East Indies, as the VOC had been able to ensure its security by providing steady supplies of commodities and revenue to the governing authorities back in the Netherlands. Nonetheless, these conflicts also made the Dutch aware that the English and the French could also hold sway over their own spheres of influence in South Asia, which were effectively held in the same manner by the English East India Company and the French East India Company (which would result in similar patterns of establishing local alliances in an attempt to oust competitors). In the eighteenth century South Asia would become an English commercial zone of influence, much in the same way as the East Indies were primarily Dutch, effectively following policies similar to those of the Dutch in regard to commercial and state interests.

Dona Marina and the Conquest of the Aztecs

Dona Marina, also known as La Malinche or Malintzen, was an Aztec woman who played a key role in Hernando Cortes' conquest of the Aztecs. A convert to Christianity, Dona Marina was Cortes' interpreter and relayed his words to the Aztecs and other Native American peoples. Thanks to her, Cortes was able to build up a coalition of peoples who opposed Aztec domination and overthrew their empire. As a result, some later historians have portrayed her as a traitor to the Native American cause. The term *malinchismo*, derived from the Spanish nickname for Dona Marina, has come to mean a tendency to embrace foreign ideas and values while rejecting native ones. Others view her as one of the first citizens of the Mexico that was created by the conquest and as a strong and capable woman.

Dona Marina was born around 1504 in the Gulf Coast region of the Aztec empire. Her father was a chieftain. After he died, her mother remarried and had a son. Dona Marina's stepbrother replaced her in the succession, and she was sold into slavery among the Maya who lived near Cintla. Dona Marina soon learned Chontal Maya as well as her native Nahuatl, the language of the Aztecs.

Cortes and his expedition landed first on the island of Cozumel in 1519. They soon found a Spaniard named Geronimo de Aguilar who had been shipwrecked years earlier. From his time with the natives, he had learned the Maya language. Aguilar was able to direct Cortes toward the south, around the Yucatan Peninsula. They landed at Potonchan on the Gulf Coast. After a

Dona Marina translates between Cortes and the Aztecs, 1519, from Lienzo de Tlaxcala, sixteenth century. (The British Library/StockphotoPro)

battle with the local people, Cortes reached an agreement with the chieftain of Tobasco. He sent gifts to Cortes including 20 young women, among them Dona Marina. At first she was given to one of the other Spanish leaders. She converted to Christianity and received the name Dona Marina.

When Cortes pushed inland, he realized that the local people spoke not Mayan but Nahuatl. Aguilar was not able to translate for him. Cortes quickly found that Dona Marina could understand the language. From that point on, she remained close to Cortes. Aztec emissaries spoke to Dona Marina, who translated their words into Mayan for Aguilar. Aguilar in turn translated the words into Spanish for Cortes. The same awkward process was repeated when Cortes spoke to the Aztecs. Dona Marina soon learned Spanish, thus removing the need for Aguilar.

Dona Marina became Cortes' mistress as well as his translator. She was constantly by his side. In *The History of the Conquest of Mexico*, William Prescott claimed that Cortes was called "Malinche" (captain) by his men. By extension, Dona Marina became "La Malinche" (captain's woman). She bore Cortes a son named Martin Cortes who became the first recorded child of Spanish and Indian parents and, some historians assert, the first modern Mexican. The relationship between Cortes and Dona Marina seems to have been a deep one based on mutual respect.

She displayed a quick intelligence and ability as well as a deep devotion to her new faith. He refused other women offered to him on the campaign, and Dona Marina was regarded by Spanish and Indian alike as Cortes' alter ego.

Through Dona Marina, Cortes was able to gather much information about the Aztec empire. He realized that many of the peoples they dominated would be willing to join him to overthrow the Aztecs. After forming an alliance with the Totonac, Cortes moved on the Tlaxcalans, who had successfully resisted the Aztecs' conquest. After initial conflict, the Tlaxcalans negotiated an alliance with Cortes, thanks to Dona Marina. When Montezuma sent ambassadors with gifts to the Spaniards, Dona Marina interpreted their message and helped formulate Cortes' response. After Cortes and his allies reached Tenochtitlan in November 1519, Cortes and Montezuma met on the edge of the city. Again, Dona Marina served as translator.

Dona Marina continued to translate for Cortes in the negotiations that followed. He tried to convince Montezuma to accept Christianity and an alliance with the king of Spain. At a private meeting with only Montezuma, Cortes, and Dona Marina present, Cortes claimed that he had permission to place a cross and an altar in the main Aztec temple. An uprising followed, with Montezuma being killed in the fighting. The Spaniards fought their way out of the city on July 1, 1520. Nearly half of them died. Dona Marina reportedly rode on the same horse as Cortes during the retreat and survived.

The Aztecs failed to follow up their success, and Cortes rebuilt his army with Spanish reinforcements and Native American allies, such as the Tlaxcalan. His Indian allies remained loyal, thanks in part to Dona Marina. He returned and took Tenochtitlan after a five-month siege. Cortes spent the next few years pacifying the remainder of the country. When his wife arrived from Spain, Cortes arranged for a marriage between Dona Marina and a Castilian knight, Don Juan Xamarillo. Before she disappeared from history, Dona Marina was reunited with her mother and her stepbrother in 1523. She embraced them and forgave them for selling her into slavery. After giving them gifts, she sent them home.

European Traders and the Tupi in Brazil

Tupi (Too-PEE) refers to a common language spoken among numerous tribes who populated the coast of Brazil at the time of its discovery by the Portuguese in 1500. The word also applied to the natives who spoke this language, divided into tribes such as the Tamoyo (Tah-MOH-yoh) and Tupinamba (Too-pee-nahm-BAH). Their language was related to Guarani (Gwa-rah-NEE), spoken among the indigenous populations of southern Brazil, central Paraguay, and Bolivia. Tupi-Guarani was a lingua franca or common language for the inhabitants of this vast swath of eastern South America and served as a means of communication for barter and negotiation, which extended into the Andes and Inca territory using a complex network of footpaths.

The Tupi-Guarani did not have the same level of sociocultural development as that of Inca, Maya, or Aztec societies. Nor had the Tupi-Guarani developed complex organizations with permanent settlements, elaborate hierarchies, religious structures, or aesthetics. Rather, the Brazilian indigenous population functioned at a more basic level of social development, relying on seminomadic hunting and gathering for sustenance. Nonetheless, these societies were growing in population, increasing the density of occupation of fertile lands. The Tupi-Guarani had, for example, driven the Gê (Jay) Indians from the Atlantic coast into the Brazilian highlands and engaged in extensive, almost continuous, tribal wars.

In 1500 a Portuguese naval fleet landed along the northeastern coast of South America, claiming the land, which they initially thought was an

island, for their king. At the time, Portugal was among the leading maritime trading empires of the world and sought control of the eastern coast of South America for the wealth, particularly gold, that they hoped it would contain. Indeed, over the next several decades their Spanish rivals would find a wealth of precious and semi-precious minerals in Mexico, Central America, and the western coast of South America.

The indigenous tribe that the Portuguese encountered was the Tupiniquim (Too-pee-nee-KEEM). Initially the relationship of the Portuguese with this and other tribes would be peaceful. Indeed, a scribe on the Portuguese ships described the natives “as more comfortable with us than we with them.” The Portuguese ambition was not to extensively settle or occupy the lands they had already discovered in Africa and Asia. Their primary ambition was to establish coastal trading posts with fortresses if necessary, thereby obtaining products such as ivory, gold, slaves, spices, luxury goods, and other exotic materials for sale in Europe or other parts of their empire.

The land that the Portuguese found in South America offered little of exceptional commercial value except for one thing. A tree grew there in abundance from which a red dye could be extracted. Such a dye was much in demand among European cloth makers. The tree was named *pau-brasil* (POW bra-ZIHL) or brazilwood, a type of wood that, when processed, dyes to an emberlike tint. The finest-quality brazilwood, denominated “pernambuco,” was used in the making of musical instruments, especially bows for string instruments. The tree was harvested to such an extent in the Portuguese-occupied area of South America that the region came to be identified with it and known as “Brazil.” One of the oldest provinces from which brazilwood was harvested was Pernambuco. Indigenous groups felled and loaded these trees onto Portuguese ships in exchange for fabrics, trinkets, and other manufactures. In addition to the dyewood, the Portuguese also traded for exotic fauna, such as parrots and monkeys, that were of great curiosity in Europe. Several sailors remained in the newly found tropical land, establishing a tradition of miscegenation with the native population.

Tupis, indigenous Brazilians, harvest brazilwood for export in this scene by sixteenth-century Franciscan priest André Thevet. (Library of Congress)

A European rival, France, wished to break the Portuguese monopoly on this dyewood trade. France had a developed textile manufacturing and commercial system. Only a few years after the Portuguese discovery of Brazil, the French made advances into it, which they referred to as the “Land of Parrots.” They raided Portuguese ships laden with brazilwood. Attempting to establish a French colony, they settled an area south of the Portuguese near what is today the city of Rio de Janeiro. They traded with the Tupinambá (too-pee-nahm-BAH) and Tamoio (tah-MOY-yoh). To secure this trade, the French decided by the mid-sixteenth century to settle a colony there, using an island in the bay of Rio. The French considered this area France Antarctique (Antarctic or Southern France).

This French area lay between Portuguese-occupied areas of northeastern and southeastern Brazil. The Portuguese, in alliance with their indigenous trading partners, resolved to expel the French. A war ensued in which the French fought in alliance with their indigenous allies. The Portuguese were triumphant, expelling the French and in 1565 founding Rio de Janeiro as a Portuguese fortress and settlement.

By now, however, the economic role of Brazil for Portugal was changing. Rather than

➤ HANS STADEN AND THE TUPINAMBA

One of the earliest means by which Europeans of the sixteenth century learned of the indigenous populations of Brazil was through a book, *Hans Staden: The True History of His Captivity*. Published in 1557 in German, the work was by a German soldier who had sailed twice to Brazil on Portuguese ships. On the second voyage, in 1547, he was shipwrecked off the southeastern coast of Brazil. Surviving the shipwreck, he joined the artillery at a local Portuguese fort.

Tupinamba Indians besieged the fort in 1552, and Staden was captured. The Tupinamba were reputed for their cannibalism, and Staden assumed that they would also consume him. Cannibalism was considered a ritual way of conclusively defeating one's enemy and of absorbing that person's strength. Staden attempted various ruses in order to delay his fate.

He tried to explain to them that he was not Portuguese, the nationality of their enemy, but German. The tribal chief, however, did not understand or accept this distinction. Indeed, he

believed that Staden was trying to pass himself off as French, allies of the Tupinamba, when he was really Portuguese. Progressively learning Tupi, Staden used rudimentary medical skills to convince them of his power and usefulness to them. European diseases, however, liberated him. The Tupinamba fell victim to illnesses for which they had no immunity, and Staden thereby escaped.

Returning in 1555 to his homeland, two years later he published an account of his capture. The work became widely successful and was translated into various languages. It caused a sensation because of its numerous woodcut illustrations of cannibalism, depicting the Tupinamba stewing a human head or roasting a human body. Of more substantial and unique historical value, however, were what Staden recorded of the Tupinamba practices for food production and preparation, crafts, mating, family, religion, and social and political organization.

—Edward A. Riedinger

dyewood, sugar grown on vast plantations was proving much more profitable. Moreover, a better form of labor for such work became slaves imported from Africa. The indigenous population was alien to such settled, controlled labor, and its numbers had radically diminished. From hundreds of thousands settled along the coast, their numbers fell by an estimated 90 percent. This reduction occurred primarily because of exposure to European diseases to which the native population had no immunity. However, numbers were also reduced due to warfare with the land-hungry Portuguese. Their occupation of vast swaths of lands could not be checked by the Tupi-Guarani, who had scant defense against European weapons.

For the same reasons, the millions of natives who occupied the vast territory of modern Brazil, from the Atlantic to the Amazon River, were likewise decimated. Brazilwood itself fared little better. Within two centuries of their first harvesting,

tens of millions of trees had been felled. The tree is nearly extinct today, as are many of the remaining indigenous tribes in Brazil.

Thought and Religion

By the beginning of the early modern period, the religious and intellectual systems that governed most of the civilized world were centuries and in many cases millennia old. These systems organized the devotion of civilized and nomadic populations, served as bases for political legitimacy, dominated education, and provided the substance for the intellectual life of scholarly elites. Foremost among these religious traditions were Christianity in Europe, Ethiopia, and minority communities in the Middle East; Islam in a vast area stretching from central Asia to Indonesia to West Africa; Hinduism in India and offshoot cultures in Southeast Asia; Buddhism in much of Southeast, Central, and East Asia; and Confucianism in China and its East Asian cultural satellites. However, these “universal” religions and philosophies had not completely displaced older traditions of local worship, which continued in many parts of the world as well. These local religions, many of which incorporated shamanistic elements, were particularly strong among agricultural and hunter-gatherer populations and in the Americas, Africa, Australasia, and northeastern Asia. In Hindu India and China they persisted alongside the great religious systems.

Religion dominated intellectual as well as devotional life, although the great religions were joined by the tradition of ancient Greek thought, particularly the works of Aristotle, which played a central intellectual role in the Christian and Islamic worlds.

These great religious and philosophical systems were based on ancient and early medieval texts, many of which were written in languages that were no longer in daily use. Some of these ancient texts were sacred tomes that claimed divine inspiration, such as the Vedas of Hinduism, the Torah of Judaism, the Bible of Christianity, and the Quran of Islam. Some were more secular, such as the body of Greek philosophy, the Five Classics and the Four Books of Chinese Confucianism, or Judaism’s compendium of legal opinions, the Talmud. Each of these texts had also produced voluminous commentaries. To be a scholar was to master a set of ancient texts and the sacred languages in which they were written: Sanskrit for the Vedas, Hebrew for the Torah, Classical Chinese for the Classics, and so on. Buddhism and Christianity were more flexible about translating texts than were the other major traditions, for which the sacredness and authenticity of texts were embedded in the language in which they were written.

The class that interpreted these texts was the dominant intellectual and religious class in early modern societies. They included the priesthood of Christianity, Islam’s ulema, the scholarly Brahmins of India, and the Confucian scholars of China. Although state support underlay the power of these intellectual elites and the persistence of many of these

traditions, strictly speaking it was not necessary. Jews were a marginalized community throughout the world, yet without control of any state government they maintained a rich textual tradition and a professional intellectual class of rabbis. The Buddhist and Daoist traditions in China survived and sometimes even flourished despite the state's favoring of Confucianism.

The traditions also dominated the world of educational institutions, from the Confucian academies of China to the madrasas of Islam to the yeshivas of Ashkenazi Jewry and the church-affiliated universities of Christendom. The texts and languages of the classical traditions dominated the curriculum, and expertise in ancient texts was the mark of the educated man, as few institutions of higher education took much note of women.

Many societies were heirs of different, even conflicting, traditions. Latin Christendom was the heir both of the early Christians and of the "classical" tradition of ancient Greece and Rome. India had both indigenous Hinduism and imported Islam. China had the sometimes conflicting traditions of Confucianism, Buddhism, and Daoism. Japan had both a Buddhist and Confucian tradition imported from China as well as an indigenous tradition of "national" learning. In general, East Asians could participate in several religious traditions, while in the Western world religions were viewed as mutually exclusive.

Traditions were also divided. Islam was divided into the Sunni and Shia, and Christianity was divided into the Eastern tradition of Orthodoxy and the Western tradition of Roman Catholicism. Western Christianity would further fissure in this period with the rise of numerous Protestant groups, many of which would continue to subdivide. The intellectual dominance of the Neo-Confucianism of the Song dynasty

philosopher Zhu Xi would be challenged first in the Ming by the subjectivist and intuitionist school of Wang Yangming and then in the Qing by the antiquarian and philological *kaozheng* school. Buddhism, the most fragmented of the major traditions, was divided into the two large schools of the Mahayana and the Theravada and then into numerous smaller

Buddhism, the most fragmented of the major traditions, was divided into the two large schools of the Mahayana and the Theravada and then into numerous smaller schools, often fiercely at odds.

schools, often fiercely at odds. However, the early modern period was not marked by the growth of entirely new religions with the exception of Sikhism, an Indian religion that drew from the already-established traditions of Hinduism and Sufi Islam and established its own canon of sacred texts.

Not all religious leaders founded their authority on learning and textual expertise. Hindu ascetics, Sufi sheiks, and Christian preachers and mystics claimed a more direct connection with God. These figures often had difficulty with textually based authorities, as did those who interpreted texts in a nonstandard way, referred to as "heretics." Holy individuals, such as the Bodhisattvas of Mahayana Buddhism or the saints of Roman Catholicism, competed with and often triumphed over texts as objects of popular devotion. In Islam and Christianity, religious

authorities were often suspicious of popular devotion and called for a return to a religion based strictly on the text, a concept that underlay Protestant Christianity and numerous Islamic reform movements such as the Wahhabism of the eighteenth-century Arab reformer, Muhammad Ibn ab-dal Wahhab. Catholicism, Orthodox Christianity, and Buddhism tended to be more tolerant of devotional cults.

The scholarly traditions of religious and intellectual leadership were male traditions, and the charismatic tradition of religious leadership was male-dominated. The religious and intellectual professions were reserved for males, as were the major educational institutions. Women occupied a marginal intellectual role at best, although Catholic Europe and Buddhist Japan did provide an institutional religious role for them as nuns, where they had better access to education and ultimately to power.

The two traditions that were expanding the most rapidly in the early modern period were Western Christianity, in both its Catholic and Protestant forms, and Islam. Although Catholicism lost much of northern Europe to Protestantism, the expansion of Catholic empires—the Spanish and Portuguese in the beginning of the period and later the French—made it the first truly global religion, with a presence in every inhabited continent except Australia, of whose existence Europeans were ignorant. Catholicism's spread was also facilitated by dedicated members of religious orders who could engage in missionary efforts without the responsibilities of marriage and family and brought Catholicism to places where it could not be imposed by imperial force, such as China, Japan, Vietnam, and native communities in Canada. The new challenges presented by both globalization and the rise of Protestantism led to the creation of new religious orders, of which the most influential was the Society of Jesus, or Jesuits, who assumed a leading role in intellectual as well as religious life.

The maintenance of some degree of uniformity over this vast space of early modern Catholicism was eased by its unparalleled tradition of centralization, in which a small group of men in Rome were responsible for the direction of a worldwide church. The reaction to the Reformation actually strengthened Catholic centralism with the rise of institutions such as the Roman Inquisition and the Index of Forbidden Books as well as the definitive statement of Catholic doctrine issued by the Council of Trent. Uniformity in doctrine and to a lesser extent practice was actually rising. Despite the maintenance of Catholic uniformity, however, various local indigenous cults took root, such as that of the Virgin of Guadalupe in Mexico, which combined Catholic devotion to Mary with elements of pre-Columbian Mexican devotion to goddesses. Islam lacked Catholicism's central institutions but through such practices as the annual hajj pilgrimage to Mecca, which attracted devotees from all over the Islamic world, and the promulgation of Quranic Arabic, managed to also maintain a relatively high degree of standardization. Islamic unity was also aided by the Dervish brotherhoods such as the Nashqbandi, with branches from Turkey to China.

Catholicism's centralization also enabled it to be an effective religious persecutor, one of the few faiths to enforce a religious monopoly.

The expansion of Catholicism resulted in the effective end of indigenous American religious and intellectual traditions. Many Mexican and Central American documents were destroyed by the Spanish, who connected them with the Devil, and the practice of indigenous religious traditions was banned. Catholicism also opposed pluralism in Catholic

One of the Catholic Church's few rivals as an enforcer of religious uniformity was the Japanese Tokugawa government, which after turning against Catholic missionaries rooted out Japanese Catholicism over decades, leaving only a tiny isolated population.

societies. The rise of Spain and Portugal to world power was accompanied by the elimination of overt practicing Jewish and Muslim populations from the home countries. One of the Catholic Church's few rivals as an enforcer of religious uniformity was the Japanese Tokugawa government, which after turning against Catholic missionaries rooted out Japanese Catholicism over decades, leaving only a tiny isolated population. Protestant churches such as the Church of England also attempted

to enforce uniformity, as did the Shia Islamic Safavid Persian state but with less success. Other states such as the Ottoman empire, the Dutch Republic, and China maintained a high degree of religious tolerance, although no state lacked an official religion or treated all religious traditions on a footing of equality.

Although Protestant churches did not attain the global reach of Catholicism in this period, they too grew with the expansion of European empires. Protestant missionary efforts were handicapped by the fact that Protestant ministers, unlike celibate Catholic clergy, had family obligations. The most impressive example of Protestant globalism was the spread of British Protestantism in North America, where a broad range of Christianities flourished and some Native Americans were converted. Protestantism ranged from the Church of England in the southern colonies to the Calvinists of New England to the Quakers of Pennsylvania. The addition of non-British Protestantism, such as the Lutheranism brought by German immigrants, Roman Catholicism, and Judaism helped make British North America one of the West's most religiously heterogeneous communities.

Islam was also growing, although its path of expansion was slower, less dramatic, and more continuous with its medieval tradition than was Christianity's. Islam continued to grow in Africa, the Indian Ocean region, and Asia as well as moving into southeastern Europe with the expansion of the Ottoman empire. The eighteenth-century retreat of Islamic states did not in most cases mean the retreat of Islam, which proved able to survive in areas such as Russian or Chinese central Asia that had left Islamic sovereignty. Other religions that expanded in this period included a Buddhist sect, the Yellow Hat Lamaism of the Tibetan Dalai Lamas that expanded from its Tibetan base to east central Asia and Mongolia.

Although all areas were changing and developing religiously and intellectually, the most dramatic changes were occurring in the area of Latin Christendom. In addition to the Protestant Reformation and the global expansion of Catholicism, the West was also the area of

intellectual revolution. This began with the recovery of much of the classical corpus, particularly Greek works of philosophy and science, by Western “humanists” who despite the fact that many of them were priests based their claims to knowledge on secular rather than religious expertise. The revival of knowledge of classical Greek in the West, facilitated by the Byzantine decline that sent many Greek scholars westward, opened up an intellectual world. Incorporating this knowledge as well as the new knowledge being brought back from European explorers, conquerors, missionaries and settlers around the world required fundamental changes in the Western view.

Contact between intellectual and religious traditions was a two-way process, and direct contact with Westerners and the Western intellectual and religious tradition, often mediated by Jesuits, influenced the societies of Mughal India, Ming and Qing China, Japan, and other Asian societies. In eighteenth-century Japan where this process went furthest, Western learning provided a vantage point to criticize the historical dominance of Chinese thought and contributed to a growing intellectual pluralism.

By the late seventeenth century the West also had become more intellectually plural. Although virtually every thinker was either a Christian or paid lip service to Christianity, both ancient and modern secular models were increasingly influential. The religious divisions of the West tended to discredit religious repression and religious violence generally as well as promoted a secular scholarly study of the historical nature of religious texts with a contemporary Chinese parallel in the *kaozheng* movement. The Scientific Revolution and then the Enlightenment began to make a virtue of the break with the past and even the proclamation of religious unbelief. Thinkers such as the French Catholic René Descartes and the heretical Jew Baruch Spinoza proclaimed the entire ancient classical tradition as fundamentally in error in certain areas and, in Spinoza’s case, went on to question the religious traditions of Judaism and Christianity as well. One of the most dramatic aspects of the new thought of the Enlightenment was the fact that women were now able to play a public role as intellectuals and in a few cases, like the Italian Laura Bassi, even as academics.

■ Introduction: Invention and Innovation in Ways of Thinking

The early modern period was a great age of intellectual innovation. In European civilization, this was the period that spanned the Renaissance, the Protestant Reformation, the Scientific Revolution, and the Enlightenment. Numerous factors drove this wave of innovations. The printing press allowed for the more

rapid dissemination of texts and images in more accurate copies and drove an increase in literacy and the rise of new reading publics, which in turn drove intellectual innovation. Humanism led to the rediscovery and revival of numerous ancient texts, which in turn inspired new ideas. The rediscovery of the Greek language, assisted

by the Greek scholars who left Byzantium for the West during that empire's fifteenth-century decline, opened a dazzling range of new intellectual worlds. Ancient philosophies such as Platonism, Skepticism, Stoicism, and Epicureanism, ignored during the Middle Ages in favor of the Aristotelian tradition, were revived. Even the understanding of Aristotle was transformed. Catholics and Protestants, locked in a struggle for intellectual as well as religious supremacy, revolutionized the scholarly understanding of church history and theology.

Other civilizations also continued to develop their intellectual and religious traditions although not as dramatically as the Europeans. India saw the founding of a new religion, Sikhism, from the contact of Hinduism and Islam. New schools of Confucian thought emerged, such as the individualist “school of Wang Yang-Ming” and the antiquarian *kaozheng* scholars of the Qing period. The rise of the Dalai Lamas to power in Tibet was accompanied by the dissemination, sometimes by force, of the *gelugpa* or Yellow Hat school of Buddhism. Mulla Sadra in seventeenth-century Persia created a powerful intellectual synthesis of Shiite Islam, Aristotelianism, and mysticism that would influence Islamic philosophy to the present day.

The growing global contacts of the early modern period also drove intellectual innovation. Different cultures confronted each other's ideas. Traditional African cultures faced challenges from both Islam and the Christianity of the Europeans who established trading bases on the African coast. Chinese and Japanese intellectuals chose to reject or accept Christianity and in either case had to define the relation of the new ideas to the ones they learned from their own traditions. Jews, a community kept in constant motion by hostility of the societies they lived among, were exposed to different cultures and both originated and disseminated a wide variety of new ideas, from the mysticism of Rabbi Isaac Luria and the Safed Kabbalists in the Islamic Ottoman empire to the rationalism of Baruch Spinoza in the Christian Dutch Republic. European Christians, who instigated much of this contact, were faced with a flood of new information coming from all parts of the world, which somehow had to be integrated into their worldviews.

(European expansion led to the destruction of intellectual traditions as well as intellectual innovation. The intellectual and religious heritage of pre-Columbian American civilizations were largely lost in the European conquest.)

The combination of the revival of the ancient thought of the pagan Greeks and Romans in the European Renaissance and the increased contacts with the rest of the world in the Age of Discovery vastly broadened European awareness of other societies in both space and time. Exposure to ancient and foreign cultures tended to loosen the grip of Christianity on European intellectual culture, as did the increased importance of the divisions between Christians themselves in the Protestant Reformation and the era of religious wars that followed. European thought became increasingly secular. Writers such as the Italian courtier Baldassar Castiglione took a greater interest in the development of the individual in this world. The techniques of analysis of classical texts developed by European humanists in the Renaissance could be turned on the sacred texts of Christianity themselves, and although many who did this remained devout Christians, some saw the Bible as a secular text like any other. The competing claims of a variety of claimants to religious truth combined with the revival of ancient skeptical philosophy to produce a suspicion of all claims to intellectual and spiritual authority. Although few, even in the eighteenth century, were prepared to openly reject Christianity, European philosophies became increasingly based on reason rather than revelation. Seventeenth-century rationalist philosophers such as Spinoza and the Frenchman René Descartes presented their ideas as revolutionary innovations rather than continuations of classical or medieval philosophies. The success of science, particularly after the seventeenth-century Scientific Revolution, also lent prestige to intellectual innovation and secular thinking.

—William E. Burns

China's and Japan's Christian Centuries

During the early modern period, China and Japan experienced what historians refer to as Catholic centuries. In China, the era of Christian

conversion lasted from about 1600 to 1800, spanning the Late Ming (1348–1644) and early Qing (1644–1911) dynasties. Japan's Christian century, according to historian C. R. Boxer, extends from roughly 1550 to 1650, although the practice and proselytizing of Christianity was officially proscribed by the Tokugawa regime in the 1620s. While the conversion project was largely dominated by the Society of Jesus (or Jesuits), the Dominican and Franciscan orders also sent missionaries abroad to bring the gospel to East Asia and the Pacific.

While the resurgence of Catholic missions began as a response to the sixteenth-century Protestant Reformation in Europe, the scope of Counter-Reformation was clearly not limited to fighting heresy on the continent. The aggressive work of the Catholic missionary orders was part of a worldwide campaign to reinvigorate the Church's evangelical tradition by spreading the teachings of the gospel in areas of the world that had been more or less isolated from Europe until the early modern age of exploration. Because China and Japan were considered to be ancient, politically complex, and philosophically advanced civilizations, the strategies for conversion used in these countries differed widely from those used in the American hemisphere.

The Jesuits (founded in 1540) were especially effective in China, focusing their conversion efforts on members of the intellectual elite. Exploiting the philosophical similarities between Confucian and Christian ethics, the missionaries portrayed Christianity as a natural fulfillment of the ideas of humanity, filial piety, and virtue, long understood as the defining qualities of the Confucian gentleman-sage (*shi*). The Jesuits, whose missionary work was based on education, also represented the cutting edge of learning and technology for Chinese scholars. Their familiarity with mathematics, astronomy, mapmaking, and engineering and their seemingly prodigious ability to learn Asian languages earned them the credibility needed to capture the hearts and minds of the Chinese imperial elites. Matteo Ricci (1552–1610), Adam Schall (1591–1666), and Ferdinand Verbiest (1623–1688) were three Jesuits whose knowledge of Western science and appreciation for the subtleties of Chinese society made them

An illustration from a Chinese manuscript of the Jesuit missionary to China, Matteo Ricci, and his first convert. (Hulton Archive/Getty Images)

effective enough to be appointed to office in the Chinese court.

The Jesuit practice of accommodating Chinese traditional beliefs was also evident in the definition of God. While the Chinese had long worshiped a deity known as Shangdi ("Highest Lord") and venerated the idea of Tian (Heaven), the idea of a transcendent Father-God was nevertheless alien to Chinese thought. The term "Tianju" ("Lord of Heaven") was employed to invoke the omnipotence of the Christian God, an expediency that ultimately failed to do justice to either the Christian or Chinese ideas of a supreme deity.

All told, more than 1,000 missionaries worked in China during the seventeenth and eighteenth centuries, and they succeeded in gaining roughly 250,000 converts. Among these were the so-called Three Pillars of the Christian Church—Wu Guangqi (1562–1622), Li Zhizao

(d. 1630), and Yang Tingyun (1557–1627)—all scholars who saw in Christianity not only a doctrine of salvation but also the core of an elevated intellectual tradition.

The fortunes of Catholic missions began to decline in the late seventeenth century. The famous Rites Controversy, which pitted the Jesuits against fellow Catholic missionaries and opened a permanent schism between Rome and the Chinese court, is the event that defines the ultimate failure of Catholicism in China. Essentially, the Rites Controversy was an argument between Rome and the Qing court concerning the participation of Jesuit priests in official Confucian rites. Friar Ricci himself had defined these rites as civil rather than religious ceremonies, removing any sacramental impediment for Chinese Christians to join them. For decades, the Jesuits had endeared themselves to the bureaucratic elites by their open attitude to Chinese traditions. So successful were the Jesuits in embracing the aesthetics of the Chinese elite (wearing Confucian dress, speaking Chinese, assuming Chinese names and titles, and permitting the rites of ancestor veneration) that they were accused of paganism by rival orders, such as the Franciscans. When Rome attempted to rein in the ecumenism of the Jesuits and curtail the ancestor veneration by Chinese Christians, the emperor Kangxi (r. 1654–1722) moved to restrict Catholic worship in China by expelling all priests who refused to recognize the rites. His son, the emperor Yongzheng (r. 1723–1735) went even further, ordering all priests to be confined in Canton and Macao, effectively banning the Christians from missionary activity throughout the country from 1724 on.

The Jesuits came to Japan as early as 1549 and, under the leadership of Francis Xavier (1506–1552), achieved some success during a period of great violence and political fragmentation. The Japanese missionary project, of shorter duration than China's (Catholicism was banned in 1614 and violently suppressed thereafter), was marked by its own unique conversion strategies. Making their appeals largely to mutually antagonistic warriors, the missionaries insinuated themselves in local politics and economic activities and assisted local rulers in the acquisition of European weapons and manufactured products.

Accordingly, the so-called Christian Century in Japan is often portrayed somewhat cynically, with Jesuits fulfilling the role of anti-Buddhist power brokers. Among the realities that give credence to this portrayal is the fact that each of Japan's great Sengoku (Warring States) hegemons cautiously supported Christianity during their respective campaigns to unify the country. Oda Nobunaga, Toyotomi Hideyoshi, and Tokugawa Ieyasu all sponsored the activities of Christian missionaries but arguably only to the extent that this sponsorship served their own political goals. As Japan moved closer to political unification in the 1590s, finally attaining unification in 1600, Christianity became increasingly perceived as an alien faith and a threat to the stability of the realm. In 1637 a violent social protest led by peasants and disenfranchised samurai broke out in Shimabara (southern Japan). Because many of the rebels marched under Christian flags, the Tokugawa government blamed Christianity for the insurrection and put it down with great brutality. In the following decade, the shogunate moved with deliberation to end diplomatic and economic relations with Western countries, using fear of Christian contamination as a core rationale for a long-lasting policy of isolation. Compared to that of China, Japan's era of Christian conversions was relatively short-lived. It would be wrong, though, to underestimate either the influence of Christianity on Japanese historical development in this period or the religious zeal of the Japanese Christians. The ferocity with which the Tokugawa regime attacked Catholicism, to say nothing of the devotion with which hundreds of martyrs went to their deaths, suggests that the roughly 200,000 converts to Christianity in early modern Japan were indeed sincere in their conversions and in the practice of their faith.

Resolution and Composition— The Beginnings of the Scientific Method

The Scientific Revolution of the late sixteenth and seventeenth centuries dramatically transformed how Europeans conceived of the natural world and their own place in it. Scientists and scholars utilized the scientific method developed by Francis Bacon (1561–1626) and René Descartes (1596–1650) to decipher the natural world and to understand the inner workings of the body, the Earth, and the universe. The new approach endorsed by Bacon and Descartes introduced a process that liberated scientists from the antiquated philosophies of Ptolemy and Aristotle and from the faith-dominated paradigm of the churches and enabled them to investigate the physical environment in order to transform science and technology for the benefit of humanity.

In *Novum Organum (The New Instrument)*, published in 1620, English philosopher Francis Bacon encouraged scientists to work through an inductive method. Bacon's a posteriori approach moved from examining particulars toward a general theory or from specific experiments to theories that would guide scientists toward further experimentation. He advocated that scientists conduct rigorous experiments, observe the findings and collect data systematically, and share their findings with other scientists in order to accumulate a body of knowledge that a scientific community could expand on. Bacon's method was flawed, however, by its empirical emphasis, which did not encourage the abstract thinking

necessary in the emerging fields of mathematics, physics, and astronomy.

Whereas Bacon emphasized an empirical and inductive approach, French mathematician and philosopher René Descartes presented the scientific method as an a priori means for developing theories, working from the general to the particular. Descartes's *Discourse on Method*, published in 1637, proposed guidelines for deductive reasoning that mathematicians and physicists could utilize to delve into abstractions. In order to understand the complex composition of the natural world, he maintained, scientists must examine the most basic elements that made up the physical world and deduce from these features principles that would give meaning to greater abstractions. He suggested, therefore, that scientists should pursue general laws that systematically explained the natural world and from these move on to uncover particulars.

Bacon and Descartes proposed variants of the scientific method, but both were limited in their scope and knowledge of the day-to-day workings of scientists in the field. Bacon's conception of science was so procedural that he dismissed abstractions and generalizations, causing him to ignore the strides being made in the astronomy and physics of his day. He condemned scholars such as Galileo Galilei (1564–1642) for explaining motion in mathematical formulas because their thinking was too abstract. For his part, Descartes had little experience in experimentation and became caught up in his own theoretical assumptions. He too criticized Galileo but for being far too empirical and not sufficiently abstract in his explanations.

Despite their different approaches, Bacon and Descartes contributed to a significant change in the intellectual climate of seventeenth-century Europe. The dissemination of the scientific method contributed to the growth of collaboration in scientific societies that were subsidized by governments. British monarch Charles II (r. 1660–1685) chartered the illustrious Royal Society in 1662, and French chief financial official Jean-Baptiste Colbert (1619–1683) under Louis XIV (r. 1643–1715) subsidized the Académie des Sciences in 1666. Esteemed scientists such as Galileo and Isaac Newton were members of these prestigious organizations in

► NICHOLAS COPERNICUS, EXCERPTS FROM *THE REVOLUTIONS OF THE HEAVENLY BODIES*, 1543

Utilizing specialized equipment and the scientific method to make observations and reach his conclusions, Polish mathematician and astronomer Nicholas Copernicus (1473–1543) theorized that the Earth and planets revolved around the sun. The following excerpts illustrate the line of reasoning developed by Copernicus to substantiate his findings.

“That the earth is also spherical is therefore beyond question, because it presses from all sides upon its center. Although by reason of the elevations of the mountains and the depressions of the valleys a perfect circle cannot be understood, yet this does not affect the general spherical nature of the earth.

Refutation of the arguments of the ancients that the earth remains still in the middle of the universe, as if it were its center. From this and similar reasons it is supposed that the earth rests at the center of the universe and that there is no doubt of the fact. But if one believed that the earth revolved, he would certainly be of the opinion that this movement was natural and not arbitrary. For whatever is in accord with nature produces results which are the opposite of those produced by force. Things upon which force or an outside power has acted, must be injured and cannot long endure: what happens by nature, however, preserves itself well and exists in the best condition.”

their respective countries, contributing to the collective expansion of scientific findings and research. Members of these societies collectively listened to papers, shared equipment and methods, collected samples and specimens, and reported their findings in journals. While their memberships did consist primarily of scientists, they also included dilettantes; among the most

famous was Charles II, known for tinkering with chemicals in his own laboratory.

The scientific method provided a viable set of procedures and guidelines for scientists to practice their craft. Characterized by the processes of observation, developing hypothesis or theory, experimentation, collection of data, and the drawing of conclusions from such data, the scientific method contributed to the expansive body of knowledge well into our own time. Both Bacon’s and Descartes’s contributions to both inductive and deductive procedures in experimentation, in addition to their advocating of sharing results with the greater scientific community, also contributed to the popularity and growing institutionalization of science in European society. Thus, the scientific method was a major break from ancient and medieval authorities that were still respected into the late medieval era.

The Dignity of Man— Renaissance Humanism, Secularism, Individualism

The Renaissance (rebirth), or rediscovery of the classics in Europe in the late thirteenth and early fourteenth centuries, led to considerable contemplation about the place of humanity in the world and the role it should play in the realization of the Christian divine plan. Rather than focusing on leading a fulfilling life on Earth for the purposes of satisfying requirements for the afterlife, humanism sought to encourage people to pursue fulfillment in this life for the purposes of realizing God’s divine plan here on Earth. Emerging from the prosperous city-states of Italy and progressing throughout the rest of Europe among elites, humanism inspired many

➤ GIOVANNI PICO DELLA MIRANDOLA, EXCERPT FROM *ORATION ON THE DIGNITY OF MAN*

Giovanni Pico della Mirandola (1463–1494) was an Italian humanist, significant for proposing to defend 900 theses on religion, philosophy, and magic for which he wrote the famous *Oration on the Dignity of Man* in 1486, a key text of Renaissance humanism, emphasizing the role of humanity in the progress of civilization.

“I have read in the records of the Arabians, reverend Fathers, that Abdala the Saracen, when questioned as to what on this stage of the world, as it were, could be seen most worthy of wonder, replied: ‘There is nothing to be seen more wonderful than man.’

In agreement with this opinion is the saying of Hermes Trismegistus: ‘A great miracle, Asclepius, is man.’ But when I weighed the reason for these maxims, the many grounds for the excellence of human nature reported by many men failed to satisfy me—that man is the intermediary between creatures, the intimate of the gods, the king of the lower beings, by the acuteness of his senses, by the discernment of his reason, and by the light of his intelligence the interpreter of nature, the interval

between fixed eternity and fleeting time, and (as the Persians say) the bond, nay, rather, the marriage song of the world, on David’s testimony but little lower than the angels. Admittedly great though these reasons be, they are not the principal grounds, that is, those which may rightfully claim for themselves the privilege of the highest admiration. For why should we not admire more the angels themselves and the blessed choirs of heaven? At last it seems to me I have come to understand why man is the most fortunate of creatures and consequently worthy of all admiration and what precisely is that rank which is his lot in the universal chain of Being—a rank to be envied not only by brutes but even by the stars and by minds beyond this world. It is a matter past faith and a wondrous one. Why should it not be? For it is on this very account that man is rightly called and judged a great miracle and a wonderful creature indeed.”

thinkers and scholars to ponder the significance of humanity’s place in the world, pursuing ends in this life and not in the next. Through involvement in the secular sphere of life—that is, through civic humanism—humanity could advance the interests of the state. Individuals could choose to edify themselves by studying the classics, acquiring the knowledge of the ancients through Byzantine and Islamic scholars, with the ultimate purpose of utilizing such knowledge to serve humanity and human progress. In this regard, humanism inspired the individual to seek involvement in the secular sphere and develop one’s human potential on an individual level in order to contribute to the development of humanity.

Renaissance Italian scholar Francesco Petrarca (1304–1374), or Petrarch, is recognized as the father of humanism for his idea that God had given humans their intellectual and creative potential to be utilized for the purpose of their human

development in this world. In *Secretum meum* he discusses how secular (worldly) achievements did not interfere with experiencing a viable relationship with God. As a devout Christian, Petrarch did not see a contradiction between having religious faith and developing the potential of humanity for secular ends. He recommended returning to classical learning, or *studia humanitatis*, particularly the study of grammar, rhetoric, poetry, history, and moral philosophy. In this regard he strongly advocated the study of ancient Greek

Francesco Petrarca, Italian Renaissance poet and humanist. (Library of Congress)

and Roman philosophers and statesmen in order to better understand the problems and moral questions of the past to guide one's conduct in the present and the future. He was also the first to recognize the Middle Ages as a distinct period in European history, seeing both Antiquity and his own time as different times of human enlightenment, divided by dark ages in the middle. By emphasizing the role of humanity in the world, he contributed to the advent of secularism.

Secularism, the pursuit of human development in the world rather than through the medieval emphasis on religious contemplation of the afterlife, was a significant element of Renaissance humanism. Leonardo Bruni of Arezzo (1370–1444) became an active defender of republican political values using the tenets of humanism to support his ideals, known as civic humanism. Studies of ancient statesmen such as Cicero inspired many, including Bruni, to recognize the similarities between their own republican forms of government and those of Antiquity. Upon this recognition Bruni, with verve and enthusiasm, became a vocal supporter of the Florentine republic. In his book *History of the Florentine People* he defended republicanism as the most efficient form of government, citing the ancient Romans as evidence. He further suggested that the destruction of republicanism by the Roman emperors led to the decay that resulted in the dark ages, creating a break in human progress that Florence was in the process of restoring. Thus, civic humanism took classical learning as a precedent to defend and improve existing political structures and to make the state a vehicle for human progress. The individual would have a significant impact in such an undertaking.

The internal and personal contemplation advocated by the humanists permitted the individual pursuit of self-improvement or enlightenment for the purposes of serving humanity later. Such thinking would lead critics of humanism, in the Church and in politics, to levy charges of self-involvement and un-Christian behavior on this element of this new intellectual movement. Humanists, such as Dutch theologian Desiderius Erasmus (1469–1536), countered that inner contemplation allowed individuals to make their own rational choices, rather than relying on

others for truth, regarding issues that concerned them. His critiques of the Church and its abuses and his recommendations for reform were an example of such a process.

The Evolution of Renaissance Classicism

The term “Renaissance classicism” refers to a fundamental attribute of the period that scholars refer to as the European Renaissance, roughly 1400–1600. Renaissance classicism was an intellectual movement that sought to mimic the literature, rhetoric, art, and philosophy of the ancient world, specifically ancient Rome. Scholars, politicians, and philosophers looked to ancient literary and artistic models for inspiration, and in turn this love of the classical world is termed classicism. The interest in the classical world was not new in the fifteenth century. In fact, there were powerful classicist themes in medieval Europe's scholarship, law, and art. However, when eighteenth- and nineteenth-century scholars sought to find the origins of their modern secular worldview, instead of pointing to the medieval classicists they pointed to the Italian (and other) classicists of the fifteenth and sixteenth centuries. Most notable among these modern scholars was the historian Jacob Burckhardt (1818–1897). Burckhardt claimed that the model of ancient Rome sparked a more secular individualistic society in Renaissance Italy. Burckhardt's rosy view of the Renaissance generally ignored the importance of religion, the horrors of incessant warfare, and the agonies of daily life during the period. Nevertheless, his

► ELEGANCES OF THE LATIN LANGUAGE

Lorenzo Valla's (1407–1457) *Elegances of the Latin Language* (1444) is a paean to the ancient Roman orators. In this section, Valla castigates the medieval period for what he believes to be a lack of learning and an ignorance of the classical world. However, his tone is positive, seeing the fifteenth century as a period of rebirth.

“Sorrow hinders and torments me, and forces me to weep as I contemplate the state which eloquence had once attained and the condition into which it has now fallen. For what lover of letters and the public good can restrain his tears when he sees eloquence now in that state in which it was so long ago when Rome was captured by the Gauls. . . . Students of philosophy have not possessed, nor do they possess, the works of the ancient philosophers; nor do rhetoricians have orators; nor lawyers the jurisconsults; nor teachers the known works of the ancients . . . those arts which are most closely related to the liberal arts, the arts of painting, sculpture, modeling, and architecture, had degenerated for so long and so greatly and had almost died with letters them-

selves, . . . [but] in this age they have been aroused and come to life again, so greatly increased is the number of good artists and men of letters who now flourish.

But truly, as wretched as were those former times in which no learned man was found, so much the more this our age should be congratulated, in which (if we exert ourselves a little more) I am confident that the language of Rome will shortly grow stronger than the city itself, and with it all disciplines will be restored. Therefore, because of my devotion to my native Rome and because of the importance of the matter, I shall arouse and call forth all men who are lovers of eloquence, as if from a watch tower, and give them, as they say, the signal for battle.”

research did point to the importance of classicism in the intellectual life of the Renaissance, a point on which later scholars elaborated.

The historical impetus for Renaissance classicism resulted from the political situation of medieval Italy. In medieval northern and central Italy, long-distance trade and the accompanying growth of cities led to the establishment of independent city-states as early as the twelfth and thirteenth centuries. Despite attempts by the papacy and various German rulers to assert their authority in northern and central Italy, these city-states were increasingly self-governing, involving many of the prominent citizens in civic affairs. Thus, knowledge of commercial transactions, the law, politics, and oratory became essential tools to the politically active citizen. Many families found that the emphasis on Aristotelian logic in the universities was too abstract and did not satisfy their need for a more practical education. In this context, an alternative approach to education developed: the *studia humanitatis*,

or humanistic studies. Humanist scholars taught the tools of grammar and rhetoric, important skills in argument that proved useful in the political context of the city-state. While not a philosophy per se, Renaissance humanism emphasized history and moral philosophy as guides to civic action and obligations. Assuming that medieval scholarship did not provide useful examples of rhetoric or moral philosophy, humanists turned to the classics. In Cicero, Quintilian, Sallust, and Livy, humanists found their rhetorical models, their historical examples, and their moral lessons.

With their interest in the classics and with their patrons' support, humanist scholars began foraging for classical examples. They searched for lost classical texts in the monasteries and archives throughout Europe. Likewise, they began to reread texts that had been widely available for centuries. Rejecting medieval scholastic techniques, which had emphasized logic and metaphysics in the reading of the classics, the

humanists approached the classics from a historical perspective and emphasized understanding them within their political and social contexts. They developed new methods of textual analysis and criticism known as philology. Philology had practical applications in Renaissance Italy, the most famous example being the Roman humanist Lorenzo Valla's (1407–1457) *Declamation on the Forged Donation of Constantine* (ca. 1440). Like other humanists, Valla recognized that classical texts were rife with errors: omissions, emendations, scribal errors, and even forgeries. Likewise, he noticed that language changed over time. The Latin of the first century BCE was significantly different from the Latin of the fourth century CE. Recognition of both of these philological premises was essential if humanists were to develop a truly classical rhetoric and grammar. However, in the political context of fifteenth-century Italy, philology had an even more significant application. With the patronage of King Alfonso of Naples, Valla applied his philological technique to a papal document titled the *Donation of Constantine*. Ostensibly, the *Donation of Constantine* was a fourth-century document in which the Roman emperor Constantine granted Pope Sylvester I political authority over Europe. With unrelenting accuracy, Valla dismantled it as a forgery by revealing anachronistic linguistic phrasings. Thus, historical criticism and philology became important elements in the humanistic education.

While Renaissance literary classicism emphasized Latin, interests extended to Greek scholarship as well. In part, this was because of the economic, religious, and political ties that western Europe had with Byzantium. The Mediterranean world fostered intellectual exchanges, which in the context of humanism encouraged some scholars to learn Greek. For example, as early as the late fourteenth century Manuel Chrysoloras, originally on a diplomatic mission from Constantinople, was teaching Greek and translating Greek texts in Italy. He became an instructor to early humanists such as Leonardo Bruni. The influence of Byzantine scholars on Renaissance classicism increased in the fifteenth century, culminating with the emigration caused by Sultan Mehmed II's capture of Constantinople in 1453. Particularly important to Renaissance classicism was the translation of the Platonic

corpus into Latin. The interest in Plato led to debates over these writings' correspondence with Christian doctrines, and writers such as Marsilio Ficino made Christian glosses on Plato's dialogues. Plato's writings led some to emphasize the *vita contemplativa* (the contemplative life) over the *vita activa* (the involved life), a transformation in humanism that happened against the political background of the rise of princes and the domination of ruling families such as the Sforzas of Milan (and elsewhere) and the Medici of Florence. In Florence, for example, the Platonic Academy, sponsored by Cosimo de' Medici and presided over by Ficino in the 1460s, emphasized metaphysics and mysticism over rhetoric, what is often termed Neoplatonism.

While Renaissance classicism was primarily a literary endeavor, it also transformed the visual arts. Renaissance scholars and artists increasingly turned to the ruins of the classical world around them for new artistic models. As scholars and princes collected classical manuscripts, they also collected coins and statues, which provided artists countless models on which to base their work. The ancient Roman models inspired new aesthetic conventions, which while present in twelfth- and thirteenth-century art came to dominate the styles of the Renaissance. Classical mythology became a prime subject matter for painting and sculpture. In the early fifteenth century Filippo Brunelleschi and Donatello traveled to Rome to draw and measure the ancient ruins. Brunelleschi's studies resulted in architectural works that diverged from the medieval Gothic and integrated elements from classical architecture. Donatello imbibed the models of classical statuary, in particular the style of *contrapposto* in which the figure is presented asymmetrically, resting the weight of the body toward one foot that is turned away from the front, in order to give the statue a semblance of vitality and motion. By the 1430s the humanist Leon Battista Alberti began writing a series of three theoretical works on art. Using classical sources as inspiration, he provided one of the first outlines of Renaissance artistic classicism. At the turn of the sixteenth century, the masters Michelangelo Buonarroti, Raphael, and Leonardo da Vinci became the exemplars of High Renaissance classicism.

By the mid-fifteenth century, classicism was a powerful educational and aesthetic force in Italy. And in the international context of Renaissance Europe, countries throughout Europe came under its influence. Humanists in universities or acting as private tutors trained a generation of nobles to appreciate the artistic, literary, and philosophical works of the classical world. The humanists' success in analyzing the classics led to a broadening of their philological techniques to scripture, the law, and even natural philosophy. By the end of the sixteenth century the effects of Renaissance classicism were found in nearly every facet of European elite culture.

Europe's Age of Reason

Historians have conventionally used the term “Age of Reason” to describe a philosophical revolution that took place in Europe from the seventeenth through the eighteenth centuries.

Such intellectual movements are highly complex, however, and we should be careful in assigning terms such as “Age of Reason” or “The

Enlightenment” to historical periods. Regardless, the terms continue to be used, especially in Western civilization survey textbooks, and according to this vision of European history, during the “Age of Reason” prominent thinkers rejected traditional medieval understanding of philosophy, government, religion, and the natural world, offering instead radical ways of thinking that initiated a great debate between reason and faith.

In fact, the Age of Reason did not emerge in a vacuum. Late medieval thought, ironically, in light of the criticism of later rationalists, provided the framework for the emergence and development of movements that were foundational to the Age of Reason. The intellectual advances of the Scientific Revolution and the social and theological challenges of the Protestant Reformation found their ideological underpinnings in the later Middle Ages. From the

Title page of the 1651 edition of Thomas Hobbes' *Leviathan*. (Library of Congress)

late 1200s some European scientists began to emphasize evidence that could be observed and measured through new scientific methods, and some went so far as to question the theories of Aristotle, thereby laying a foundation for later scientific breakthroughs. Later, during the sixteenth-century Protestant Reformation, Christian thinkers such as Martin Luther and John Calvin followed in the footsteps of late medieval predecessors such as John Wycliff, John Huss, or even the larger Hussite movement in rejecting the dominant teachings of the Roman Catholic Church. They instead argued for the centrality of the Bible in the Christian faith over popes, ecclesiastical councils, and sacred tradition. Although Protestants never viewed reason, at least as envisioned by rationalists in the later Age of Reason, as superior to faith, their rejection of tradition and the authority of the Church provided an important precedent for which later thinkers could do the same, even if for vastly different reasons.

Like the Scientific Revolution and the Protestant Reformation, the Age of Reason represented a rejection of tradition. While earlier medieval thinkers such as Thomas Aquinas and the Scholastics who preceded and followed him worked to establish the continued relevance of ancient and medieval authorities, early modern thinkers such as Francis Bacon, René Descartes, and Immanuel Kant saw little relevance for the dominance of the past over their modern age. They instead sought to examine old and new evidence with fresh tools and insights, applying reason and experience, rather than faith or tradition, as the lenses through which such evidence would be evaluated. This new way of viewing things also influenced how they understood the world. Many abandoned traditional and often hostile European stereotypes of foreign peoples and showed a greater appreciation for non-western cultures. For example, the French satirist Voltaire, in his most popular work, *Candide*, depicts the main characters fleeing from the troubles of Europe only to find peace in Istanbul. In a similar way Montesquieu satirized French society by viewing it through Persian eyes in his *Persian Letters* of 1711–1720.

Few names have been as associated with the Age of Reason as that of French philosopher René Descartes (1596–1650). Descartes has been

considered the founder of modern philosophy and has also been hailed for his work in mathematics and science. He explicitly rejected past knowledge as a basis for knowing anything and, as a result, accepted nothing as certain until it could be reconciled with critical reasoning. His appeal to reason ranked him firmly among the rationalists of his day, including such thinkers as Baruch Spinoza and Gottfried Leibniz. The rationalist school of thought, in its broadest definition, appealed to reason as the chief source of knowledge. The rationalists were challenged by the empiricist school of thought, which included thinkers such as Thomas Hobbes and John Locke. Empiricists emphasized the role of experience and experiment in the formulation of ideas. From their theory of knowledge emerged the modern notion that all scientific hypotheses must be based on observations of nature rather than on revelation or a priori reasoning. Although the two philosophical systems sometimes clashed, both the rationalists and the empiricists rejected traditional beliefs as had been passed down though the Middle Ages and sought to understand the world through their new philosophies.

The Age of Reason also witnessed the emergence of novel political thought based on these innovative philosophies. In 1651 English philosopher Thomas Hobbes published *Leviathan*, a work that would become a foundation for modern Western political philosophy. In *Leviathan*, Hobbes asserted that a social contract exists between monarchs and the people they rule in which mutual self-interests preserve peace and order. Although Hobbes admitted that a social contract could become void when government failed in its responsibilities to its subjects, he otherwise denied the right to rebel against a legitimate social contract. In 1689 John Locke heavily modified Hobbes's social contract in his influential study *Two Treatises on Government*. Locke wrote this work in defense of England's Glorious Revolution (1688–1689) and argued that a government was only legitimate if it protected the natural rights of its citizens and ruled with their consent. Without such consent, argued Locke, citizens had a right to rebel against their government. Locke's views influenced later thinkers, including the Genevan philosopher Jean-Jacques

► RENÉ DESCARTES ON THE REJECTION OF TRADITION

The following selection from the opening paragraph of Descartes's first book of *Meditations* briefly describes the philosopher's earlier epiphany that many of the traditional beliefs he had once accepted were instead false. This realization inspired him to abandon all his previous opinions, which had been based on the wisdom of the past, and to embark on a new search for truth in his modern age.

"Several years have now elapsed since I first became aware that I had accepted, even from my youth, many false opinions for true, and that consequently what I afterward based on such principles was highly doubtful; and from that time I was convinced of the necessity of undertaking once in my life to rid myself of all the opinions I had adopted, and of commencing anew the work of building from the foundation, if I desired to establish a firm and abiding superstructure in the sciences. But as this enterprise appeared to me to be

one of great magnitude, I waited until I had attained an age so mature as to leave me no hope that at any stage of life more advanced I should be better able to execute my design. On this account, I have delayed so long that I should henceforth consider I was doing wrong were I still to consume in deliberation any of the time that now remains for action. To-day, then, since I have opportunely freed my mind from all cares [and am happily disturbed by no passions], and since I am in the secure possession of leisure in a peaceable retirement, I will at length apply myself earnestly and freely to the general overthrow of all my former opinions."

—Andrew Holt

Rousseau. In his 1762 work *The Social Contract*, Rousseau expanded on Locke's work to argue for the supremacy of the general will of the people, and his arguments were influential before and during the French Revolution.

The Enlightenment of the eighteenth century was also a product and continuation of the Age of Reason. Just as the important thinkers during the early stages of the Age of Reason had rejected received knowledge and abandoned traditional forms of government and religion, so did Enlightenment-era thinkers such as Voltaire, Denis Diderot, and Thomas Paine. Perhaps the most well-known Enlightenment thinker was Voltaire, who rejected his Catholic faith in favor of a deism based on reason that allowed for religious freedom. Few critics of the Church were as effective as Voltaire, who unleashed his well-known satiric wit against traditional Christian dogmas and practices in a number of popular publications in the mid-eighteenth century. Like Voltaire, the French philosopher Diderot also promoted the Age of Reason in his written works, most notably through his monumental *Encyclopédie, ou dictionnaire raisonné des*

sciences, des arts et des métiers (Encyclopedia, or A Systematic Dictionary of the Sciences, Arts, and Crafts). Diderot declared that his goal was to change the way people thought about a wide range of issues covered in the nearly 72,000 articles in his encyclopedia, published in France between 1751 and 1780. He was successful, as his work is generally credited with having contributed to the intellectual and philosophical thinking that was foundational to the French Revolution. Like Voltaire and Diderot, the British-born Enlightenment thinker and American founding father Thomas Paine also argued for the superiority of reason over traditional beliefs in both his popular work *Common Sense* and his later controversial work, *The Age of Reason*. In *Common Sense*, published during the American Revolution in 1776, Paine denounced British rule, and his work became enormously popular with American Revolutionaries whose hard-fought independence from Great Britain led to the establishment of the earliest form of modern democracy in the West. Although Paine won considerable praise for *Common Sense*, his later work, *The Age of Reason*, brought him

an equal level of notoriety from the time of its publication in the early 1790s until his death in 1809. This was because *The Age of Reason* was a philosophical work highly critical of the Bible and considered deeply offensive by many Christian believers. Yet *The Age of Reason* was, and has remained, popular in rationalist circles from the time of its writing until the present day.

Peace of Prague

Events leading to the Peace of Prague (May 30, 1635) began in 1630, when Sweden entered the Thirty Years' War on the side of German Protestants. Swedish troops or their proxies experienced considerable success against Catholic forces and restored several lands to Protestant control. Yet German Catholics, under the leadership of the Habsburg Holy Roman emperor Ferdinand II, rebounded in September 1634 with an important victory at the First Battle of Nördlingen. It was only after the events at Nördlingen that both sides began serious considerations for peace. The time was right, as by then the Swedes were looking for ways to get out of the war, and their German allies were increasingly suspicious of the Swedish commitment to the war and wanted to preserve gains from earlier victories. Catholics were inclined toward peace for two reasons. First, they temporarily had a stronger hand to play in any peace negotiations because of their recent victories (especially at Nördlingen). Second, many Catholics feared the long-term results of the war, as German Protestants had a seemingly inexhaustible supply of international support due to fears of Habsburg supremacy by both Catholic and Protestant powers.

The most notable leader of the German Protestants seeking peace was John George I (1611–1656), the duke elector of Saxony. In fact, only ten weeks after the Protestant defeat at Nördlingen, peace negotiations were begun between the electorate of Saxony (joined by the landgraviate of Hesse-Darmstadt) and imperial representatives of Ferdinand II that provided a foundation for the later Peace of Prague. Although negotiations began at Leitmeritz, in the summer of 1634 they were moved to Pirna, where they produced a preliminary agreement, the so-called Preliminaries of Pirna (or Pirna Points).

The primary goals of the negotiators were to eliminate all foreign presence in Germany and to settle the internal problems of the empire. To achieve this, compromise was needed, and both sides were willing. Perhaps the most important concession was the suspension of the Edict of Restitution for 40 years (a virtual revocation of the edict), which signaled the abandonment of militant efforts to restore Catholicism in Germany. In addition to special concessions for John George, the Pirna Points also included amnesty and restitution of property for all those who had taken up arms against the empire after 1630 as well as provisions for a unified imperial army to enforce the peace against those who opposed it (Germans and foreigners alike).

Once the negotiators had drafted the articles of the Pirna Points, it was left to Ferdinand II to decide if he would accept them. The emperor and his advisers began extensive deliberations on the articles before deciding to seek additional advice. Ferdinand II then convened a panel of 23 theologians to study the agreement and offer theological commentary on its acceptability. The group met on February 5, 1635, and included members of 8 different religious orders and 2 secular priests. The conference ended on February 16, and although 7 Catholic militants rejected any peace with the Protestants, the remaining participants favored the proposed treaty. Ferdinand II agreed with the majority, and the peace was formally implemented in Prague on May 30, 1635.

Although the Peace of Prague successfully ended the Swedish period of the Thirty Years' War, it failed to achieve a lasting peace. France, concerned about the strength of the Habsburg

➤ VALERIAN MAGNI ON THE PEACE OF PRAGUE

An important voice in the deliberations of the Peace of Prague was the Capuchin friar Valerian Magni (1586–1661). As a confidant of Pope Urban VIII (r. 1623–1644) and an adviser to Holy Roman Emperor Ferdinand II (r. 1619–1637), Magni was a logical choice for inclusion as one of 23 theologians invited to offer advice to the emperor on the acceptability of the so-called Pirna Points. In the following text Magni expresses his approval of the provisions of the Peace of Prague and argues that the emperor can accept them in good conscience. Specifically, Magni cites the example of St. Athanasius of Alexandria and his dealings with the Arians during the fourth century as a precedent for a provision of the Peace of Prague that called for Catholics to cede control of some churches to Protestants.

“Can it be in the present articles [Pirna Points], that peace with the Duke Elector of Saxony and the Catholic religion . . . preserves some internal evil? Is the Emperor able to concede [to the agreement] without sin and offense to God? . . .

I respond . . . the article presented to me with the Duke Elector of Saxony, and the Catholic

religion . . . sustains no internal evil, with respect for the sake of gaining good, and avoiding great evil . . . the Holy Emperor can ratify it with praise and merit from God. . . .

St. Athanasius . . . understood that he would have to give over the Church of Alexandria to the Arians . . . in order to take back another church from the same heretics of Antioch. . . . From such an example, however, one may infer; it is much more permitted to begin the act of settling the state [making peace] in the highest necessity to restore to the heretics one hundred churches, which are not to be defended without the danger of losing all that remains; when he [the emperor] receives from the heretics many thousands of churches.”

Valerian Magni, “Letter of Valerianus Magni to Cardinal Dietrichstein. Feb. 19, 1635,” translated by Andrew Holt, in *Osterreichisches Staatsarchiv, Haus-, Hof-, und Staatsarchiv* (Vienna), Reichshofkanzlei, Friedensakten, 11a, pp. 277–288.

position resulting from the peace, launched the last period of the Thirty Years’ War. Even so, the Peace of Prague represented a significant turning point in the Thirty Years’ War, if not the future of Europe, in four important ways. First, while the Peace of Prague did not end the war, it set an important precedent for the later Peace of Westphalia in 1648 in that it recognized Protestant authority in areas of Germany. Second, the Peace of Prague also reflected the growing awareness of the Catholic leadership that winning the complete restoration of Catholic lands might not be possible. Third, the Peace of Prague marked the death of the crusading spirit in Europe, which had been reinvigorated in the early stages of the war when it was understood as a religious conflict between Protestant and Catholics. The Peace of Prague forced Catholics to renounce crusading against Protestants and the entrance of Catholic France into the

war on the side of the Protestants (against other Catholics) and put an end to any notion that the Thirty Years’ War was a matter of faith. Finally, the Peace of Prague also reflected a decline in the authority of the papacy, as the pope was not consulted during the deliberations and drafting of the agreement.

The Age of Discovery

The Age of Discovery, a problematic label for the initial period of cultural contact and exchange between Europeans and other world regions between 1400 and 1700, is characterized by a vast shift in early modern European worldviews and conceptualizations of their place in the world. While other world regions, such as China and India, had embarked on transoceanic voyages of discovery and developed commercial networks in previous centuries, the initial contact between Europe and the New World and much of the Old World had significant consequences for subsequent centuries in terms of the balance of global economic and political power. As early modern Europeans set forth on transoceanic travels in the Atlantic and Indian oceans, created global trade networks, and toppled civilizations, many of them began to conceive of themselves as the beacon of Christian civilization and as being superior to the cultures they vanquished and conquered. The rosy picture conceived by the notion of an Age of Discovery as a time when Europe began its formal debut on the world's stage to shed light on a dark world vastly contrasts with the rampant disease, decimation of indigenous peoples, and economic and political dislocations suffered due to the subsequent development of the Atlantic slave trade and imperialism.

The fall of Constantinople in 1453 marked the ascendancy of the Ottoman Empire in the Mediterranean region, much to the dismay of various European merchant states in Iberia and Italy. Italian city-states such as Venice and Genoa continued to ply their trades through Ottoman middlemen, but this inflated the prices of much-coveted spices from India, China, and Southeast Asia, wanted in much of western Europe. Iberian merchants in both the Spanish kingdoms and the Portuguese realms sought to capitalize on this situation by seeking to explore direct routes to the Far East and circumvent these Ottoman and Safavid middlemen.

The initial voyages of exploration and discovery began in earnest first in Portugal and then in Spain in the fifteenth and sixteenth centuries, given their geographic proximity to direct ocean currents and technological exchanges

with North African Muslim traders. Contact with the Muslim sultanates in North Africa exposed Iberian merchant seamen to new naval technologies, which they incorporated into their new oceangoing vessels, such as the caravel. Furthermore, the proximity of the Iberian peninsula to Atlantic currents, which allowed direct southerly and westerly travel both down the coast of Africa and toward the New World in the Americas, allowed explorers such as Vasco da Gama and Christopher Columbus to discover lands unknown to Europeans. While they were aware that India existed, these explorers merely searched for a direct route to get there. The Portuguese sought to find the direct source of gold in West Africa to circumvent Muslim traders, but they also discovered the source of the existing slave trade along the Bight of Benin and the Bight of Biafra. Portuguese explorers also found a tenable route to South Asia and the East Indies, putting them in direct contact with the Indian Ocean and Far East trade networks already in existence for centuries. The Spanish, building on Portuguese achievements, went west into the Atlantic also seeking to find the Indies (Japan in Columbus's case) and accidentally (or serendipitously) made contact with the Americas. This brought them into cultural contact with indigenous American people, whom they viewed as heathens because they were not Christian. Both the Spanish and the Portuguese, with preconceived notions of non-Christians in Iberia (mostly Jews and Muslims), brought these values with them to these uncharted regions, which influenced their perceptions of "the other." Disease and violence would soon follow. English explorers such as John Cabot, who happened upon Newfoundland while seeking a northwest passage to the East, discovered the enormous resources available in the vast stretches of North America. In the seventeenth and eighteenth centuries, English, Dutch, and French exploration of the new worlds (i.e., the Americas, Oceania, and South Asia) were a result of intra-European competition for resources (particularly treasure ships coming from New Spain) and an increasing awareness of a larger world open to trade. English and French intrusions into the Americas resulted in the establishment of colonies and trading posts for the purposes of cultivating

► BATTLE OF LEPANTO, 1571

The Battle of Lepanto of 1571 was a turning point in world history as the moment when a coalition of European naval forces defeated the Ottoman fleet off the coast of western Greece, inadvertently cutting them off from the Atlantic and ensuring European dominance of the Atlantic world. Even after the initial period of the Age of Discovery, Europe was still not on par with the economically flourishing Ottoman Empire, which continued to consolidate its territories, exploited its access to the trade routes of central Asia, and threatened Christendom along the Danube. On October 7, 1571, the combined fleets of Habsburg Spain, Venice, Genoa, and the Papal States (the Holy League) engaged the Ottoman fleet, ultimately defeating it. The battle asserted the Holy League's control over most of the Mediterranean and prevented the Ottomans from advancing into Europe. Furthermore, while it did not ensure Christian Europe's naval supremacy over the Ottoman Empire (which would not occur for several decades), it did ensure that the Ottomans were effectively blocked from the western Mediterranean and the Strait of Gibraltar. As a result, the Ottomans were essentially unable to engage in transoceanic Atlantic commerce; however,

Painting of the Battle of Lepanto between the Ottoman Empire and an alliance of European states, artist unknown. The battle, which took place on October 7, 1571, was the largest naval engagement in early modern times and the last great naval battle fought by traditional oar-powered galleys. (Jupiterimages/National Maritime Museum, London)

they continued to trade lucratively due to their access to overland Asian commercial networks and sea trade along the Red Sea, Persian Gulf, and Indian Ocean networks. The Ottoman Empire was still a formidable foe for Christian Europe well into the 1800s.

—Abraham O. Mendoza

immense quantities of cash crops (i.e., sugar, tobacco, indigo) and the fur trade with indigenous peoples. The Dutch sought to supplant the Portuguese in Brazil, Africa, South Asia, and the East Indies, thereby succeeding at creating a commercial empire in the latter two, with the English and French also seeking a piece of the pie amid the declining Mughal Empire.

The Age of Discovery also ignited intellectual and scientific paradigm shifts within Europe, given that older explanations and worldviews did not account for recent discoveries. Ancient Aristotelian and Ptolemaic frameworks of the globe and the universe, used through the Middle Ages, were supplanted by more accurate geographical and astronomical explanations. New conceptualizations of the universe and scientific epistemologies, driven by the scientific method and European intellectuals such as Francis Bacon, René Descartes, Galileo Galilei, and

Isaac Newton, drastically altered the existing European worldviews inherited since Antiquity.

Jewish Mysticism

Jewish mysticism, also referred to as Kabbalah in Hebrew, is an umbrella term referring to a wide range of philosophies and practices within Judaism concerning the nature of God, the interpretation of the Holy Scriptures, and the consequences of human action on the divine. The shared features of various Jewish mystic writings

ISAAC LURIA

Isaac Luria (1534–1572), known also as the “Holy ARI” (an acronym of his name but also meaning “lion” in Hebrew), is one of the most prominent figures in Jewish mysticism. Born in Jerusalem to a family of German origin, he was orphaned at a young age and was raised in his uncle’s house in Egypt. Here Luria acquired knowledge in formal rabbinic literature and began to show interest in mysticism. He also became a merchant, a practice that apparently continued to provide for him until his untimely death.

Luria published one book, a commentary on one of the chapters of the *Zohar*. Deeply influenced by the ideas of his teacher, Moses Cordovero, this text did not display the unique traits of Luria’s own thinking. Luria’s teachings were recorded by his disciples and followers, mostly

after his death, and this is probably the cause for some of the contradictions in his teachings.

According to Luria, the Sefirot are dynamic vessels (Kelim), which at the time of creation could not bear the light of the Eternal (Ein Sof) and burst (except for the three top ones, which were closer to the Ein Sof). The purpose of humanity is to be righteous in order to fix the vessels by their actions. When the vessels are completely fixed, the Messiah will come.

Luria’s introduction of a Messianic idea is one of his formative contributions to Jewish mysticism. It is said to be one of the foundations for such messianic movements as the Sabbatean movement of Shabbatai Zvi in the seventeenth century.

—Aryeh Amihay

can be said to focus on spirituality; the claim of access to esoteric, or hidden, knowledge; and a special interest in the supernatural, sometimes by means of magic. Throughout history, Jewish mysticism has played the role of an alternative, perhaps even subversive, philosophy to the main currents of Judaism. Although it has never received an authoritative status in Judaism and is sometimes even prohibited by rabbis, it remains a source of interest to Jews to this day.

The origins of Jewish mysticism are hard to trace. Some evidence of interest in mysticism can be found in certain later parts of the Tanakh (Jewish Bible) or in such nonbiblical works as the *Book of Enoch* (160s BCE), but none of these testifies to an established philosophical system as we find later on. The earliest book that can be defined as presenting a comprehensive mystical work is the *Book of Creation* (*Sefer Yetzirah*). Its date is greatly disputed, although most scholars have until recently regarded it to be no earlier than the second century CE and no later than the sixth century. In recent years this has been contested, with an increasing number of scholars ascribing it as early as the first century BCE.

The defining work for Jewish mysticism is the *Zohar* (*The Glow* or *The Brightness*), a composition written mainly in archaic Aramaic. It originally was a mystical commentary on the

Torah (Law), the first five books of the Bible that are also known as the Pentateuch. Later on appendices were added, such as a commentary on the *Book of Canticles* or a description of the meeting of the rabbis who wrote the *Zohar*. The *Zohar* claims to be written by rabbis from the time of the Talmud, in the first centuries CE, but this has been found to be untrue. It was published in the thirteenth century by a Cabbalist (a person who has knowledge in the Kabbalah) named Moses de Leon, who lived in Spain. Although de Leon claimed that he was copying it from ancient manuscripts, he was unable to show these manuscripts when asked to do so by Isaac from Acre, who traveled from Palestine to Spain to learn about the origins of the *Zohar*. Furthermore, we know that after de Leon’s death a rich man was willing to marry his son to de Leon’s daughter on the condition that he would receive the ancient manuscripts. De Leon’s widow and daughter claimed that such manuscripts never existed and that de Leon wrote it on his own accord. Aside from these anecdotes, scholars have also managed to establish a connection between de Leon and the *Zohar* on philological grounds. Many ideas that appear in the *Zohar* appear also in de Leon’s sermons, which he claims, strangely enough, to be new and original. These are probably sermons written before

he came to realize that he would have to ascribe his writings to some ancient figure in order to present his ideas to a wider audience.

After the expulsion of the Jews from Spain in 1492, the city of Safed in present-day northern Israel became a prominent center for Cabbalists for more than 100 years. The trauma of the expulsion led to a deep religious crisis, manifested in the fact that many Jews believed that such a terrible tragedy could only be a sign that Salvation was near. This helped Kabbalah rise to the surface and gain a wider audience and a more public platform than it had beforehand. Despite the fact that it continued to bear an esoteric character, more people were interested in practicing it, believing that they could bring redemption earlier.

Of the many Cabbalists who lived and taught in Safed at the time, we know of two major figures. One was Moses Cordevero (1522–1570), who had a major impact on the study of Kabbalah. Cordovero wrote a significant commentary on the *Zohar* titled “Pardes Rimonim” (Orchard of Pomegranates). The other major Cabbalist of the time was Rabbi Isaac Luria. Luria developed a specific form of mysticism based on the *Zohar* and other mystical traditions but at the same time introducing and formulating key terms that eventually became an essential part of Jewish mysticism and constituting what is known today as Lurianic Kabbalah.

The main enterprise of Jewish mysticism is to describe God, both in His physical appearance and His nature. This is one of the main aspects of Kabbalah that can be said to bear some affinity to the rationalist streams of Jewish philosophy. Although the solutions provided by Cabbalists and philosophers are quite different, they address similar issues.

One of the main problems confronted by Cabbalists is how God acts in the world. The premise is that God is metaphysical, that is to say, He is above nature, detached from nature, and therefore cannot be part of the earthly world. At the same time, everything in this world is supposed to be monitored and an expression of His will. The solution offered by Jewish mysticism to solve this contradiction is the system of the Sefirot (Enumerations). According to this theory, God is expressed by a complex

system. On the one end is the Ein Sof (Eternity, literally “Endless”), which represents the metaphysical aspect of God; it is all-encompassing and incomprehensible and is not directly related to the earthly world. The Ein Sof is connected to the head of the Sefirot, the system through which God connects to the world. The Sefirot include ten facets, of which the top one is connected to the Ein Sof and the bottom one is connected to the earthly world. The names of the Sefirot are Keter (crown), Bina (intelligence), Chochma (wisdom), Daat (knowledge), Gevura (power), Chesed (grace), Tiferet (splendor), Hod (majesty), Netzach (eternity), Yesod (foundation), and Malchut (kingship). The Sefirot also symbolize various aspects of God, serving to depict the contrasting attributes of His nature. Thus, for example, intelligence and wisdom represent two forms of His intellectual capacities, and power and grace reflect the two measures of His judgment, whether the sternness of a judge (power) or His leniency (grace). The Sefirot also symbolize the body organs: the crown is the head, the power and grace are the hands, and so forth. Each one of the Sefirot is connected with at least one biblical figure who was supposedly the epitome of this trait.

Other symbolic references include the use of letters of the Hebrew alphabet, which are supposed to belong to different Sefirot, and the use of numerology. The Sefirot are only one example of the heavy use of symbolism in Jewish mysticism. Many of the statements in mystic writings are cryptic, adorning them with an esoteric air. The system of the Sefirot was used to demonstrate how God invests the world with His goodness. At the same time, the system was described as a two-way street: each human action affects the Sefirot, stressing the importance of observing Jewish law.

The Rise of the Dalai Lamas in Tibet

Since the time of the Fifth Dalai Lama, Ngawang Lobsang Gyatso (1617–1682), until the Chinese occupation of Tibet in the 1950s, the Dalai Lamas have been the spiritual and temporal leaders of the Tibetan people and the Tibetan nation. The institution of the Dalai Lamas in Tibet derives from a religious view held by Tibetan Buddhists by which it is believed that great spiritual masters, Buddhas and bodhisattvas, willfully choose to take repeated rebirths in the world in order to teach and be of benefit to living beings who are progressing on the path to Buddhahood. Thus, when a Dalai Lama dies, the greatest masters of his tradition of Buddhism are entrusted with the responsibility of finding his next reincarnation. Although there are probably more than 100 such recognized lines of reincarnate lamas (or *tulkus* as they are called in Tibetan) today, the line of the Dalai Lamas is considered to be the most important and most revered and has certainly been the most well known outside of Tibet.

The person formally identified today as the First Dalai Lama was Gendun Drub (1391–1475), a renowned scholar, meditation master, and direct disciple of Tsongkhapa, the founder of the tradition that has come to be known as the Geluk denomination of Tibetan Buddhism. Although the Dalai Lamas are officially Geluk *tulkus* due to this connection with Tsongkhapa and the founding of the Geluk tradition, many of the Dalai Lamas, including the current Dalai Lama, Tenzin Gyatso, practice in all four of the Tibetan Buddhist denominations.

Dalai Lama I, Gendun Drub, was widely regarded as one of the most powerful Buddhist teachers in Tibet during his time. He had thousands of disciples, including royalty, and traveled widely. As a result of his broad travels and popularity as a religious teacher, he was a major reason for the early spread of the Geluk

denomination in Tibet. Gendun Drub is probably most famous for two key accomplishments: the writing of profound philosophical treatises and the founding of the Tashi Lhunpo monastery. Tashi Lhunpo is one of the most important monasteries in the Geluk tradition, and for many centuries now it has been the seat of the Panchen Lamas, the second most powerful tulku line in the Geluk tradition.

Although there was initially no search for Gendun Drub's reincarnation because it was not yet the tradition to do so, numerous mystical signs, including proclamations by Gendun Gyatso (1475–1542) himself, indicated that he was in fact the reincarnation of Gendun Drub. When Gendun Gyatso made a visit to Tashi Lhunpo, he is said to have recognized many of his closest disciples from his previous life, calling them by name and relating stories about their earlier encounters together during the life of Gendun Drub. This convinced all concerned that Gendun Gyatso was the reincarnation of Gendun Drub.

It was not until the time of Gendun Gyatso's successor, Sonam Gyatso (1543–1588), that the title "Dalai Lama" was given to this line of reincarnate masters. Mongolia was a superpower in central Asia at the time, and Sonam Gyatso was invited to be the spiritual teacher of the Mongol court. There had been a long-standing spiritual friendship between the Mongols and the Tibetans, although this was the first encounter between the Mongols and the Geluk tradition. Altan Khan, chief of the Tumed Mongols and a descendent of the royal line of Chinggis Khan and Kublai Khan, took on Sonam Gyatso as his guru, and it was Altan Khan who gave him the title "Dalai Lama." "Dalai" is a Mongolian word meaning "ocean." "Lama" is the Tibetan word for the Sanskrit "guru," or spiritual teacher. The connotation was that Sonam Gyatso was the spiritual teacher whose wisdom was as vast as the ocean and thus was the Dalai Lama. Gendun Drub and Gendun Gyatso were retroactively called the First and Second Dalai Lamas, and Sonam Gyatso was considered the Third Dalai Lama. Sonam Gyatso had a powerful influence on Altan Khan and the Mongols, virtually converting Mongolia to the Geluk form of Tibetan Buddhism. The

relationship between the khans and the high Geluk lamas was cemented when Altan Khan's great-grandson was recognized as the Fourth Dalai Lama, Yonten Gyatso (1589–1616).

The next Dalai Lama, Ngawang Lobsang Gyatso (1617–1682), often referred to by Tibetans as the “Great Fifth,” was the first of the Dalai Lamas to assume the role of temporal as well as spiritual leader of Tibet. Tibet was not a unified country in the early seventeenth century. There was an ongoing conflict in what is now the central Tibetan province of Tsang where the king of Tsang, who was sympathetic to the rival Kagyu denominations of Tibetan Buddhism, was persecuting the Gelukpas. In the name of protecting the Geluk school, the Mongol army under the leadership of Gushri Khan came into Tsang. The king of Tsang could not resist, and ultimately the kingdom fell. Similar events took place in other ethnically Tibetan areas such as Ladakh. The Fifth Dalai Lama became a quasi God-king in this new theocracy, as he unified ethnic Tibetan areas under a central and consolidated government in Lhasa for which he was the head. Subsequent Dalai Lamas were to be the future rulers of Tibet, with a panel of four regents in control during the periods between the death of one Dalai Lama and the coming of age of the next.

Several of the next seven Dalai Lamas lived relatively short lives and did not greatly impact the nation or the institution of Dalai Lamas. The Thirteenth Dalai Lama, Thubten Gyatso (1876–1933), was the first to attempt to modernize Tibet. He predicted future troubles with China, and some Tibetans believe that he even consciously chose to die prematurely so that he would be of age in his next life when the Tibetans would be relying on his ability to lead them in their struggles against an occupying Chinese government.

According to many Tibetans, the Fourteenth Dalai Lama, Tenzin Gyatso (1935–present), is the greatest of all. With Tibet under heavy-handed occupation by the Chinese government since the 1950s, Tenzin Gyatso established a Tibetan government-in-exile in Dharamsala, India, and has been the unifying voice that has kept Tibetan culture and their hopes for regaining their nation alive. In 1989 he was awarded the Nobel Peace Prize for his long-standing commitment to

THE GELUK SCHOOL

The Geluk school is a denomination of Tibetan Buddhism that follows the traditions of philosophical thought and forms of meditation practice established by the towering Tibetan master Tsongkhapa Lobsang Drakpa (1357–1419). Tsongkhapa was a reformer who emphasized pure ethics, monasticism, rigorous philosophical study, a commitment to daily meditation, and regular periods of extended retreat. His approach to the Buddhist path, which serves as the fundamental structure for spiritual training in the Geluk tradition, is presented in its quintessential form in his famous treatise *The Great Treatise on the Stages of the Path to Enlightenment*. In this work, Tsongkhapa outlines a gradual path to Enlightenment, one that is inclusive of the entire spectrum of Indian Buddhist teachings and presented in progressive stages. He organized the vast body of teachings in such a way as to show how elements from the wide variety of Buddhist teachings work together and build upon one another, like stepping stones on a path, to help to create enlightened beings, or Buddhas. The Dalai Lamas are the most famous followers of the Geluk tradition, and it currently stands as the largest denomination of Tibetan Buddhism.

The Rise of Sikh Belief and Community

Sikh belief has its origins in both Hinduism and Islam. Hinduism by 1500 CE had become a conglomerate that included both ancient Vedic rituals and emotional bhakti (devotional) cults, cults that combined abstract meditation and popular worship of the divine through manmade images or natural objects such as trees, animals, and rivers. Sikhism emerged from bhakti cults of northern India. On the other hand Islam, especially the Sufi tradition, also helped to inform belief. The founder of the belief became known as Guru Nanak.

THE JAPJI

The Japji is the morning prayer of Guru Nanak, supposedly recited by Sikhs each morning. Here is the first half:

“There is but one God whose name is true, the Creator, devoid of fear and enmity, immortal, unborn, self-existent.

The True One was in the beginning; the True One was in the primal age.

The True One is now also, O Nanak; the True One also shall be.

By thinking I cannot obtain a conception of Him, even though I think hundreds of thousands of times.

Even though I be silent and keep my attention firmly fixed on Him, I cannot preserve silence.

The hunger of the hungry for God subsideth not though they obtain the load of the worlds.

If man should have thousands and hundreds of thousands of devices, even one would not assist him in obtaining God.

How shall man become true before God? How shall the veil of falsehood be rent?

By walking, O Nanak, according to the will of the Commander as preordained.”

—Edwin Hirschmann

Source

Selwyn Gurney Champion and Dorothy Short, *The World's Great Religions: An Anthology of Sacred Texts* (New York: Dover, 2003), 301.

Nanak was born into a middle-class family in the turbulent Punjab region of northwestern India in 1469. He was a bright and inquisitive boy, but he was less interested in formal schooling or worldly matters. Instead, he pondered, wandered, and listened to the songs of minstrels and fakirs; he was attracted to the preaching and poetry of Kabir (ca. 1425–1505), a Banaras (Varanasi) weaver who declared that God is not to be found exclusively in the Vedas or the mosques but everywhere. Nanak began the habit of predawn bathing, and on one such occasion he received what he felt was divine revelation. It is said that he disappeared for three days and then returned and began to preach, discuss, instruct, and tour. He traveled around India and reportedly also visited Mecca and Medina.

When Nanak settled down, it was in Kartarpur, a village in the Jullundur sector of eastern Punjab. There his preaching and ministering attracted admiring crowds, who formed a loose-knit community called the *panth*.

Nanak accepted Hindu ideas of karma and rebirth but rejected what was viewed as the worship of idols and caste separations and inequalities. Instead, he viewed God as formless and preached meditation, honest labor, and sharing the fruits of labor as the way to seek union with God. Nanak's preaching and praying in the local Punjabi language, instead of the Sanskrit of Hindu rituals or the Arabic of Muslim prayers (languages less known by local people), helped him to reach ordinary Punjabis. In addition to praying (such as the daily Japji), a Sikh was supposed to behave courteously and honorably toward others, maintain cleanliness, give charity, and keep his reverence for God. No diets, fasts, or other austerities were recommended.

Before Nanak died in 1539 he named Angad, a close companion, to succeed him as guru. Guru Angad wrote out Nanak's hymns in his newly refined script called *gurumukhi*, or “guru's mouth.” The gurus usually chose their successors, although sometimes disputes and rifts developed within the community. Arjan, the fifth guru, compiled the Sikh holy book *Guru Granth Sahib* by including in it the teachings of the Sikh gurus and also of many Hindu bhaktas (devotees of God) and Muslim Sufi saints. He

also constructed the Golden Temple at Amritsar, the holiest Sikh shrine.

Later gurus developed the political role of the Sikh community and also fostered a turn toward militancy, especially after the fifth and the ninth gurus. The fifth guru angered Mughal leaders when he provided refuge to a Mughal political rebel, and the ninth guru had defended a group of Hindu Brahmins. Gobind Singh, who became the tenth and last guru (1675–1708), completed the conversion of the Sikhs into a martial brotherhood. In 1699 he proclaimed the order of the *khalsa*, or “pure.” Members promised to die rather than give up their faith, and they agreed to wear always the “five K’s”: uncut hair (usually wrapped in turbans), combs, underpants, sword (or knife), and bangle. He announced that there would be no further gurus and that disputes within the community would be settled by an assembly of the *khalsa* and its leaders.

In 1708 Gobind Singh appointed a zealous young ascetic, Lachhman Das, to succeed him and lead the *khalsa* community. This ascetic declared that he was the slave of the guru and took the name Banda, meaning “slave.” When Gobind Singh was assassinated, the charismatic Banda became the leader. He toured the Punjab countryside, raising armies from the Sikh and non-Sikh peasantry. These rebellious peasants slaughtered their landlords (many of whom were Muslims) and plundered their lands. They also demolished the fort of the nawab of Sirhind who had ordered the death of the two younger sons of Guru Gobind Singh. Consequently, the Mughal emperor Bahadur Shah dispatched an army to the Punjab. Banda was eventually defeated, tortured, and killed along with 700 of his associates in Delhi on June 9, 1716.

Banda’s death was followed by a long period of guerrilla struggle by the Sikhs against the Mughal empire until 1799 when one Sikh chieftain, Ranjit Singh, captured Lahore and became the first Sikh ruler of the sovereign state of Punjab (northwestern India). The region was annexed by the British in 1849, and it was partitioned at the end of British rule in 1947. The Muslim majority areas of West Punjab went to Pakistan, and the Hindu-Sikh majority East Punjab went to India.

Although there have been cycles of violence and nonviolence in their struggle for identity

and political power, the Sikhs have now largely taken to constitutional and peaceful ways of defending their faith and rights. While Sikhs historically have concentrated mostly in the Punjab region, the land of the birth of their faith, they are now settled all over the world.

Christian Humanism in Europe

Humanism is an intellectual and philosophical construct that emphasizes the value of the individual and the importance of human abilities over religious ideas that traditionally place humankind within the framework of God’s creation. As a movement that had its distinct origins within the renewed study of the classical humanities during the Renaissance in Europe, humanism attracted scholars who were usually devoutly Christian but also saw significant value in promoting the secular nature of the human existence. Humanist thinkers of the era saw humanity as capable, resilient, and enterprising and as beings capable of making rational decisions apart from organized religion. In this way, the movement seemed to contradict the early Christian teachings of St. Augustine that man was free only to choose sin. Many humanists of the era also had no conflict with renewing many of the pagan concepts associated with the period of classical antiquity and did so through use of the classical languages of Latin and Greek.

Viewed historically, humanism appears to be either the result of the Middle Ages or, alternatively, the starting point for the modern age.

➤ ST. JUSTIN MARTYR'S *FIRST APOLOGY*

Among the intellectual influences of Christian humanism, the second-century Christian apologist St. Justin Martyr may have been the first to offer the idea that Christianity expressed within it the intrinsic value of humankind. In Martyr's *First Apology*, he argued that Christ allowed human culture but was ultimately in control of that culture. This early expression of humanism balanced the importance of human imprint upon culture with the need to recognize the principles of Christianity as having precedence over it. When viewed in this historical framework, Christian humanism was not an idea new to the Renaissance but was indeed a renewal of ancient thought that could be found as fully expressed in Christian thought as it was in pagan secular philosophy. The Christian humanist believed that God created man in His image and that God became man through the Incarnation of Jesus Christ. This understanding of the mystical union of God and humankind served as a solid foundation for espousing Christian humanism. In this way, the worth of the individual, a concept lost during the Middle Ages, was completely consistent with Christianity. This message of the Renaissance era wedded social concerns with the potential promised by human introspection, creating an intellectual environment that nurtured the future ages of the Scientific Revolution and the Enlightenment. Christian humanism has therefore profoundly influenced the thought of Western civilization.

—Cheryl H. White

Humanism is therefore a transitional movement that bridges two periods of human history while representing a renewed way of thinking. Unlike modern humanism, however, the humanism of the Renaissance was predominantly Christian in its orientation to scholarship. In fact, one of the distinguishing characteristics of this Christian humanism was its ability to offer faithful support to the established orthodoxy and doctrines of the Church while being sharply critical of many of its better-known and flagrant abuses. For example, one of the most controversial but noted of the fifteenth-century Italian humanists, Lorenzo Valla (1407–1457), used his skills as a classical scholar of Latin texts to prove that the *Donation of Constantine* was in fact a medieval

forgery of the Church. This document, purportedly authored by Emperor Constantine in the fourth century, made bold assertions about the authority of the pope over territories once part of the western Roman empire. The exposure of the document as a forgery served to increase cynicism and skepticism about the abuses of the late medieval Christian Church. The proper use of the term “Christian humanist” is limited to the description of scholars who had classical training in languages and rhetoric and used that training to address religious or theological issues. This description applied to a great many humanists of the Renaissance age.

The fact that Renaissance humanism had its beginnings in Italy was due in large part to the independent political nature of the Italian states and the fact that the commercial prosperity of the age financed a renewal there of classical art, literature, and philosophy. The establishment of the Platonic Academy in Florence by Cosimo de' Medici at the height of the Italian Renaissance in the middle of the fifteenth century expanded the intellectual outlook of humanism. The school encouraged the exploration of philosophical ideas about the nature of humanity and the place of humans in relationship to all of Creation. The school's scholars produced a Christianized concept of Platonic philosophy that influenced other Renaissance thinkers in Italy and throughout the rest of Europe. Through the patronage of powerful families such as the Medici, the movement of humanism was able to evolve beyond the examination of political and social institutions and promoted the use of history and languages to learn more about the possible meanings of human existence. The context of Christianity framed much of this intellectual exploration.

It was not long before humanism found expression outside of Italy. Humanism flourished among English thinkers of the age such as John Colet (1467–1519), who applied the characteristically humanist critical methods of language study to his work on Holy Scripture. In the Netherlands, Desiderius Erasmus established himself as a highly influential Christian humanist by satirizing the Church in works such as *Praise of Folly*. Erasmus was himself an ordained priest of the Church and a university teacher who made his home in various places throughout Europe

during his lifetime, expanding his influence on various other humanists of the age. One of the most significant contributions of Erasmus was his work to synthesize the teachings of Christianity with that of ancient pagans, which worked to place Christianity firmly within the movement to renew classical antiquity. Erasmus also produced a Greek translation of the New Testament in 1516 as well as Greek and Latin translations of the Church Fathers. He intended for his scholarship to introduce a rational approach to Christianity, contrasting the Aristotelian approaches of medieval scholasticism. By the end of his life, Erasmus evoked controversy as Protestants attempted unsuccessfully to garner his support for their cause.

Sir Thomas More, lord chancellor to King Henry VIII of England, was a friend and close associate of Erasmus. More published his signature work, *Utopia*, in 1516 and used the storytelling setting to attack human corruption evident in various social structures of the age. That same year Erasmus published a Latin work, *The Education of a Christian Prince*, which was, as the title suggests, a manual for princes to learn how to rule benevolently and peacefully. Both of these works greatly championed the cause of Christian humanism by appealing to a need to understand both the human condition and the societies framing the human existence. Both men were attentive to linking their intellectual explorations to a distinctly Christian ethic. Whereas the Church had traditionally asserted that promotion of the importance of the individual was tantamount to arrogance and sin, Christian humanists believed that the good of the individual was applicable on a broader scale to all of humanity.

The impact of Christian humanism on Western civilization became evident in the advancement of individualism, the approaching Scientific Revolution, and empirical observation and the development of the scientific method and served as the intellectual foundation for the Enlightenment. The medieval worldview had been God-centered and therefore restricted individual expression and exploration of meaning. In the age of the Renaissance, the renewed interest in the civilizations of classical antiquity brought about a rebirth of pagan secular ideas

that emphasized the value of the individual. Within the intellectual environment of that era, Christian humanists were able to promote simultaneously both the values of Christianity and the aspirations and abilities of humankind.

Baldassare Castiglione and His Idea of the “Renaissance Man”

Baldassare Castiglione (1478–1529) was an Italian author during the High Renaissance, best known for his definition of the Renaissance man in his 1513 work *Il cortegiano* (*The Book of the Courtier*). Castiglione was born at Casatico near the Lombard city of Mantua in 1478. A poor aristocrat, he made his way by dint of his achievements. Castiglione was educated in Milan by the Humanists Girgion Merula and Demetrius Chalcondyles and then became a courtier at the court of Ludovico Sforza and became adept in the art of chivalry. In 1499 Castiglione entered the service of Francesco Gonzaga, the marquis of Mantua, his maternal relative, and this began his career. In 1507 Castiglione entered into the service of Guidobaldo da Montefeltro, duke of Urbino, where he met Pietro Bembo, Bernado Bibbiena, Guiliano de’Medici, l’Unico Aretino (Bernado Accolti), Ludovico di Canossa, and Ottaviano and Federico Fregoso. Castiglione served as ambassador for Urbino to the papal court of Leo X in Rome in 1513 and as a papal nuncio to the court of Emperor Charles V in 1525. Disappointed with the sack of Rome in 1528, Castiglione retired to Toledo, Spain, where he died in 1529.

Castiglione wrote several works, but his most important was *Il cortegiano*. It taught his

view of *cortegiania*, that is, the standards of conduct for the perfect gentleman, who lives in the courts of princes. It was written between 1513 and 1518 and revised until published in 1528. Set at the court in Urbino, which he knew well, *Il cortegiano* is organized into four books as a series of dialogues between the ladies and gentlemen at the court in Urbino over four successive evenings. To entertain themselves each evening they play games, the first of which is to describe the ideal courtier. However, the ideal or perfect courtier is for them a relative concept and not one of the eternal forms sought in the Platonic dialogues. Unlike the Platonic dialogues, which were only between men, Castiglione's dialogues included men and women and resemble the entertainment of the ladies and gentlemen in *The Decameron* (1353) by Giovanni Boccaccio (1313–1375). Their discussions range over topics such as the art of conversation, sex, love, and politics.

Castiglione's interlocutors describe the perfect courtier as a "Renaissance man" who is preferably of aristocratic birth (but need not be, because the true courtier is made by intellect and character) and is scholarly, a connoisseur, brave, skilled at arms, musical, poetic, witty, and speaks the *lingua cortegiana*, or court language. The courtier's style of behavior is studied negligence, which is an effortless grace (*sprezzatura*) or nonchalance concealing all art while making him loveable at first glance. The book also indicated the period's womanly ideal—both beautiful and discreet—and the ideal for interactions between the sexes.

Il cortegiano presented the highest moral aspirations of the Renaissance as a model for virtuous action, which many did not reach, and provided a standard toward which to aspire. It taught civility to many Italians and other Europeans. As the courts of kings grew in the number of attendees that included people other than the knights of the kings, there emerged opportunities for advancement for people who were not from the nobility. Often members of the clergy, secretaries, soldiers, entertainers, physicians, or others who had not been "born to the manor" and hence were not schooled in the manners of the nobility made their way to courts. By being taught the style of the perfect courtier, those

from below could advance, and those from above could develop refinement.

The influence of *Il cortegiano* made Castiglione the guide to aristocratic manners during the Italian Renaissance. Setting a standard for Western tastes and being of high literary caliber, it was soon translated into other languages (Spanish, French, and English) in new editions issued virtually every year until the early 1600s. It had a major impact upon the manners of the Renaissance and post-Renaissance gentry. Thomas Hoby translated it into English as *The Courtier* (1569) because it offered the antidote of social refinement to the existing "barbarity" of English manners. Sir Philip Sidney, who was called the "ideal English courtier," kept a copy of it with him at all times.

Around 1555 Giovanni Della Casa published "The Perfect Gentleman." It presented specific manners for polite society and was intended for a broader audience rather than as a guide only to courtly etiquette. In defining a genre, Castiglione's and Della Casa's works stimulated related works for molding the manners of the cultured classes. Others extended the image of the gentleman, an influence until today.

Skepticism

The term "skepticism" in early modern Europe referred to the philosophical belief that it was impossible to have certain knowledge of

anything. Skepticism meant that all knowledge, including scientific knowledge, was open to question. It identified seekers after certainty as “dogmatists.” There were three main sources for the revival of skeptical philosophy in the sixteenth century after a long period in the Middle Ages when it had played little role in European thought. The humanist revival of ancient Greek philosophy led to a rediscovery of the ancient skeptics, the growing awareness of the diversity of world cultures led to doubt of the universal validity of European customs, and the religious conflicts of Protestants and Catholics led to questioning of religious authority.

Greek manuscripts of the leading source for ancient skepticism, *Sextus Empiricus*, began to circulate in the late fifteenth century, and in 1562 Sextus’s works were published in Latin translation in France, the stronghold of skepticism in the sixteenth century. There were two major forms of ancient skepticism. Moderate or Academic skepticism asserted that nothing could be known for certain, while radical or Pyrrhonian skepticism asserted that it could not be known for certain that nothing could be known for certain. Radical skepticism was more influential in the early modern period.

The growing awareness of the diversity of the world’s cultures as travelers’ accounts of Asia, Africa, and the Americas proliferated caused some to question the universality of European mores and in a few cases even religion. The fact that societies could function with a wide range of beliefs and practices made it harder to argue that any were “true.”

Skepticism also spread through its use in religious conflicts. Protestants and Catholics used skeptical techniques to attack the foundations of the other side’s beliefs. Protestants claimed the Bible as the sole source of religious truth, but Catholic skeptics responded by asking how, in the absence of an authoritative institution, Protestants could be sure they had interpreted the Bible correctly. Protestants used skeptical arguments to attack Catholic reliance on the authority of the institutional church and the pope. Even if the pope can be sure of the right answer to a theological question, how could any believer be sure that the person claiming to be pope was actually pope? Skepticism was also employed by

radical reformers who supported religious toleration. Since religious truths could not be known certainly, it made no sense to punish those who disagreed with the majority. Some argued that skepticism destroyed all possibility of attaining truth through reason; therefore, the only way to know truth was through religious faith.

The best-known and most influential skeptical writer was the French Catholic essayist Michel Eyquem de Montaigne (1533–1592), the inventor of the essay form. The first two volumes of Montaigne’s *Essays* were published in 1580, followed by a completely revised edition of three books in 1588. A third edition with further revisions was published posthumously in 1595. As a skeptic, Montaigne’s motto was *Que sais-je?* (“How do I know?”). As a skeptic, he held that people should be even-tempered and tolerant. Montaigne was willing to challenge many of the most basic beliefs of his readers. One of his most famous essays, “On Cannibals,” contrasts Native Americans with French society, suggesting that the “savage” custom of eating a man after he is dead is not worse, and perhaps better, than the European practices of torture and burning people alive.

Montaigne was careful not to openly attack the authority of the Catholic Church. His friend and disciple the priest Pierre Charron (1541–1603) put his work into systematic form, promoting skepticism as the ideal foundation for Catholicism and presenting the Calvinists, then the Church’s chief rivals in France, as classic dogmatists. Skeptical arguments became common in French Catholic polemics against Calvinism. Catholic skepticism, which was later referred to as “fideism” due to its assertion that faith alone is the source of certainty, also attacked the mainstream Scholastic tradition, which sought certainty through reason. For this reason, Catholic skeptics always faced opposition in the Church, and Catholic skepticism never spread far beyond France. Even in France there was a vigorous reaction. The French Jesuit François Garasse (1585–1631) wrote *The Curious Doctrine of the Wits of These Times, or Pretended Wits* (1625), viciously attacking Charron and claiming that skepticism was a mask for impiety and licentiousness. The growing dominance of the Catholic Church within France led to an abandonment of skepticism in favor of dogma and authority

➤ MONTAIGNE IN ENGLAND

Michel de Montaigne was nearly as influential in England as he was in his native France. Many English people read French, so his *Essays* were widely circulated even before the first English translation appeared in 1603. The earliest references in English to the *Essays* date from the 1590s. John Florio, the translator of the *Essays*, was a tutor in French and Italian to young English noblemen and women. (Florio was of Italian descent but was born in London.) The three folio volumes of Florio's translation are each dedicated to noble women. Montaigne, a nobleman himself, was considered appropriate reading for young nobles. James Cleland's *Institution of a Young Nobleman* (1607) is largely plagiarized from Montaigne.

The influence of Montaigne on Shakespeare has attracted much interest, going back to the eighteenth century. The clearest example of Montaigne's influence, through the Florio translation, is the speech of the royal counselor Gonzalo in *The Tempest*. Gonzalo's speech to his fellow castaway, King Alfonso, describes an ideal commonwealth in language borrowed from Montaigne's essay *On Cannibals*. Montaigne's example also helped inspire the creation of the English essay. Early works inspired by Montaigne include Sir William Cornwallis's *Essays* (1600), the first collection of familiar essays in English.

—William E. Burns

by the mid-seventeenth century. The works of Montaigne were put on the Index of Forbidden Books in 1676.

Skeptics also attacked claims of certainty in natural philosophy whether they were made by Aristotelians, magicians, or scientists following Copernicus and Galileo. By the early seventeenth century several thinkers were attempting to establish knowledge on a basis immune from skeptical attack. The English philosopher Francis Bacon (1561–1626) believed that his empirical approach to natural knowledge would overcome skeptical objections, and the Frenchman René Descartes (1596–1650) in his *Meditations* (1641) put forth a logical structure based on the famous formula “I think therefore I am,” which he hoped would be unassailable by skeptical objections.

The ultimate solution to the problem that the skeptical assault on certainty posed in science was mitigated skepticism, which defined the scientific project not as one of seeking certainty but rather as seeking to make statements so highly probable that one was justified to act as if they were certain. Mitigated skepticism, often identified with an intellectual modesty that refused to go beyond the observed facts, was most fully developed in late-seventeenth-century England, where it was characteristic of the natural philosophers of the Royal Society chartered in 1662. Modified skepticism developed in opposition to both the dogmatic Aristotelianism characteristic of the university curriculum and the “enthusiastic” claim to certain knowledge by direct revelation from God that many blamed for the English Civil War of the midcentury. This skeptical approach was put forth in writings identified with the Royal Society and its program such as the Reverend Joseph Glanvill's (1636–1680) *The Vanity of Dogmatizing* (1661), republished with additions in 1664 as *Scepsis Scientifica* with a dedication to the Society.

Bible Translations and Historical Criticism

The early modern period was a great age of Bible translation. Among the reasons for this were the revived interest in ancient texts fostered by the humanist movement and the use of the Bible in the religious polemics of the Reformation era. Bible translations such as Martin Luther's German Bible (1534) or the King James Version (1611) in English had immense influence on their churches but also on the development of vernacular languages. Vernacular Bible translation

was a fundamental obligation of Protestants. The Catholic Church was much more cautious. The centuries-old Latin Vulgate of St. Jerome remained the official text, and the circulation of vernacular Bible translations was forbidden in Italy for centuries, but the Catholic Church produced “defensive” translations to guard against Protestant distortions and provide a vernacular version for Catholics. One example is the English Douay Version, the work of the English College at Douay in northern France, published in three parts from 1582 to 1610. Like other Catholic translations, the Douay version was a translation from the Vulgate rather than the Bible’s original text in Hebrew and Greek, although it also borrowed, without acknowledgment, from previous English Protestant translations.

Polemical interest in the Bible, combined with access to the Middle East and humanistic awareness of the problematic creation and transmission of ancient texts, led scholars to search for the oldest editions. The printing press made it possible to present their findings to a wider audience. The first printed “Polyglot” Bible, incorporating Latin, Greek, Hebrew, and Aramaic texts, was issued in 1520 and was the work of a team supported by the Spanish statesman Francisco Cardinal Ximenez de Cisneros (1436–1517). Humanistic scholar Desiderius Erasmus (1469–1536) issued a new edition of the Greek New Testament in 1516 along with a new Latin translation. Erasmus’s Greek text with a few modifications became known as the *textus receptus* and became the standard among Protestants until the nineteenth century, despite Erasmus’s several departures from the Greek manuscript tradition. (Erasmus made a particular mess out of Revelation, where his reliance on a single, incomplete Greek manuscript led him to fill in the gaps by translating the Vulgate back into Greek.)

Interest in early manuscripts led to increased awareness of the differences in biblical texts. One famous case was the “Johannine Comma,” a phrase added to the First Epistle of John to support the doctrine of the Trinity and eventually revealed as inauthentic. Erasmus omitted it from the first edition of his Greek New Testament but replaced it in subsequent editions due to pressure from Church authorities, for whom the Comma was one of the few biblical passages

➤ THE BIBLICAL EXPEDITION OF 1761

One of the most frustrating things for European Bible scholars was the lack of easy access to the settings of the Bible in the Middle East. The references to plants, animals, and geography in the Bible aroused many questions that could not be answered in a European library. To remedy this deficiency the German scholar Johann David Michaelis conceived of an expedition to the shores of the Red Sea. Frederick V, king of Denmark, financed the expedition, which consisted of a group of German and Scandinavian intellectuals, though not Michaelis himself. The members of the expedition were strictly ordered to avoid giving any offense to the Muslim rulers of the area by proselytizing for Christianity, a restriction that was controversial in Europe. The expedition, which left early in 1761, was frustrated by its inability to gain access to the Monastery of Saint Catherine in Sinai, with its legendary manuscript collection including the most important Greek manuscript of the Bible, the Codex Sinaiticus. The expedition’s botanist, Peter Forsskal, did manage to identify the source of the “balm of Gilead,” the Mecca balsam tree. Five of the expedition’s six members, including Forsskal, died in the Middle East.

—William E. Burns

supporting the doctrine of the Trinity. From there it passed into the *textus receptus*, ensuring that it would appear in Protestant as well as Catholic Bibles. Subsequent anti-Trinitarians such as Isaac Newton (1642–1727), who devoted much of his career to close study of biblical chronology and prophecy, attacked the Comma as indicative of the fraudulence of Trinitarianism, both in the early Church and in their own time.

The seventeenth century saw a diminishing interest in the details of the biblical text but expanded use of other humanistic critical tools such as establishing chronology and historical context. The increase in knowledge of Hebrew among Christian scholars along with growing familiarity with Rabbinic writings was also reshaping approaches to the Bible. The most radical critic of the Bible was the Dutch Jewish philosopher Baruch Spinoza (1632–1677), who put forth the first entirely secular reading of Scripture as

a historical document, containing much valuable teaching but not divinely inspired. Few followed in Spinoza's footsteps in the seventeenth century, and those who did were not scholars. One Deist influenced by Spinozism was the Englishman John Toland (1670–1722), who took advantage of the growing knowledge of early Christian writings to question the canonization of the Bible. He pointed out that the Church Fathers themselves did not agree on a single canon of scripture.

Spinozism raised the stakes of biblical scholarship, which was now concerned not only with differences between Catholics and Protestants but also the defense of Christianity as a whole. Dutch Remonstrant Calvinist Jean Le Clerc attempted to establish critical rules for interpretation of the biblical text, suggesting that this was the only way to defend Scriptural authority. Among the foremost Catholic biblical scholars was the French Oratorian priest Richard Simon (1638–1712), whose historical studies of the Bible were partly meant as a response to Spinoza but also as a counter to the Protestant belief in the Bible as the sole religious authority. Simon established the principle that while the Bible was divinely inspired in its original form, its subsequent copyists were not divinely protected from error. His studies, however, eventually aroused so much concern among Catholics that he was expelled from the Oratorians.

Seventeenth-century changes in biblical scholarship had little impact on biblical translation; there were very few innovations as specific biblical translations became canonical. Scholarship also had little impact on the most commonly used texts of the Bible in its original languages.

In the eighteenth century there was a return to textual scholarship, led at first by English

scholars such as the Cambridge classicist Richard Bentley (1662–1742) and then taken up by Germans such as the Lutheran Pietist and millenarian Johann Albrecht Bengel (1687–1752). Bengel began the long process of establishing the genealogy of biblical manuscripts and identifying the major “families” of early Bibles. Biblical study also assumed a more secular cast in many places. Even pious Christians like Bengel seldom identified their biblical studies with the quest for theological truth. In the generation after Bengel, Germany took the lead in biblical textual scholarship. Germany was particularly suited to support specialized scholarship due to its numerous Church-affiliated universities, many of which supported professorships in biblical studies. Important biblical studies still appeared in Britain. The Oxford professor Robert Lowth's *Lectures on the Sacred Poetry of the Hebrews* (1753), originally delivered in 1741, revolutionized the study of the Hebrew Bible by identifying the poetic conventions used by biblical writers.

■ Introduction: Envisioning Each Other

The most significant aspect of this era, 1450–1770, is that for the first time in millennia, most of the peoples of the world were brought into contact with each other. Over the years, isolated societies had addressed their environment and circumstances in various ways,

each of which gradually evolved into “the way” in which matters should be addressed. The cross-cultural contacts resulting from the European explorations were rarely smooth, as one consequence was that these assumed “ways” were called into question. The newly introduced

societies adapted to each other in various manners; generally through attempts to trade, other times through wary surveillance or violence. Often the societies attempted to understand newcomers within the context of their existing mythology, such as the “Noble Savage” context in which some Europeans viewed Native Americans. The more technologically advanced and politically cohesive a society, the more likely it was to stay intact after Europeans came into the picture. Japan, for instance, was able to control European access and to develop the technology and internal structures to survive. The arts, literature, and thought of this period indicate how different groups assessed one another and, at times, called into question their own core beliefs.

—Carolyn Neel

An Amazingly Curious People—Dutch Maritime Accounts

Even before the establishment of the Verenigde Oostindische Compagnie (VOC, United East India Company) in 1602, the people of the United Provinces (today’s Netherlands) were investigating trade routes in the Atlantic, Indian, and Pacific oceans. Many of the seamen on these voyages and later voyages of the VOC and its sister company, the West Indische Compagnie (WIC, West India Company), established in 1621, compiled journals documenting trade information and their own personal impressions of the landscape, flora, fauna, people, and cultures they encountered. These travel accounts are useful primary source documents that not only provide concrete information concerning trade practices and prices for historians of economics but, more recently, are also being interpreted by social historians, art historians, and anthropologists as documents that recorded the nature of the European, and specifically Dutch, interaction with and perception of non-European peoples.

Many of the accounts included printed illustrations of the indigenous flora, fauna, and people. In conjunction with the text, these pictorial and textual descriptions were often marketed as *naer het leven* (“from life”). In the early modern period the authority of a source was deduced by the ostensible veracity and documentation of

that which was directly observed. This was in contrast to earlier reliance on classical sources.

One of the earliest and most influential chroniclers of Dutch trade and travel in India, Southeast Asia, and Africa was Jan Huygen van Linschoten. Linschoten’s *Itinerario* was published in Amsterdam in 1596. The *Itinerario* included 32 engravings of market scenes, peoples, and various other Indian naturalia. Linschoten was a clerk for the Portuguese archbishop in Goa, on the west coast of India. The *Itinerario* sparked many subsequent Dutch voyages to the East Indies. A shorter version, the *Icones*, was also printed and indicates the popularity of travel accounts to the European market.

Other travel accounts were printed copiously in the seventeenth century. The VOC was incorporated in 1602, and many of its trade expeditions included someone who journaled about the events of the trip. Jan Nieuwhof documented a trip to China and to the East Indies in *An Embassy from the East India Company of the United Provinces to the Grand Tartar Cham Emperor of China* (1669) and *Voyages and Travels to the East Indies, 1653–1670* (1682). In Africa, Pieter de Marees wrote about the peoples of the Gold Coast of western Africa in his *Description and Historical Account of the Gold Coast of Guinea* (1602). As with many printed materials in the early modern period, information and artistic conventions were

Gathering of spices in India, illustration from Jan Huygen van Linschoten: History of the navigation of his voyage to the East Indies, 1638. (Library of Congress)

► NICOLAUS DE GRAAFF

The *Reisen van Nicolaus de Graaff, 1639–1687* (Travels of Nicolaus de Graaff, 1639–1687), was one of many travel accounts published and circulated in seventeenth-century Europe. Nicolaus de Graaff was a surgeon for the Dutch United East India Company (Verenigde Oostindische Compagnie). Originally from Hoorn, de Graaff spent almost 50 years traveling to the many ports where the Dutch traded. He journeyed to South America, Greenland, and the Levant. He sailed around the Cape of Good Hope five times to get to the spice islands of the East Indies. De Graaff recorded many detailed descriptions of daily life and human interaction both on and off the ships. In a lengthy passage, he listed the punishments that crew members might receive for disobedience. Sailors might be hit with the butt of a musket, put in heavy armor, flogged with a thick rope, dipped from the yardarm into the water, or keel-hauled three times. Descriptions such as these provide historians with insight into the formation of the Dutch empire.

—Elizabeth Sutton

frequently lifted from prior accounts without citing those sources. Olfert Dapper's later account of Africa, the *Description of African Provinces* (1668), has sections that derive from de Marees and Linschoten. Nieuhof's accounts have sections owing to Linschoten.

In addition to accounts of Asian travel, the Dutch who journeyed across the Atlantic also documented their observations in text and image. After the Dutch conquered Brazil from the Portuguese, Governor Johan Maurits van Nassau-Siegen commissioned the artists Albert Eckhout and Frans Post to create paintings of Brazil's peoples and landscape. Maria Sybilla-Merian was a female artist who traveled to Brazil and Surinam and documented in intricate and detailed watercolors the plants and animals of the region.

The written and pictorial accounts of the Dutch are very useful for today's historians. However, it is important to remember that the impetus for many of these accounts was Dutch imperial interests. Despite the seemingly innocuous text and pictures by merchants and colonizers, Dutch hegemony in trade did have

nefarious consequences. The VOC used military force to establish itself in the Asian spice trade. Across the Atlantic, sugar plantations in Brazil and Surinam were lucrative because of slave labor. The WIC exported African slaves to Dutch colonies in Brazil, Surinam, and New Amsterdam (New York).

Ethiopia Oriental—Europeans Imagine Africa

“Ethiopia Oriental” is an outdated expression from the medieval period that refers to the Oriental coast of Africa, more precisely Africa supra Ægyptum, a territory stretching from the Cape of Good Hope toward the Red Sea. Mythical kingdoms originated here, namely the kingdom of Prester John and the kingdom of what the Portuguese called Monomotapa (the Kingdom of Mutapa spanned what is present-day Zimbabwe and Mozambique). Europeans knew of this region thanks to the Portuguese explorers and their efforts to explore down the western coast of Africa. This geographical area belonged to the Estado da Índia, the Portuguese State of India

of which Goa was the capital. Places of trade, called *feitorias* in Portuguese, were established along the coast: Sofala in 1505, Mozambique in 1507, and Sena and Tete on the Zambesi in 1531. In 1609 the Dominican missionary João dos Santos (ca. 1560–1622) published an account of his sojourn titled *Ethiopia Oriental e varia história de cousas notaveis*. The king of Portugal sent an embassy to Prester John during the 1520s. Francisco Álvares (ca. 1490–1536), the chaplain who accompanied the ambassador, also wrote a text titled *Verdadeira Informação sobre a Terra do Preste João das Índias*, published in 1540. Beginning in the seventeenth century, Dutch, English, and French people also sailed in the Indian Ocean and published works. Europeans thus had access to a considerable amount of literature about Ethiopia Oriental.

In spite of the numerous publications describing the area, Europeans often had a false idea of this region. At the beginning of the sixteenth century, Europeans identified modern-day Ethiopia with the Christian kingdom of Prester John, with which they tried to make contact. Religious orders, especially Dominicans, wanted to appropriate Christianity's origin and especially Ethiopian monkhood.

Then, European attention turned to Southeast Africa. From the very first explorations, the Portuguese promoted the region as a land of plenty. Their accounts claimed that the kingdom of Monomotapa contained great wealth: the Zambesi river and the hinterland of the port of Sofala were presented as lands of gold. The king of Monomotapa was said to possess herds of elephants in the same way Europeans possessed herds of cows. André Thevet (ca. 1503–1592), the French royal cosmographer, portrayed the king as going to war, surrounded by his people and perched on a richly decorated elephant. The king was believed to have numerous wives, and the land was believed to abound with springs and rivers.

At the outermost bounds of the known world, European myths took shape in Southeast Africa. First, Europeans thought that Amazons lived in the kingdom of Monomotapa. Organized in war troops, they accompanied the king during campaigns. This idea was diffused namely by Filippo Pigafetta (1533–1603), an Italian

➤ JOÃO DOS SANTOS, *ETHIOPIA ORIENTAL*

Written by the Portuguese Dominican João dos Santos (ca. 1560–1622), *Ethiopia Oriental e varia história de cousas notaveis* was published in Evora in 1609. Concerning Africa Supra Ægyptum, this book is particularly interesting for the history of Southeast Africa, which is the territory that stretches from Delagoa Bay toward Querimba Islands. The author lived in this region for 11 years (1586–1597). This missionary account is divided into two parts. The first part is devoted to Oriental Africa from a geographical point of view, and the second part discusses oriental Dominican missions.

In this work, João dos Santos describes his own missionary experience and provides excellent information on Southeast Africa. He also surveys the rest of the territory using informants and readings. *Ethiopia Oriental* successfully interweaves Santos' missionary experience with details he compiled from his library resources. Indeed, he used some works that he derived from his humanist education but does not rely solely on them. He offers readers a most realistic picture of Oriental Africa at the end of the sixteenth century and undertakes some literary reviews, confronting contemporary works. However, *Ethiopia Oriental* remains a Dominican work, and some events, notably the Jesuits' action in this area, did not appear.

—Florence Pabiou-Duchamp

chronicler and traveler, in his work titled *Relatione del reame di Congo*. João dos Santos goes back over this question and refutes it. Second, Europeans thought that the queen of Sheba possessed a trading post in the kingdom of Monomotapa. This is how they explained the presence of certain mountaintop ruins. According to João dos Santos, Muslims of this region gave the same explanation. Exported from the Indian Ocean toward the Red Sea, the queen's gold was allegedly used for the construction of Solomon's Temple. This assertion appears in several works of the sixteenth and seventeenth centuries, namely *Ethiopia Oriental* and in the wreckage account of the *Santiago* ship in 1585. Finally, Southeast Africa was the subject of several famous poems. The Portuguese Luís de Camões (1524?–1580) devoted a song and a sonnet to it in his epic *As*

Lusiades, and Jean de la Fontaine's (1621–1695) fable *Deux amis* also took place in this kingdom.

In fact, Europeans wished to reform Ethiopia's Christianity. In the 1550s a Jesuit mission was sent there. Concerning the kingdom of Monomotapa, João dos Santos's works had put some myths into perspective. Nevertheless, Europeans refused to believe that the ruins were of African origins. Even when the German geologist Carl Mauch (1837–1875) discovered the Great Zimbabwe site in 1871, he believed that he was before copies of Solomon's Temple and of the queen of Sheba's palace, which shows that the legends persisted into the nineteenth century.

South Asia Imagines Europe

Though there had been contact between South Asia and Europe in the ancient past in the form of Alexander's invasion of the northwestern regions and subsequent interactions with the Indo-Greek kingdoms as well as trade with the Roman empire in the ports along the western coast and the occasional solitary visitor (such as Marco Polo in the thirteenth century), there was no large-scale contact between South Asia and Europe until the late fifteenth century, with the arrival of the Portuguese expedition of Vasco da Gama. The arrival of da Gama marked the beginning of a period of extensive interaction between South Asia and Europe, culminating in the British Raj, the period of direct British rule of most of the subcontinent.

European domination of South Asia did not occur all at once and was not, in fact, the original intention of the first European visitors. The Portuguese, soon followed by the Dutch, the French, and the British, were initially interested only in trade. These powers entered into agreements with local rulers to establish coastal ports. For the most part, European interaction with South Asians was confined to these port cities. It was only the British who were eventually to expand their coastal foothold into a sizable empire, and this expansion did not begin in earnest until the late eighteenth century.

In addition to trade there was Christian missionary activity, which did involve individual European missionaries traveling beyond the European port cities and into the interior of South Asia. But the missionaries were relatively few in number, and at least in terms of numbers of converts, their impact on South Asian society was fairly marginal, though the Catholic missionaries in the southern part of India did have some successes, and this part of India has a significant number of Christians today. This region, however, had long had an indigenous Christian presence since at least the fifth century CE.

Prior to the relatively large-scale arrival of the Europeans as trading partners, the perception of foreigners in South Asia was largely negative, and foreigners themselves were of only marginal interest, particularly the dominant Brahmanical traditions. The Buddhists did take an interest in other countries and their peoples, being committed to missionary activity and spreading Buddhism throughout Asia. But by the end of the thirteenth century, Buddhism had largely died out in South Asia. The words for foreign peoples, *mleccha* and *yavana*, had mainly negative connotations. The word "mleccha" can be translated as "barbarian," or someone lacking in culture. The word "yavana" originally referred to persons of Greek origin but became a generic term for people from the West and was as much applied to Arabs, Turks, and Persians as to Europeans. A yavana was perceived for the most part as a violent invader and, as with mleccha, a person lacking in culture.

With more frequent contact, this perception of Europeans did not change. Indeed, this increased contact was seen by at least some

➤ EARLY EUROPEAN MISSIONARIES IN SOUTH ASIA—A VARIETY OF APPROACHES

Early European Christian missionaries in South Asia created controversy, not only among the non-Christians they were seeking to convert, but also among their fellow Europeans. One such missionary was the Portuguese Jesuit, Robert De Nobili. Unlike many of his fellow Christians, who looked down on traditional Hindu customs and beliefs, De Nobili believed that it was important to show respect for those Hindu traditions that he

found to be compatible with Christianity. In order to reach Hindus with his Christian message, De Nobili adopted the dress and customs of the Brahmins, the traditional religious teachers of Hinduism. The religious authorities of Europe were skeptical about this approach, called *acculturation*, which has since been adopted by many Christian missionaries.

—Jeffery D. Long

Hindus as a harbinger of an apocalyptic age, the end of the present world-age, or Kali Yuga. It was lamented at this time that “low,” “vile” (*nica*) foreigners such as the British had seized power in parts of India, a fact presented in a Sanskrit text of this period as a danger to the traditional Hindu social order comparable to the seizure of power by the demonic villain Ravana in the epic *Ramayana*. Another text refers to the Europeans as *gurunda*, which means “one who mutilates cows,” and the barbaric status of these foreigners is attributed to their practice of eating beef. The *gurunda* are said to have come to India “for the sake of trade.” It is also claimed, interestingly, that they are adherents of Buddhism. This latter claim may reflect a poor grasp of Christianity, which does bear some superficial resemblances to Buddhism; the fact that earlier Europeans with whom the Hindus had had contact—the Indo-Greeks—were Buddhist, and this past reality was simply projected onto the contemporary situation; or a combination of the two. In general, the coming of Europeans was seen as a harbinger of social disintegration.

Despite these negative characterizations of Europeans in Brahmanical texts, it is also the case that a number of South Asians, including Brahmins, worked closely with the Europeans, engaging in trade with them but also assisting them in understanding Indian culture and even aiding Christian missionaries in translating Sanskrit texts, for example, and explaining the philosophical concepts and practices of Hinduism. It could well be that the negative depiction of Europeans in texts of the period of early contact presents a reaction against an initially friendly

and cooperative relationship between some Hindus and this new foreign presence in the subcontinent.

China and the Western Barbarians

The Chinese, for millennia, had been aware of barbarians, both those with a proper attitude and those who rudely intruded into the realm of the civilized people, the Chinese. During the late fifteenth century, as global cooling was reducing pastureland in the Eurasian steppes, nomads once again began pressing against Chinese borders. The Chinese had been dealing with the steppe peoples for more than a thousand years, sometimes trading with them, sometimes conquering them, and occasionally, being conquered by them. They generally categorized these foreigners as hopelessly uncivilized unless the foreigners made the proper attempt to emulate Chinese culture, in which case they were considered “half-cooked,” meaning that although not yet culturally Chinese, at least they tried.

The Portuguese were the first western Europeans to sail directly into a Chinese port, navigating from the Malaysian state of Malacca to the south Chinese coast of China in 1514. In

➤ A COMPLAINT FILED AGAINST THE JESUITS

In his *Journal*, Matteo Ricci (1552–1641) discusses a complaint against the Christian missionaries filed with a local magistrate. Ricci quotes from the document as follows:

“These men [the Christian missionaries] teach that we should pay no respect to the images of our ancestors, a doctrine which is destined to extinguish the love of future generations for their forebears. . . . In the beginning they lived in small houses but by this time they have bought up large and magnificent residences. The doctrine they teach is something infernal. It attracts the ignorant into its fraudulent meshes, and great crowds of this class are continually assembled at their houses. Their doctrine gets beyond the city walls and spreads itself through the neighboring towns and villages and into the open country, and the people become so wrapt up in its falsity, that students are not following their course, laborers

are neglecting their work, farmers are not cultivating their acres, and even the women have no interest in their housework. . . . These priests distribute pictures of some Tartar or Saracen, who they say is God, who came down from Heaven to redeem and to instruct all humanity, and who alone, according to their doctrine, can give wealth and happiness; a doctrine by which the simple people are very easily deceived. These men are an abomination on the face of the Earth, and there is just ground for fear that once they have erected their own temples, they will start a rebellion.”

1535, the Chinese granted Portugal permission to dry their cargoes in Macao, but the Portuguese pressed for more. The Chinese easily rebuffed the Portuguese when they tried to force their way into Canton (Guangzhou) in 1521 and 1522. The unruly Portuguese breached Chinese protocol often, convincing the Ming dynasty that they had no conception of the proper way to approach the Celestial Kingdom. Not only were these Portuguese aggressive about trade, but they also participated in smuggling and piracy. Rumors circulated that they might be cannibals, as well. To make matters worse, in an age in which many Europeans believed bathing was dangerous, the Portuguese sailors smelled bad. The Chinese tried to avoid being in close proximity to them. Later, when the Spanish, Dutch, and others joined the Portuguese, the Chinese saw little reason to differentiate between them. They were simply the “red-haired barbarians,” not even as civilized as the northern steppe peoples. It was not an auspicious introduction to European trade.

In one of those coincidences that appear to haunt historians, the Ming appetite for silver

grew as the mines of the Spanish New World colony of Potosi went into high production. In China, the value of silver was set by a competitive market, not by a bureaucracy. Europeans became welcome traders. As much as a half of the silver mined in Spanish colonies ended up in the Ming empire. Guangdong, Fujian, and Zhejiang thrived. The bothersome barbarians also brought muzzle-loaded guns and cannons, which impressed Chinese military leaders. Despite their rude manners and ill scent, Europeans became a significant element of the South China trade networks.

The Portuguese sailors may have been a bit uncouth, but they brought with them a group of the most highly-educated and sophisticated Europeans of the day: the Jesuit missionaries. As might be expected, the Chinese and European literati found much to discuss. By 1601, the Jesuits were situated in Beijing (as well as other cities) and eventually became fixtures in court. The Jesuits were not especially successful in Christian conversion, but they taught subjects the Ming found most interesting: mathematics, astronomy, geography, cartography, and various

military arts. After the fall of the Ming, Fr. Von Bell remained to serve the Qing. The commonalities between the Court elite scholars and the Jesuits deepened. Many Jesuits became infatuated with Confucianism, defining Chinese rituals as “civic observances” rather than pagan rites. However, Franciscans and Dominicans introduced complications to the relationships when they complained to the pope about Jesuit toleration of “paganism.” In 1634 a Franciscan, Francisco de la Madre de Dios, and a Dominican, Francisco Dias, charged the Jesuits with improper use of Christian terminology; toleration of ancestor worship and excessive veneration of Confucius; refusal to tell the Chinese that Confucius was now imprisoned in Hell; and failure to promulgate the Church laws. The accusation of “ancestor worship” was the greatest problem. Ricci and his followers considered the rituals performed before ancestral tombs to be civic in nature, that is, an act of respect akin to putting flowers on a grave, not worship.

Nevertheless, the controversy raged for years, involving the intellectuals of Europe, and finally, the emperor. There were two trials regarding the matter. In 1656, the pope decreed in favor of the Jesuits; however that was reversed in 1704. In 1715, Pope Clement XI issued a bull, *Ex Illa Die*, to reaffirm the anti-rites stand. The matter was brought to the attention of the Kangxi emperor. The audacity of a European to rule on a matter pertaining to the Celestial Kingdom infuriated Kangxi; he issued an edict banishing all Christian missionaries from China except for the Jesuits at Court. The Jesuits, unfortunately, supported the Yongzheng emperor’s brother’s claim to the throne. When the Yongzheng emperor prevailed, he took stronger steps against proselytizing Christians, banning all except those who were useful advisors to the Court. In 1742, Pope Benedict XIV reiterated the stand against the performance of Chinese rites, and Christianity lost nearly all of its support in China. The Jesuits lost their privileged place in the Chinese court.

The Chinese perception of European traders as unruly, ill-mannered boors did not alter during the period from 1500 thru 1770. But the refined Jesuits did counter the image somewhat

with the upper echelons of Ming and Qing society. There was a dramatic revision in Chinese perceptions of Europeans in the nineteenth century, but that’s a tale for another day. The Jesuit order was dissolved in 1773, and only reestablished in 1814, after the French Revolution and Napoleonic Wars. When considering the nineteenth and twentieth century tragedies resulting from China’s relationship with Europeans, it is difficult not to wonder how things might have developed if there had still been a presence in China of intelligent Europeans who deeply understood and appreciated Chinese culture. We will, of course, never know the answer.

Rangaku—Japan Imagines Europe

The advent of the restrictive trade and travel policies known as *sakoku* in the 1630s was accompanied by the violent repression of Christianity. In part because many important scientific works had been translated into Chinese by Jesuits and were thus suspect and in part because no clear lines had been drawn, for much of the seventeenth century there was a fear of having too close an association with Western intellectual trends. When Tokugawa Yoshimune took office as shogun in 1715, his interest in what the West might offer Japan promoted more open study and discussion. Free from most fears of official reprisals, Japanese intellectuals began to explore new ways of thinking. From this time on, some scholars were granted access to the Dutch who were in the capital for their court

EMERGENCE OF DUTCH STUDIES IN JAPAN

In 1639 the Dutch became the sole Western power to have diplomatic and trading relations with Japan until 1854. As a result, historians, even in nineteenth-century Japan, referred to this period as *sakoku*, or “closed country.” However, through the narrow conduit of the residents of the Dutch trading factory on Deshima in the harbor of Nagasaki, information about the West entered Japan. The study of anything to do with the West was known as *rangaku*, literally “Dutch Studies” as derived from the Japanese pronunciation of Holland (Oranda).

Although these studies were never outlawed, connections with Christianity put a damper on most Western thought after 1639. For example, works on mathematics and astronomy translated into Chinese by Matteo Ricci were forbidden because Ricci was a Jesuit priest. Under Shogun Yoshimune (r. 1716–1745) *rangaku* studies were again encouraged, especially in astronomy and medicine. The interpreters to the Dutch played a crucial role in advancing *rangaku*, and many *rangaku* scholars came from their ranks. *Kaitai Shinsho*, a translation by Maeno Ryōtaku (1723–1805) and Sugita Genpaku (1733–1817) of *Tafel Anatomia* by Johan Adam Kulmus (1689–1745), was a landmark because it revolutionized the study of medicine in Japan and, as a cooperative effort by top physicians, professionalized what had been more isolated, amateurish studies.

—Martha Chaiklin

journey where they were questioned, with the aid of interpreters, on knowledge obtained from books and news of Europe. Much of the work was sponsored by daimyo as well as by the shogunate itself. One important *rangaku* (Dutch learning) scholar who exemplified this range of patronage was Otsuki Gentaku, who was a physician in Sendai, established the first private *rangaku* academy in 1786 in Edo, and was appointed the head of the newly established office of translation in the shogunate in 1811. The primary focus of shogunal interest was on medicine and astronomy and, later (especially after Chinese defeat in the Opium War in 1842),

military hardware and strategy. The publication of the first Dutch-Japanese dictionary was produced in 1816 by Dutch Factory head Hendrik Doeff. Revised by Japanese interpreters, it was presented to the shogunate in 1833. This vastly aided in the study of foreign books.

Despite its insular nature, the intellectual trend known as *rangaku*, which required knowledge of a foreign language, produced some significant results. Perhaps the most important of these was the introduction of the sweet potato by Aoki Konyo to alleviate famine in the 1740s. Artistic studies led to the production of copper plates by Shiba Kokan and Aodo Denzen in the 1780s and the introduction of Western perspective by, for example, Maruyama Okyo, who used a camera obscura just as Vermeer had. However, much of the public had some idea of the West through art and objects, although to call something Dutch was in common parlance a way to call it bizarre. From the eighteenth century, prints known as *Nagasaki-e* that depicted foreigners were popular souvenirs from travelers to Nagasaki. By the late eighteenth century, especially during the influence of shogunal official Tanuma Okitsugu (1760–1786), there was a period known as *ranpeki*, or “Dutch Crazy,” in the pursuit of foreign material culture. While only the wealthy could afford actual objects, imported textiles were imitated and forged, Dutch-decorated ceramics and copies of cut glass were made, and netsuke were carved into imagined Dutchmen.

The relationship of Japan and the West and that of Japan and China took opposite trajectories. As *rangaku* became professionalized and accepted, Chinese thought, which in the form of Neo-Confucianism had formed the basis of Tokugawa thought, became less important. *Kokugaku* (nativist) scholars such as Motoori Norinaga worked to “cleanse” Japanese thought of Chinese influences.

Native Filipino Reactions to the Spanish at the Time of Contact

When the Spanish expedition, led by the Portuguese Fernando Magellan, landed in the Philippines on March 31, 1521, they were not the first outsiders to come to the Philippines. Trade and contact with other peoples of Asia had been going on for over six centuries when Magellan arrived. Filipinos also had been traveling extensively in Southeast Asia. In fact, the Portuguese historian Tome Pires recorded that there was a community of people in Malacca he called Luções (Luzones), people from Luzon.

The initial contacts with Spaniards were generally marked by the absence of any hostility. Magellan participated in the rite of peace with the leaders he met, and Miguel López de Legazpi did the same almost four decades later. Magellan entered into negotiations with Humabon, the chieftan of Segbu (the modern-day province of Cebu), and eventually the chief and his whole family were baptized. Problems arose when the Spaniards sought to impose their will on the local leadership and population. When Magellan proclaimed that Humabon would be the leader over the other local leaders, there was resistance. Chief Lapu-Lapu, from the island of Mactan, refused to recognize Spanish sovereignty, causing Magellan to launch an attack against his kingdom. Despite being outnumbered, Lapu-Lapu's army was able to defeat Magellan and his soldiers, and Magellan lost his life. Following this incident Humabon proved to be a traitor, as he invited several of the Spaniards to dinner and had them all killed. Those few who survived set sail, and although four more expeditions were sent, there would not be another successful one until the expedition of 1565, led by Legazpi.

In addition to the indigenous people, the Spaniards also came into conflict with another set of local people: the Muslims. Islam had

➤ BLOOD COMPACT—PEACEMAKING IN THE PHILIPPINES

Peacemaking in the precolonial Philippines was performed with a *sandugo* (*sanganduguan*), which in Filipino means “one blood.” In this ceremony, an agreement was sealed between warring factions who wished to establish peace. Both parties were given a cup of wine, into which each, having cut his arm, would drip several drops of blood. The cups were then exchanged, and each party would then shake it to mix the blood with the wine before drinking the entire contents. The Spaniards would come to call this *pacto de sangre*, or “blood compact.” It is said that Magellan performed such a blood compact with Kolambo, one of the first leaders he met in the Philippine archipelago. It was on Kolambo's island, Limasawa, that the first Catholic Mass was held on March 31, 1521. Kolambo later took Magellan to Cebu, where he met Humabon. When Miguel Legazpi arrived in 1565, he performed the same compact with Si Katuna, a leader of the island of Bohol. Andres Bonifacio, a major figure in the Philippine Revolution some three centuries after these events, said that the Spaniards had broken the blood compact and used this as a rationale for the struggle against the Spaniards.

—Damon Woods

existed in the Philippines since the fourteenth century and had established trading centers there. The local Islamic leaders were unhappy that Legazpi had made Manila the capital of the Philippines, as it became the center of their activities in the region. These leaders were under the authority of the sultan of Brunei. When authorities in Brunei learned of the Spanish fort in Cebu in 1565, they sent a young noble named Soliman to help those under their authority to build up the fortifications against the Spanish. Among the weapons used were artillery.

In 1570 Legazpi sent a military force to scout Manila. On the way they destroyed forts at Mindoro and Lubang, built by Soliman. De Goiti, the head of the expedition, sent a message of peace to Manila. Soliman responded, stating a desire for peaceful coexistence and promising

the Spaniards that they could settle where they wanted. Pleased with the response, De Goiti made his way toward Manila with the intention of solemnizing their pact. Along the way, the Spaniards met villages who spoke of atrocities committed against them by the chiefs in Manila, those directly under Brunei's rule. They welcomed the coming of the Spaniards.

De Goiti, Soliman, and Raja Matanda, a local chief, met in the Manila area and participated in the *pacto de sangre*. The Spaniards were given the right to establish a settlement and the promise that they would be exempt from tribute. But De Goiti was warned that the Muslims intended to attack him and his ships. The next morning, when the Spaniards fired a cannon as a signal to certain boats, the Muslims in Manila began to fire on the Spanish ships. The Spanish burned the fort to the ground and returned to Panay. The next year, 1571, the Spaniards returned to Manila and established a permanent presence.

One group that also fiercely resisted the Spanish intrusion was the local priests of the animistic religion, who were mostly women. The new religion brought by the Spaniards did not allow women to become priests; therefore, there was a natural antagonism. The friars wrote about stubborn shamans who would try to stop the Spaniards from entering a village and would try to intimidate the political leaders by making predictions of severe consequences. When there was conflict, they would lead men into battle, shouting out curses at the Spaniards.

Those Filipinos who welcomed the Spaniards often misunderstood the Spanish intentions. Some believed that the Spaniards would liberate them from Muslim slave raiders or the Muslim overlords of Brunei. Others thought that the Spaniards simply wanted to replace the authority of Brunei with their own, allowing local leadership to stay in place. But this was not always the case, leading to difficulties and what the Spaniards would view as revolts.

Noble Savages and Howling Wildernesses—Europe Imagines America

Despite the momentous nature of Europe's discovery of America in the late fifteenth century, the most characteristic feature of European visions of the New World and its inhabitants was not shock but rather a ready desire to assimilate the new people, places, and flora and fauna into traditional European categories of interpreting the world. From images of America as a howling wilderness—largely empty, untouched by “civilization,” and full of fierce, nomadic “wild men”—to romanticized notions of the “noble savage,” these visions often reveal more about diverse strains of early modern European thought and culture than they do about the people and places they refer to.

The first travelers, conquerors, and settlers from Europe, primarily Spanish and Portuguese, arrived in America prepared by a classical and late-medieval literary heritage to find fantastic natural wonders—such as the Fountain of Youth and immense stores of gold and silver—as well as strange-looking animals and strange-looking people such as the “wild men” of European legend or the Amazon women of ancient Greek legend. Furthermore, as Christians influenced by classical authors such as Aristotle and Pliny, they expected to find entire populations not only lacking in “true religion” and sorely in need of Christian instruction but also lacking in “civilization” and practicing all manner of behaviors, such as cannibalism and polygamy that needed correction by European example and governorship. Native Americans were typically classified as “barbarians” and “pagans,” categories at once intended to radically differentiate them from Christian Europeans but also—by conceptually linking them to Europeans' own ancestors and the peoples of pagan antiquity—intended to keep them within the realm of the familiar and to express hope regarding their eventual conversion to Christianity and assimilation into European ways of life.

However, as the conquest of Mexico unfolded and as missionary efforts met unexpected resistance, European visions of America shifted away from this initial optimism. Images of ritual cannibalism and human sacrifice by the Mexica haunted the Spanish, and even though the great city of Mexico was honored by the Spanish as a rival to ancient Rome itself in its grandeur, the conquistadores' destruction of the city was regarded as necessary and even just, given Mexica ritual practices. In Spain, a Royal Council was convened in 1550 to debate whether the Native Americans were even capable of conversion and civilization. Aristotelian theories of "natural slavery" came to the fore, and scholars questioned the very humanity of the Native Americans. Some scholars, to justify violent conquest and enslavement, drew parallels to the biblical enemies of ancient Israel who practiced human sacrifice and were visited by the wrath of Yahweh. The Dominican friar Bartolomé de las Casas famously defended the Native Americans in the debate, but his defense offered a differently problematic vision of their cultures as stunted and childlike and in need of long-term guidance by Christian Europeans.

Religious differences between Catholics and Protestants also affected European visions of America. The Catholic missionary enterprise by Spanish and Portuguese religious orders in South and Central America, and later in North America by French Jesuits, Franciscans, and others, continued to grow despite many setbacks, and generally the Catholic powers supported the resettlement of Native Americans into or nearby colonial towns and cities. Catholic colonies sometimes encouraged intermarriage between Native Americans and Europeans, despite growing cultural—and increasingly racialized—objections to the practice. The Protestant powers of England and the Netherlands, however, did not show the same eagerness to convert Native Americans or to resettle them into colonial communities. English settlers in North America, for example, tended to paint images of a savage but largely empty wilderness, preferring Native Americans to keep their distance or to be driven away by force. Other Protestant travelers, settlers, and writers—including French Huguenot writers such as Nicolas Le Challeux and Jean de

➤ COLUMBUS, MONTAIGNE, AND COLDEN WRITE ON THE INDIAN

A closer look at a survey of European writings about Native Americans in the early modern period might begin with the letters and journals of Christopher Columbus, Michel de Montaigne's essay "On Cannibals" (1580), and Cadwallader Colden's *History of the Five Indian Nations* (1727).

Columbus (ca. 1451–1506) issued somewhat contradictory statements about the island inhabitants of the Caribbean. He stressed their "warlike" nature, accused them of cannibalism, and criticized their "uncivilized" lack of towns and cities. Yet he also stressed their lack of weapons, their handsome features, and their friendliness and regarded their allegedly "timorous" nature as an opportunity and justification for total subjection to the Spanish monarchs and to the Catholic Church.

The French humanist Montaigne (1533–1592) never visited America, but his stunning essay "On Cannibals" praised Native Americans for their closeness to nature and their lack of such corruptions of "civilization" as class envy, greed, and slavery. Rather than condemning Native American cannibalism, Montaigne inverted the discussion into a powerful critique of European cruelty—including incidences of cannibalism—during contemporaneous religious and political conflicts. The text was foundational to later "noble savage" discourses.

Colden (1688–1776), a British scientist and official in colonial New York, wrote the first English account of the political and social life of the Iroquois, a text that is largely complimentary. Colden emphasized the workings of Iroquois governing and economic structures, comparing them positively (if somewhat romantically) to the ancient Romans. He intended his writings to convince British colonists to trade more with the Iroquois in competition with the French.

Léry—tended to view the possibility of Native American “salvation” by God with a strong degree of pessimism. The missionary impulse did not dominate their visions of America.

On the one hand, such attitudes could cause writers such as Léry to dramatize and reify the frightening otherness of Native Americans. After visiting the Tupinambas living near the Bay of Rio in Brazil in 1557, he recounted a nighttime ritual he had witnessed where men and women howled, leaped, and foamed at the mouth in a circular dance. He was certain they were irrevocably possessed by the devil. On the other hand, an ironic result of his absolute sense of Christians’ alienation from the “savages” was an analytical detachment that could lead to a new kind of ethnographic study and appreciation of Native American cultures for their own sake, given a lack of interest in altering those cultures along European, Christian lines. Léry wrote lengthy positive descriptions of Native American social and political structures and customs. Interestingly, his discussion of cannibalism was more of a polemical attack on Roman Catholic Eucharistic theology and on the cruelty he witnessed against other Huguenots in France during the St. Bartholomew’s Day Massacre of 1571.

By the seventeenth century, many European writers, including the Catholic essayist Michel de Montaigne, contrasted positive images of Native Americans with European problems such as sectarian warfare, commercial greed, and social conflict. Frightening depictions of howling, naked, nomadic, and cannibalistic “savages” who lacked the goods of “civilization” often gave way to romanticized images of “noble savages.” Native Americans were valorized for their supposed nakedness and “natural” way of life; their lack of private property, commercialism, and class conflict; and their freedom from many of the forms of militaristic violence and social disorder known in Europe.

Romanticized visions of America and its inhabitants had existed from the beginning of European exploration and conquest but evolved over time in diverse European discourses. Such images existed alongside many demeaning views that justified conquest and slavery, including evolving scientific theories regarding the inferiority of Native Americans. In the early period of

colonization, climactic, geographical, and astrological theories of human difference, based on the writings of ancient thinkers such as Galen, Hippocrates, Aristotle, and Pliny, dominated the discussion. In the eighteenth century, modern, biological, and genetic theories of racial difference contributed to vigorous forms of racism. The history of European science, along with traditions of philosophy, religion, and literature, figures prominently in the story of changing European visions of America. The diversity of these visions, so closely bound up with the economic, political, and cultural history of imperialism, colonial resistance, and postcolonialism, continues to play a dynamic role in scholarly understandings of early modern encounters between Europeans and Native Americans.

Early Modern English Accounts of the Irish

As had been true in the twelfth century, early modern English historical and literary accounts of Ireland effectively rationalized the conquest and settlement of Ireland in the sixteenth and seventeenth centuries, extolling the innate supremacy of English culture and civilization in sharp contrast to their critical portrayals of the primitive society, customs, religion, and laws of the Irish.

The Tudor expeditions into Ireland (1534–1603) sought to extend England’s dominion and

hence English common law, culture, language, central government, and religion over all of Ireland. England's rule had previously been restricted to lordship of the English Pale on the basis of earlier Anglo-Norman conquests; this was the fortified area of English rule around Dublin, composed of the four medieval counties of Dublin, Kildare, Louth, and Meath.

Crown plantations soon sprang up in Munster and Ulster in the latter half of the sixteenth century and became the norm under James I, though subsequent private settlements proved the most profitable. These Elizabethan and Jacobean settlers from the mid-sixteenth century onward have been termed the "New English" by scholars to distinguish them from the "Old English," or descendants of the earlier Anglo-Norman settlers, many of whom had come to identify with the culture of Gaelic Ireland.

Plantations were envisioned, in the Roman imperial tradition, as having a number of productive functions along economic and military lines as well as model communities of English culture and the Protestant religion among the wild Irish. The Tudor and Stuart experiments in Irish plantations have been seen by some modern historians (notably Nicholas Canny) as early models of English colonies in America.

The contemporary accounts of English writers such as Edmund Campion, Sir John Davies, Edmund Spenser, and Barnabe Rich are widely seen by scholars as attempts to justify and give moral and legal weight to the English conquest and colonization of Ireland, much in the tradition of Gerald of Wales's polemical twelfth-century accounts. Accordingly, these works inevitably draw a contrast between the cultured civility of Englishmen, who were faithful subjects of the Crown and able to speak and understand the English tongue, and the primitive, backwards, and rude Irish and their deplorable way of life. In this portrait of the evils of Ireland, a genuine agenda toward the reformation of Ireland and Irish culture, religion, and society may arguably be seen as a motive for such compositions prior to circa 1580. Canny, however, has criticized the contention that these theories of reformation and conquest and colonization are binary opposites.

Sir John Davies (1569–1626) and Edmund Spenser (ca. 1552–1599) in particular may be

Edmund Spenser, sixteenth-century English writer.
(Jupiterimages)

considered typical of the type of New English settler in and English mind-set on Ireland common at this time, according to Adawy Peart. The writings of Sir John Davies on Ireland are distinguished by their self-congratulatory tone and overconfident narrative of the successful implementation of English common law in Stuart Ireland. A court poet and later the solicitor general and ultimately the attorney general for Ireland under James I, Davies, who was instrumental in the founding of the Munster plantation, penned *Discovery of the True Causes Why Ireland Was Never Entirely Subdued* (1612) and *Reports* (1615). Edmund Spenser was both a renowned English Renaissance poet and a New English Munster planter and is best known for his *The Faerie Queen* (1590–1596) and also for his *A View of the Present State of Ireland* (1596). The first of these, a verse epic, has been seen as an allegorical plea for more heavy-handed governmental policies in Ireland. Spenser's *A View of the Present State of Ireland* takes the form of a conversation between two Englishmen in which the more well-informed of the two expounds first on the failures of the Old English in Ireland

➤ A NEW DESCRIPTION OF IRELAND

Barnabe Rich (ca. 1540–1617) was an English soldier who rose to the rank of captain and served during the colonization of Ireland. He was also the author of numerous works, several of which Shakespeare relied on as sources. In his *A New Description of Ireland* (1610), he blamed most Irish vices on the inhabitants' Catholicism:

"Now to speak of their dispositions, whereunto they are addicted and inclined: I say, besides they are rude, uncleanly, and uncivil, so they are very cruel, bloody-minded, apt and ready to commit any kind of mischief. I do not impute this so much to their natural inclination as I do to their education that are trained up in treason, in rebellion, in theft, in robbery, in superstition, in idolatry, and nuzzled from their cradles in the very puddle of popery. This is the fruits of the Pope's doctrine that doth preach cruelty, that doth admit of murders and bloody executions. By poisoning, stabbing, or by any other manner of practice howsoever, the Pope teacheth subjects to resist, to mutiny, and to rebel against their princes. From hence it proceedeth that the Irish

have ever been, and still are, desirous to shake off the English government. From hence it doth proceed that the Irish cannot endure to love the English because they differ so much in religion. . . . [F]rom hence it is that the Irish had rather still retain themselves in their sluttishness, in their uncleanness, in their rudeness, and in their inhuman loathsomeness, than they would take any example from the English, either of civility, humanity, or any manner of decency. . . . God bring it once to pass that we might all join together, as well English as Irish, in the true acknowledgment of one God, of one religion, of one King, of one law, and of one love."

(including the unsuccessful application of English common law) and details the evils of Irish law, custom, culture, and society, ultimately proposing a forceful martial policy to conquer Ireland fully.

With English successes and the rise of the plantations from 1550 on, the penal laws and other legislation and governmental policies saw usage of the English language and culture expand substantially. The Irish Gaelic language thus suffered losses in cultural prestige, literary status, and usage in the years that followed the Tudor conquest of Ireland. A long period of language decline followed. The Act of Union of 1800 confirmed the superiority of the English language, as did English-medium national schools. The high mortality rate of Irish speakers during the years of the Great Famine and successive waves of immigration likewise further weakened the state of the language. It was only in the last century (1922) that Irish became an official language in Ireland, and substantial

and successful efforts have been made to ensure its preservation.

Vespucci's World—Europe Imagines America

The publication of Amerigo Vespucci's *Mundus Novus* in 1504 contributed to the improvement of

the European understanding of world geography. This document was a letter in which he described the South American coast of Brazil and the River Plate, which he discovered during his 1501 journey as an explorer for the Portuguese king Manuel. In fact, in his letter Vespucci proclaimed the existence of a “new world.” He claimed that the territories encountered by Christopher Columbus in 1492 were not part of Asia. On the contrary, they constituted a new continent that contained many different peoples, plants and animals, all of them unknown to Europeans.

This new discovery sparked the imagination of the Europeans, who began attributing fantasy to this new world. They used ancient authors such as Pliny and Herodotus and medieval texts such as Marco Polo’s and Mandeville’s travel accounts in order to explain the radical novelty created by the enlargement of the world. For historians, it was a crucial intellectual process related to the incorporation of the new world in the minds of the Europeans. Its principal consequence was the definition of the American territories as an other.

The European representation of America was related to the challenging situation created by Columbus’s encounter with Guanahaní, the Caribbean island where his ships arrived in 1492. The native inhabitants, plants, and animals found by him were not included in the traditional geographical, natural, and theological knowledge possessed by the Europeans. The Bible, for instance, did not mention this new land or its inhabitants. Asia and Africa had been known to Europeans from antiquity, but America was not. Consequently, it was a new world whose representation was built during its exploration and conquest by the Europeans starting in the late fifteenth century. As a result, exploration and conquest were two crucial historical processes that formed the modalities adopted by the Europeans to produce an image about America.

The first modality is connected with the oral and written description produced by officials, explorers, and merchants who traveled to the new world. They produced an exhaustive inventory of the American natural resources, which were considered as possible commodities to be commercialized in Europe. But in many cases these natural objects were not included in the

➤ DE LAS CASAS AND THE DEBATES WITH SEPÚLVEDA

During the sixteenth century after the Columbian contact with the New World’s peoples, the Europeans were uncertain about the full humanity of Native Americans. In Spain this issue was discussed by theologians, priests, lawyers, and officials who had participated in the conquest of the New World. The discussion about the nature of the indigenous peoples emerged in particular during the dispute between the Dominican priest Bartolomé de Las Casas and the humanist Juan Ginés de Sepúlveda in Valladolid in 1550–1551.

For Las Casas, who founded his ideas from his personal experience in the New World as a soldier and priest, the Native Americans were fully rational beings capable of living in society and receiving the gospel. Sepúlveda, on the contrary, who followed the Aristotelian theory of natural slavery, believed that they were idolaters and cannibals. In other words, they were barbarous because they did not have the nobility and piety of the Spaniards.

If the Native Americans were human beings, then they were subjects of the Spanish king, but if they were not human beings, they were slaves without rights. De Las Casas and Sepúlveda were divided about the nature of the indigenous peoples and their capacity to live under Spanish law and the Catholic religion, both fundamental elements for establishing the rights of Native Americans.

—*Marcelo Fabián Figueroa*

European natural history texts. As a consequence, plants, animals, and even human beings were explained through comparison with the European world. For example, vegetables and plants were defined as native varieties of Eastern cinnamon and pepper.

The second modality is connected with the explanation of the overseas lands through the use of the notions given by the classical and Christian texts, which were taken as a conceptual framework in which to put the data found in the new world. The notions of paradise and a golden age were adopted to illustrate the simplicity of Native American society, on one hand, and the exuberant nature observed in the Caribbean and Brazilian coasts, on the other hand.

The above-mentioned modalities were connected with the material and symbolic European appropriation of America. Nevertheless, the existence of the “Indians,” as they called them, was the harder fact that the Europeans had to explain. The question of their humanity or degree thereof produced a debate during the sixteenth century. Beyond their curious clothes, habits, physiognomy, etc., the crucial question was, were the Indians human beings or beasts?

The answers formulated were founded in the traditional notions given by the classical and Christian thinkers: Native Americans could either be defined in Aristotelian terms as barbarous because they were without cities, laws, and political institutions, or they could be defined in Christian terms as incapable of receiving the gospel. This is the key question discussed by the Dominican priest Bartolomé de Las Casas and the humanist Juan Ginés de Sepúlveda in Spain in 1550–1551. The questioned capacity of the Native Americans to receive the Christian faith was crucial, because this faculty for conversion was one of the most important foundations of the legitimate European occupation of America.

The images created by the Europeans about America were a consequence of the political, economical, and intellectual processes linked with European overseas expansion and the configuration of early colonial empires. Consequently, these perceptions were the most tangible outcome of the territorial occupation developed by Spain, Portugal, France, Britain, and Holland in the early modern times as well as evidence about the history of the European relations with the peoples located beyond Europe.

Mesamerican Responses to the Spanish Encounter

The fall of Tenochtitlan, the capital city of the powerful Nuhua (Aztec) empire, at the hands of the Spanish army in 1521 signified a transformation of native institutions, customs, and religion for the indigenous groups of Mesoamerica. This shift in power was naturally met by varying degrees of assimilation, resistance, and indifference by both Spanish and native groups. Nevertheless, it was the native peoples throughout Mesoamerica who were forced to adhere to new sets of rules that aimed to dismantle traditional ritual practices. At the same time, existing socio-political structures were combined with Spanish administrative practices in order to control the newly conquered lands and to further Spanish economic interests. These changes triggered a number of responses that shaped colonial society.

The military conquest was immediately followed by an effort to convert natives to Christianity. The sole basis for the legitimacy of Spanish dominion in the New World was the introduction of Catholicism and the elimination of pagan worship. In order to accomplish this goal, Franciscan, Dominican, Augustian, and later Jesuit mendicant orders arrived from Spain and other parts of Europe during the early-sixteenth century to convert the indigenous of America. Spanish accounts of early evangelization emphasized the readiness of Indian groups to accept Christianity. Franciscan chroniclers in particular make mention of the baptism of thousands of Indians, their willingness to attend mass, and their support of the missionary enterprise. Yet local groups understood this process very differently.

For indigenous societies who were accustomed to worshipping a number of deities, the acceptance of a new god did not mean that one had to abandon the old. The Nuhua, Otomí, Maya, Mixtec, Zapotec, Tecpaneca, and Tlaxcalteca of

➤ BERNARDINO DE SAHAGÚN

Recognized as a pioneer in early ethnography, Bernardino de Sahagún (1499–1590), a Franciscan missionary from Spain, left a rich corpus of material on the culture, religion, and language of the Nahuas (Aztecs) of central Mexico. Sahagún was trained in grammar, law, theology, and history at the University of Salamanca. He arrived in New Spain in 1529 and immersed himself in Nahua culture and society.

At the time of his arrival, Franciscan missionaries had been active in evangelizing the native peoples of the New World. For Sahagún, it was imperative to learn the ancient customs and language of the Aztecs in order to convey Christian concepts more clearly. He studied Nahuatl and wrote the *Vocabulario en tres lenguas*, a trilingual dictionary of Nahuatl, Latin, and Spanish to enable his brethren to teach the Indians in their native tongue. Sahagún enlisted the assistance of indigenous students educated by the Franciscans to conduct interviews with community elders and native elites. His major goal was to bring together information on Nahua religion, culture, and geography. The testimonies and pictorials he collected resulted in a twelve-volume work known as the *General History of Things of New Spain*.

The *General History* is regarded as a landmark study of Aztec society before the conquest. The compendium received significant resistance from ecclesiastical authorities during the early colonial

Aztec musicians playing instruments, from the Florentine Codex by Bernardino de Sahagún, sixteenth century. (Bettmann/Corbis)

period as they believed it promoted pagan ritual. The work resurfaced during the nineteenth century among Mexican scholars who wished to emphasize the importance of Aztec civilization in the creation of a national identity.

—Alexander Hidalgo

central and southern Mexico added the Christian God to their existing pantheons. Nevertheless, they continued to venerate the ancient deities. Both secular and religious Spanish authorities understood this as a continuation of pagan practices and further determined to extirpate idolatrous practices. Indigenous communities responded by transferring ritual devotion from the public to the private sphere. No longer were traditional religious ceremonies celebrated out in the open. Instead, those who continued to worship “idols” did so at home, away from prying eyes. Mountains and caves, natural elements that represented a direct connection between the sacred forces and humanity, were used as

ceremonial sites to renew traditional beliefs. The burning of incense and copal, and sacrificial offerings of small birds and animals remained in practice throughout the colonial period. Despite numerous attempts by religious authorities to eliminate pagan rituals, indigenous groups continued to venerate their ancient deities during the sixteenth century.

The introduction of Christianity also affected the social dynamics of indigenous communities and how they responded to change. Traditionally structured along strict caste lines, villages vested political authority in native elites who were able to maintain a central base of power even after the Spanish conquest. Yet with

the advent of Christianity, ideals of egalitarianism infiltrated the ranks of indigenous society. Commoners, or *macehuales*, often found favor from clerics who enlisted their help in administering daily church activities. From their new positions of power, macehuales challenged elite authority and sought to advance their interests within the shifting social hierarchy. This dynamic often divided communities into factions. In addition, elite offspring were often educated by Spanish missionaries. Children, mostly males, were taught to detest traditional religious celebrations and practices such as drinking and polygamy. These efforts drove a wedge into the social relations of native communities that threatened the destruction of traditional roles. Yet an analysis of indigenous societies after the initial phase of evangelization suggests that communities found ways to negotiate the changes that resulted from Spanish intrusion and to rebuild existing structures.

Along with changes in religion and the internal restructuring of their communities, indigenous groups also contended with high taxation, labor drafts, and land usurpation. Both the Crown and ecclesiastical authorities demanded payment in-kind or in-specie at regular intervals during the year. Individual Spaniards who were awarded an *encomienda*, or labor consignments from local Indian towns, exacted their privileges indiscriminately. At the same time, the appropriation of indigenous land by Spaniards reduced traditional community space which negatively affected their ability to produce crops for internal consumption. In response, native villages learned to effectively use the Spanish legal system. Indigenous communities in central Mexico became active litigators in the Spanish courts and often succeeded in maintaining control of communal lands and in receiving *reducciones*, or tax exemptions, from Spanish administrators.

Alexander von Humboldt, *Political Essay on the Kingdom of New Spain*

From 1799 to 1804, Alexander von Humboldt (1769–1859), a Prussian scientist, and Aimé Bonpland (1773–1858), a French naturalist, made extensive original explorations in New Spain. With authorization from the Spanish Crown, they traveled through Venezuela, Colombia, Ecuador, Peru, Mexico, and Cuba. They also visited the United States. From these travels, Humboldt published over the next two decades more than two dozen volumes of original geographic observations and scientific discoveries. The originality of his work was based on its minute examination of a wide range of natural phenomena, integrating them into a systematic whole. These insights had a great influence on the young Charles Darwin, whose theory of evolution revolutionized Western science.

Among Humboldt's pioneering writing was the three-volume *Essai politique sur le royaume de la Nouvelle-Espagne (Political Essay on the Kingdom of New Spain)*. Published in Paris, where Humboldt was then living, the work appeared in two large volumes between 1808 and 1811 and then as five smaller volumes in 1811. An English translation was published the same year.

In Humboldt's day, the viceroyalty of New Spain, with its capital in Mexico City, consisted of Mexico, areas of Central America and the Caribbean, and the United States from Texas to California. Humboldt approached his examination of New Spain in terms of its physical, economic, and human geography, successively describing the terrain and climate of the region; its agriculture, business, and trade; the population; social

Alexander von Humboldt, renowned naturalist and scientific traveler. Humboldt's inland trek through the heart of the South American continent at the turn of the nineteenth century set the standard for explorer-scientists of the time. (Jupiterimages)

organization; the public health system; and administration and defense of the realm. Tables of statistics appear throughout the work.

The wealth of New Spain was based on mining resources, especially silver. It was the need to know more about the mines and mineral districts of New Spain that prompted the writing of the *Essay*. The value of the work was vastly enhanced through Humboldt's incorporation of a multivolume atlas, providing numerous original maps and a countrywide (Pacific Ocean to Gulf of Mexico) silhouette of the rising and falling mountainous profile of Mexico. Humboldt was uniquely qualified to write the *Essay*. He had traveled and researched throughout New Spain, taking extensive detailed notes. He had exceptionally wide access to archives in Spain and Mexico City. Moreover, he found the capital city, with its School of Mines, Botanical Gardens,

THE HUMBOLDT CURRENT

While the scientist Alexander von Humboldt was exploring the coast of Peru from 1799 to 1804, one of the most striking phenomena that he observed was the extraordinary aridity of the area. He wanted to know what caused this extreme scarcity of rainfall. Humboldt had observed that a broad current of cold water ran along the coast toward the equator. This stream cooled the air along the coast from southern Ecuador to northern Chile, suppressing the conditions for ample rainfall and allowing only the development of cloud, fog, and mist (*garúa*). This coastal ocean phenomenon came to be termed the "Humboldt Current" or "Peru Current."

—Edward A. Riedinger

and Academy of Painting and Sculpture, to be the most advanced scientific and cultural center in the Western Hemisphere, providing him access to advanced expertise.

Humboldt was most struck by the extreme inequality of Mexico's population. The vast indigenous majority of its people lived in extreme poverty. A tiny white minority dominated the realm, divided between those born in Spain and those born in the Americas. The former, the Chapetones or Gachupines, dominated and were thoroughly resented by the latter, the subordinate Criollos. Humboldt's wide grasp of the physical and human aspects of social organization demonstrate his character as both an exceptional naturalist and as a humane scientist.

Black African Visions of Colonial American Society

The manner in which black Africans viewed the society of English North America depended upon both time and space. The first Africans arrived in colonial Virginia in 1619 after being exchanged for supplies with a Dutch ship. These first 22 Africans were not slaves but rather were indentured servants. After their acculturation to this new strange land and fulfillment of their indenture (normally five to seven years), these early black Africans set about making a life for themselves; some, able to obtain land, became tobacco planters.

These early African Americans experienced a large degree of interaction with their English counterparts. Hence, during this period they tended to adopt many English forms of manners and culture. This relative openness for African servants began to change over the course of time, thereby changing relations between both groups. A case in point is the 1640 sentence of black African indentured servant John Punch, who had run away from his master along with two white indentured servants. While the white servants merely had their service period extended (along

with some lashes from a whip), Punch was sentenced to “servitude for life.” In 1641 Massachusetts became the first colony to legalize slavery, and in succession over the span of the late seventeenth century the remainder of English North America followed this precedent. (Georgia was the last colony to adopt slavery during the early eighteenth century.) This development coincided with increasing demand for tobacco (both in England and in greater Europe) and the need to feed England’s Caribbean slaves with rice (the Carolinas became a primary producer).

Newly arrived black Africans naturally found their new status and surroundings disconcerting at best. Africans who had already endured at least a generation or so of slavery became agents of acculturation to the more recent arrivals. Many of these acculturated blacks had adopted the prevailing culture of their masters, depending upon their occupation and residence.

The expansion of plantation agriculture (especially during the late seventeenth century and the course of the following century) meant an ever-increasing number of new African arrivals who took a much longer time to acculturate to the society and culture of English colonial America.

➤ A DUEL OF LIVES—ANTHONY JOHNSON AND OLAUDAH EQUIANO

It appears that Anthony Johnson arrived in colonial Virginia in 1621. He was listed on the ship manifest as “Antonio a Negro.” By then, tobacco cultivation had taken hold as the main export product of the colony. Anthony clearly did not foresee the impact that skin color would play in his life or among blacks throughout colonial English America. However, it is evident that Anthony Johnson (in his early years in Virginia he was a servant) by 1645 was a man of wealth and prospered through the labor of his indentured servants. Anthony along with his wife Mary and their children moved to Maryland, where they purchased 300 acres (120 hectares). Anthony died on this plantation in the spring of 1670. While both his son and grandson prospered reasonably well, this was nonetheless behind the backdrop of

the expansion of chattel slavery in colonial America.

Olaudah Equiano’s experience was much different from that of Anthony Johnson. Equiano lived between 1745 and 1797, authoring along the way one of the important narratives about slavery in colonial North America. His saga began with his capture and then transport initially to Barbados via the infamous Middle Passage. He was fortunate to have survived, given the deplorable conditions on slave ships. In Barbados and then later in mainland America he experienced the cruelty of plantation slavery, being treated as if he were a beast of burden. His vision of colonial America, unlike that of Anthony Johnson, was one of endless oppression and degradation.

—John S. Leiby

Proximity to whites played a role in how black Africans viewed the colonial setting. In this regard, space helped to dictate their orientation. Blacks who resided in urban settings or on small farms assimilated to a greater degree to the prevailing colonial culture than those residing on large plantations.

When slavery began to expand during the late seventeenth century (within the tobacco-producing regions in particular), landowners sought a workforce they could employ to the limits of its productive capacity. This resulted in increased tension between landowners and their laborers. Narratives of the period are replete with complaints from landowners about the laziness of indentured servants. At first, white landowners tried to get as much labor and goods from their slaves as possible. Nevertheless, over time many slave masters compromised on the pace and duration of work. These compromises, however, did not prevent slaves from passively resisting through malingering and stalling tactics. Indeed, black slaves on the plantations of the Chesapeake and the lower South, to a large degree, dictated the pace and manner of production.

In contrast, urban blacks became far more acculturated to colonial American society as compared to those living in the countryside. Many urban masters hired out their slaves, as in major cities like New York, Philadelphia, and Charleston, among others. It was within the confines of these urban spaces that many blacks became highly skilled in such specialized trades as blacksmiths, tanners, carpenters, barbers, and other occupations.

Newly arrived Africans who ended up living on plantations did not assimilate as quickly as those blacks who lived in closer proximity with whites in urban areas or on small farms. Plantation slaves along with the newer arrivals retained a larger degree of their African cultural heritage

and consequently viewed colonial America as an alien environment to a significant degree. Assimilated black Africans, especially from the northern colonies, typically embraced the prevailing English culture and appreciated their relative freedom of movement. Yet below the surface all slaves yearned to be free. The family under slavery became a cornerstone of black society within the colonies, although black men by custom and because of slavery did not reside with their wives in the same percentage as their white counterparts. Some black Africans in colonial North America seemingly accepted their lower status but looked to eventual freedom. However, many slaves also resisted either in a passive or more active manner (through violence). In the latter category, the Chesapeake Rebellion (1730) and the Stono Rebellion (1739) were among the most notable of the colonial era. However, the most readily available forms of resistance for the majority of slaves were slowing down the pace of work, destroying crops, and sabotaging plantation and farm tools. Many enslaved people resisted by running away, which meant, if they succeeded, that they posed a serious financial loss to their masters.

■ Introduction: Global Religious Movements—New Wine in Old Bottles

The early modern period was marked by the spread of already-established religions, particularly Christianity and Islam. Both of these major religions, as well as others, also fragmented with the Protestant Reformation in Christendom and the establishment of Shia Islam in Safavid Persia. Christianity and Islam took on new characteristics as they were adopted by new societies, and resistance to their spread also affected religious life.

The global expansion of Christianity was in large part due to the global expansion of European states. The leader in this expansion was Roman Catholicism, the religion of the nations

that led this expansion, Spain and Portugal. Catholicism in this period became the first truly global religion, with a presence in every inhabited continent except Australia, and the Catholic Church was the first global institution. Catholicism was adapted to numerous cultures, from the ancient literary civilization of imperial China to the hunter-gatherer economies of indigenous North Americans to the African monarchy of Kongo. Sometimes Catholicism came with the sword, as in Mesoamerica, but it was also often reliant on the persuasive abilities of its missionaries and whatever spiritual or material advantages they could offer.

MAJOR RELIGIONS IN EASTERN HEMISPHERE, 1500

Protestant Christianity, which originated in the early sixteenth century, also expanded through the early modern period but much more slowly. Its principal triumph was in the British colonies of North America, where despite the difficulty of converting Native Americans, colonists established numerous societies espousing different varieties of Protestantism, including Puritan Congregationalism in New England, Quakerism in Pennsylvania, and Anglicanism in the southern colonies.

Islam grew more slowly and peacefully than Christianity. Muslim traders, warriors, and Sufi orders spread the message of the Quran throughout Africa and Eurasia. The early modern Islamic umma, or community of believers, would stretch from parts of Hungary in the far north of the Ottoman empire to the coasts of western and eastern Africa to Indonesia and central Asia. The conflict between Christians and Muslims also became global, with conflict everywhere from the Philippines to Ethiopia to Morocco and central Asia.

Muslims entered the Americas only as African slaves, and Islam did not establish itself as an American religion. Muslim Africans, like their animist and Christian fellows, would face a religious revolution imposed by their Christian masters. But aspects of indigenous African religion would remain an important part of the culture of many African American societies, often being adapted into new religious and magical systems known as “conjure.”

Other religions changed as well. The Neo-Confucianism of Zhu Xi became the official ideology of the Chinese state in the Ming and Qing dynasties, enforced through the examination system, only to be challenged by the individualist “School of Wang Yangming.” Confucianism was also the official religion of Japan’s Tokugawa state, although attendance at Buddhist shrines was enforced on the Japanese population as an anti-Christian measure. Buddhism also changed, with the rise of the Yellow Hat sect of Tibetan Buddhism, the foundation of the line of Dalai Lamas that has continued to the present day. A new religion, Sikhism, emerged in India, drawing on both Hindu and Islamic elements.

—William E. Burns

Thought and Religion during the Expansion of Islam in West Africa

Between 1450 and 1750 CE, Muslim merchant-clerics and Sufi missionaries spread Islamic thought and religion in the West African Sudan. Since making early inroads beginning around the eighth century, Islam had gradually spread from North Africa across the Sahara. After 1450 CE, the incorporation of Muslim heritage into local oral traditions and the transmission of systems of language and learning reflect Islam’s increasing importance in identity and politics of the region. The era also marks the Africanization of Islam through the cultural assimilation of new values into existing networks of power.

The ruler Sunni Ali Bar (1464/1465–1492) seized an opportunity to take advantage of weakening Mali imperial forces by conquering the major urban trade and intellectual centers of Jenne and Timbuktu. While Sunni Ali was an avowed Muslim, he also retained African beliefs, including legitimizing claims of supernatural powers (that he could turn himself into a vulture and make his armies invisible to enemies), much as his Ottoman contemporary emperors would make. After his death the Askia dynasty (1492–1592) was installed, and the Songhai empire reached its zenith. The establishment of large communities of traveling scholars helped deepen the philosophical and cultural impact of Islam in urban centers, where Islamic schools of learning flourished. By the sixteenth century, the majority of Islamic scholars in Timbuktu were of Sudanese origin.

The orthodox Sunni Muslim faith had spread across North Africa from Egypt. Cairo became an important center of learning during the Mamluk dynasty (1250–1517 CE). Pilgrims from West Africa stopped in Cairo, where they interacted with scholars and artisans, many of whom were imported to the centers of Timbuktu, Jenne, Bornu, and Hausaland. When the Ottomans conquered North Africa in 1517, their influence in West Africa waned except in the state of Borno-Kanem near Lake Chad. A hostel for the African students and travelers continued to operate in Cairo. In the meantime, a powerful and independent Moroccan state led

THE AFRICAN SCHOLARSHIP OF WAR AND DIPLOMACY AT TIMBUKTU

The spread of Islam by armies also brought literacy and learning to West African urban centers after the fifteenth century. West African scholars authored a large number of important histories of local conflicts and emerging states. Mahmud Kati, the author of *Tarikh al-Fattash* (History of the Seeker of Knowledge), was a member of the Songhai emperor Askia Muhammad's royal court. Kati recorded the great deeds of his patron with an understanding that surpassed any subsequent chronicler but also translated oral traditions into written works that placed the rise of the great empire into a larger regional history. Kati's extensive library of books and manuscripts survives in Timbuktu, where it is looked after by his descendants.

Other African scholars provided firsthand accounts of the end of empires, including the demise of Songhai with the Moroccan capture of Timbuktu. Moroccans actually seized the renowned scholar Ahmad Baba and sent him into exile in chains. The scholar Abd al-Rahman as-Sadi (1596–1655) was born five years after the invasion but recalled the events that followed the traumatic conflict. In his *Tarikh al-Sudan*, he describes seeing “the ruin of learning and its utter collapse” under the Moroccans. Living through this history inspired Abd al Rahman as-Sadi to write in Arabic about the ancestors and heroes of the Songhai in his famous *tarikh*, a testimony to his rootedness in both the local and global reaches of the Islamic world.

—Candice Goucher

an invasion of Songhai in 1571. Although Morocco interfered in West Africa throughout the next century, the political turmoil also allowed greater independence and localized forms of Islamic thought and culture to evolve.

Timbuktu was one of several centers of learning in West Africa, and there were 150 schools in that city alone. Translators, doctors, jurists, and merchants selling manuscripts and books were encouraged by the city's wealthy patrons. The writer known as Leo Africanus noted the book trade to be among the most lucrative commercial ventures. The eighteenth-century spread of Islam through conquest was accompanied by a much greater awareness of *sharia*, the principles of Islamic law. In Borno the Kanuri language flourished, and the city's written records document the development of religious thought. Hausa became a lingua franca of the Sudan and northern forest regions, where it borrowed heavily from Arabic. The leading Muslims from Kano to Gao and Takrur were well known throughout North Africa and West Asia, suggesting an intellectual cohesion. Despite the changing political regimes, market towns remained the chief points of dissemination for African Islamic studies.

Literacy increased dramatically during the period between 1450 and 1750, extending the influence of the Arabic language across the

region's commercial arteries. The Quran was not translated, but rather people were required to learn its passages through recitation and memorization. The ability to write script was considered magical in many settings, and the written words in the form of prayers and sayings entered West African oral and visual traditions. Small verses inscribed on paper were enclosed in protective amulets; prayers, sayings, and geometric designs were traded on dyed and embroidered cloth and leather objects, carved wooden boards and furniture, and engraved copper-alloy basins and swords. All were carried far beyond the reach of schools and libraries to smaller pre-literate communities.

In the seventeenth century, Islamic ideas of reform shaped a number of social and political movements. The jihads in the Senegambia region began in the 1690s and resulted in the establishment of small but powerful Muslim-dominated states into the early eighteenth century. The states of Futa Jallon and Futa Toro used democratic principles to establish elected councils of elders to speak on behalf of ordinary people. The Muslim revival eventually spread eastward in the eighteenth century. The reformist philosophy also inspired important histories of the western Sudan. Two key works by Timbuktu scholars were the *Tarikh al-Sudan* (History of the Sudan) and the *Tarikh al-Fattash* (History of the

Seeker of Knowledge), completed about 1665. These works relied on oral traditions and helped to integrate the African past with contemporary Islamic thought. This intellectual unity would aid the spread of jihads as well as support the resistance against European incursions in the second half of the eighteenth century.

The Coming of Christianity to the Kongo

The Kongo, an African kingdom in west-central Africa, had the most contact with the Portuguese before the seventeenth century. At its apex, the kingdom encompassed modern-day northern Cabinda, Angola, the Republic of the Congo, and the western portion of the Democratic Republic of the Congo. The Portuguese first developed contacts with the Kongolese after 1483 and soon sought to utilize the region as a base for the early transatlantic slave trade. At the same time, Portuguese missionaries did try to bring Christianity to all the Africans they encountered but were most successful with the people of the Kongo.

When the Portuguese first arrived in the Kongo, Nzinga Kuwu was the king. He welcomed the arrival of the foreigners and, in return, sent an embassy to Lisbon. In 1491 the Portuguese sent a large expedition to the Kongo, one that consisted of explorers, artisans, and missionaries. The missionaries achieved a major victory: Nzinga Kuwu was baptized and given the name João I. However, he eventually returned to the native religion of the Kongo, one that worshipped ancestral gods. A civil war soon erupted after his death in 1506 between his sons Mpanzu a Kitia and Afonso (who took this name after being baptized a Christian). Afonso eventually took the throne in 1509, and

from here he was able to begin pushing his Christian agenda.

For the Portuguese missionaries, Christianization meant more than a religious transformation; it meant a societal one as well. However, Afonso sought to utilize Kongolose societal organizations and merge them with Portuguese ideas. For example, according to the Kongolese, the monarch was the ancestral spokesman of the gods. Afonso endeavored to utilize and adapt this idea so that it would have a Christian rather than a native basis. In addition, he studied Portuguese law and changed the etiquette at court to one that was more similar to the Portuguese one. For instance, he called the provincial governors “dukes,” and the military leaders and court officials became “counts” and “marquises.”

In addition, the Christianity that Afonso pushed developed a uniquely African perspective. The traditional religion practiced by the Kongolese was one that revered two sorts of spirits: one type is based on location and the other on ancestral spirits. One of his first acts was to destroy the temple that housed all of their national deities, what they called the “house of idols” in the capital, Mbanza Kongo. He built a church over the ruins, which resulted in the term *nzo a ukisi* (“house of idols”), to be used for a Christian church. Afonso was determined to help the conversion of his people to Christianity from the top. In 1513 he took an oath of obedience to Pope Leo X.

The Christian religion spread quickly among local elites as they recognized that it was the route to royal favor. Even Afonso’s son, Henrique, was ordained as the first bishop of Bantu parentage in 1518. He had studied in Portugal for 15 years and returned to the Kongo in 1521. Afonso continued his mission of Christianizing the Kongo by opening a network of missionary schools all over the country by 1516. This was funded by a tithe, or a mandatory religious tax. As the kingdom of the Kongo grew in size and strength, the Christian religion spread with it in the form of its missionaries. Despite Afonso’s efforts and goals, Christianity never spread out past the elites by the time of his death in 1542.

Diogo I succeeded Afonso and not only continued the policies of his grandfather but he also expanded them. Diogo encouraged Jesuit activity

▶ LETTERS TO THE KING OF PORTUGAL ABOUT THE TRANSATLANTIC SLAVE TRADE, 1526

When the Portuguese arrived in the Kingdom of the Kongo in 1483, they brought with them more than just religion. They also brought the slave trade, which disrupted the balance of power and population of the local people. Afonso I became king of the Kongo in 1506, and he supported the Jesuit missionary work as a Christian. Yet he was disturbed by the effects of the slave trade on his kingdom. Although his people were not specifically targeted for enslavement, he did have problems controlling it, as often those subjects who set about capturing slaves from the surrounding areas were eager to deal directly with the Portuguese in order to avoid paying taxes. As a result, King Afonso wrote a series of letters to King João III in order to ask for his help.

“Sir, Your Highness should know how our Kingdom is being lost in so many ways that it is convenient to provide for the necessary remedy, since this is caused by the excessive freedom given by your agents and officials to the men and merchants who

are allowed to come to this Kingdom to set up shops with goods and many things which have been prohibited by us, and which they spread throughout our Kingdoms and Domains in such an abundance that many of our vassals, whom we had in obedience, do not comply because they have the things in greater abundance than we ourselves, and it was with these things that we had them content and subjected under our vassalage and jurisdiction, so it is doing a great harm not only to the service of God, but the security and peace of our Kingdoms and State as well . . . and so great, Sir, is the corruption and licentiousness that our country is being completely depopulated, and Your Highness should not agree with it nor accept it as in your service.”

—Monique Vallance

and even began sending out priests and chapel boys (ministers of noble birth) to convert the surrounding kingdoms. Thanks to all these efforts, Pope Leo X named the Kongo an Episcopal See in 1595, and the Church of São Salvador became a cathedral. By 1600 there were 13 parishes, each supported with teachers and offices and all supported with a combination of funding by the tithes and the king of Portugal. The results were shown by the dissemination of the religion outside of the noble class. People who lived in the cities and towns seemed to be knowledgeable about the liturgy of the Catholic Church, and masses were well attended. In the villages, people could at least recognize symbols such as the cross and rosary and sought to have their children baptized.

The successive years saw much civil unrest in the Kongo as the Portuguese tried to manipulate the different factions so that they could gain more political control and therefore more control over the slave trade. Although the Portuguese never formally took control of the Kongolese government, they did manage to maintain a certain amount of control over the kings, and

their continued influence as well as the continued devotion of the aristocracy meant that Christianity would remain an influential religion in central Africa.

Ethiopian Resistance to Muslim Encroachment

The conflict between the Ethiopian Solomonic dynasty (which derives its name from the mythological Jewish king of Jerusalem) and the Islamic

THE PORTUGUESE AND JESUIT FACTOR

While fighting against its Muslim neighbors, Ethiopia also clashed with its Christian allies. The myth of Prester John, a legendary Christian patriarch and king said to rule over a Christian nation lost amidst the Muslims and pagans in the Orient, was of great interest to the kings of Portugal from the time of Prince Henry the Navigator. In their quest for an alliance and trade with this imaginary ruler, the Portuguese soon established diplomatic relations with Ethiopia. Their ambassador, Peros da Covilha, reached Shewa in 1493. In 1509, the Byzantine empress Helena sent an Armenian, “Matthew,” back to Portugal as her ambassador. However, the desire to foster joint operations against Islam was to give way to misconceptions in Lisbon and Rome that the Ethiopian Church was anxious to accept papal jurisdiction. This led to a disastrous phase in Ethio-European relations, a legacy of which was the lack of trust between Ethiopians and foreigners for a long period. Close contacts with Portugal inevitably led to Jesuit missionary activity, which the ancient Ethiopian Orthodox Tewahedo Church

perceived as a threat. Theological disputes between the Jesuits and Ethiopian clergy, including a bitter dispute over whether Christ had one totally unified (Tewahedo) divine nature or two separate divine and human natures, resulted in protracted religious and political schism in the kingdom between 1606 and 1632. Emperors Za Dengel (Asnaf Sagad II 1603–1604) and Susenyos (1607–1632) were secretly converted to Catholicism, but under the rule of Emperor Fasiladas (1632–1667), the Jesuits fell out of favor and were expelled. Although the future of Ethiopian allegiance to Alexandria was secured, the Jesuit interim (1500–1633) continued to influence the course of Ethiopian history. Pedro Páez (1564–1622), the Jesuit missionary who was described as “gentle, learned, considerate,” was highly influential in facilitating the spiritual and intellectual engagement of Ethiopian rulers with Catholic traditions. Some of the Catholic churches he designed are still standing and were an influence on Ethiopian architecture.

—Alexander Mikaberidze

sultanates of the Horn of Africa coast is better understood by analyzing the different social and religious structures of the two regions. The Ethiopians were Christians (Copts), farmers of the plateau and lacking a clan structure, while the inhabitants of the sultanates were Muslims, herdsmen of the savanna and members of a clan organization that was inherited from the first Muslim traders of Egypt and southern Arabia.

At the beginning of the ninth century, Islam entered this region due to the geographical importance of the African coasts at the horn in order to use it as a maritime hub on the Silk Roads so they could reach the Indian subcontinent by ship. Nevertheless, this Muslim foray, at least until the beginning of the fourteenth century, focused on the coasts and not on the Ethiopian plateau. During this same period the diplomatic relationships between the kingdom of Ethiopia and the Ayyubid (1171–1250) and Mamluk (1250–1517) vizierate of Egypt were generally peaceable. The Muslim traders became useful for the farmers of the Solomonic kingdom because they

were able to trade their agricultural products to the Islamic sultanates and profit due to drought in those regions.

However, the situation changed quickly after the emergence of the Ottoman empire (1293–1922) and the decadence of the Mamluk vizierate in the fifteenth century. While the vizierate controlled the entire area, which ranged from north-eastern Africa to the Horn all the way to southern Arabia (Yemen), the relationship between the two was peaceful and well supported by the Mamluk, who continued to maintain a constant diplomatic and trade connection that was useful for both. The situation changed during the fifteenth century because of the aggressive military campaigns conducted against the Ethiopian border by the Islamic sultanates, which led the Ethiopians to upgrade their military.

The Ethiopian defensive ability was stronger than the offense of the sultanates, who were divided into many clans and were less organized and poorly equipped. During the reign of the *negus* (the title of the Ethiopian king)

Yeshaq (1414–1429), the Ethiopian military blasted against the Ifat and Adal sultanates, destroying mosques and replacing them with churches. The lack of control of the Mamluk sultanate in the Red Sea region and in the Horn of Africa in particular, allowed a power vacuum during the fifteenth century and permitted an Ethiopian military predominance in the region. Under the negus Zara Yacob (1434–1468) and Baeda Maryam (1468–1478), the Ethiopians continued to favor defensive-offensive campaigns against the sultanates, managing to occupy many areas that had previously been under Muslim control. However, the situation changed in the sixteenth century when the Ottomans began helping the Islamic states militarily. After he conquered Egypt and Yemen, Selim I (1465–1520) began to supply the Ethiopians with new firearm models and modern muskets. On the other side, the arrival of a Portuguese fleet at the end of the fifteenth century prompted the building of both economic and military relations between the Ethiopians and the Europeans, which played an important role in the following century.

With the invasion of Ahmed Ibrahim al-Ghazi, nicknamed Gagn (“the lefthanded”), the military predominance of the Ethiopians was surpassed by the Islamic dominions. Gagn was described as an incredible warrior and general (*emir*), and his conquest of Ethiopia was considered so destructive and violent that after 400 years the emperor Haile Selassie, the last of the Solomonic dynasty, would remember in his diary that when he was a restless child, family members threatened that they would call the legendary Gagn to kidnap him if he would not change his unruly behavior. Gagn’s skills were not only military but political as well. He had the dexterity to unify the divided Muslim reigns and the ability to gather more soldiers and to convince them to join a battalion of Turkish Janissaries. In 1529 Gagn was able to pacify interclan wars and start the invasion.

The Ethiopian emperor of this historical period was Lebna Dangel (1508–1540), who tried to stop the invasion by first sending a general who was defeated and beheaded. The main Ethiopian army was then annihilated in the Battle of Shimbra Kure in 1529. Two years later Gagn started a major campaign in the northern direction and,

after defeating three Abyssinian armies, invaded the Wollo region, the Mazaga and Gojjam, destroying all the villages, churches, monasteries he encountered.

At the end of 1535 Gagn controlled the entire Shoa, Duararo, Lasta, Bale, Damot, and Had-ya areas and a great part of Ahmara and Tigré areas, potentially the entire empire. The emperor Lebna Dangel took to hiding, sleeping in different places at night, for the peril of encountering the Muslim foe. Gagn’s main goal was to capture then kill the emperor and so indicate to the entire world the end of the Abyssinian Copt reign and dynasty.

Gagn kept small garrisons in all the places that were conquered to recruit new forces and to convert the local Christian inhabitants to Islam. Lebna Dengel requested the military support of the Portuguese, but the geographic distance between the Horn of Africa and the European state was too wide to be minimized in a short time; when a new Portuguese fleet reached Massawa in 1541 with 400 musketeers, Lebna Dengel had been dead for a year.

Galawdewos was 18 years old when he succeeded his father to the throne of Abyssinia; faith in this new chief and in the tiny Ethiopian army was completely non-existent. However, it was under the leadership of this negus that the Abyssinians were able to reverse the situation, even if with the help of the European armies. After an incredible victory against the Portuguese army in 1541, Ahmad Gagn made the only mistake of the entire invasion campaign: dismissing the Turks, except for a regular force of 200 Janissaries, and returning to his headquarters near Lake Tsana.

At the same time Galawdewos’s army was engaged in a war against the Muslims in the Wag-ara region. He killed the chief of that army, Seid Mehmud, and started to behave as Gagn had done before. Galawdewos destroyed the entire region, burning the Muslims’ houses, villages, and mosques. The Abyssinians began to rally to their king, and a force of 8,000 soldiers and 500 horses gathered in a short time. Meanwhile, the Portuguese rearmed themselves from a depot, which Christopher de Gama had prudently established near Debaroa, and his chemist, who had luckily escaped from the previous defeat, made

gunpowder from the sulfur and saltpeter that abounded locally. The Portuguese were able to reach Galawdewos's army during the third year of reign of the king of Abyssinia while Gagn was calmly encamped near Lake Tsana, quite unaware of the resurrection of this foe.

In 1543 Galawdewos and the Portuguese armies fought against Gagn's soldiers in the Battle of Uoina Dega on the north side of Lake Tsana. During the battle Gagn was killed by one of the Portuguese musketeers. With his death the Muslim army fell into confusion and was defeated. After the death of Gagn, the intensity of the religious wars in the Horn of Africa decreased, the Abyssinian empire was reestablished, and the Portuguese became the Ethiopians' most important allies. The Muslims of the coast were never able to invade the plateau until the Ogaden War in 1978 between Somalia and Ethiopia.

Neo-Confucianism in Ming/Qing Thought

Confucius (traditional dates 551/552–479 BCE) left behind an impressive legacy: Confucianism. This philosophy or, more accurately, way of living changed and developed in dramatic ways from the days of Confucius onward. Confucius emphasized tradition and study of a number of key central texts, which were later called Confucian Classics. The five texts that we call "The Five Classics" today are *The Book of Rituals (Liji)*, *The Book of History (Shangshu)*, *The Book of Changes (Yijing)*, *The Book of Poetry (Shijing)*, and *The Spring and Autumn Annals (Chunqiu zhuan)*. In Confucius's way of life, the central ideas of benevolence (*ren*), filial piety (*xiao*), and ritual, also translated as propriety (*li*), were important components that followers needed to incorporate into their lives.

Confucianism declined after the collapse of the Han dynasty (206 BCE–220 CE) and during

the long period of division in China (220–589) lost influence to Buddhism, which brought answers to questions about suffering and man's place in the universe. However, from the ninth century on a new form of Confucianism emerged: Neo-Confucianism. This revitalized Confucianism played a central role throughout East Asia. In China it corresponded with the rise of the examination system, by which aspiring men could earn a position in government. It also incorporated new strains of philosophy and intellectual development over the latter dynasties: the Ming (1368–1643) and Qing (1644–1911). In Japan it became the central philosophy by which the military governments ruled, and in Korea it also became the basis for serving in government.

The examination system was the most important factor in the centrality of Neo-Confucianism in China. Zhu Yuanzhang (1328–1398), the founder of the Ming dynasty, approved of Zhu Xi's (1130–1200) edition of the Four Books (*The Analects*, *The Book of Mencius*, *The Great Learning*, and *The Doctrine of the Mean*) and the Five Classics as the orthodox version to be learned. Every student in China, until the traditional exams were abolished in 1905, familiarized himself thoroughly with these texts.

Neo-Confucianism refers to a number of schools of thought. The two most important were the School of Principle (*lixue*) and the School of Heart-and-Mind (*xinxue*). The School of Principle was established during the Song dynasty, when the philosopher and scholar Zhu Xi synthesized the doctrines of earlier scholars and created the dynamics of their teaching. The School of Heart-and-Mind developed as a reaction to Zhu Xi's school, finding its most important expression in Wang Yangming (1472–1529).

One important set of ideas that Zhu Xi held are connected to cosmology. According to Zhu, the universe consists of a combination of *qi* (matter) and *li* (principle). *Li* is abstract, while *qi* is material,—or, if you like, *li* is the blueprint of a building, while *qi* is the stuff (bricks, windows, pipes) that make up the building. Beyond all things there is Taiji, the Grand Ultimate, which is a sort of super *li*. The goal of the student is to understand all of this by thorough study, or investigating objects until understanding the principle underlying all objects.

WANG YANGMING—ADAPTING CONFUCIAN THOUGHT IN THE MING DYNASTY

Confucian scholars are often considered conservative and unchanging. This is hardly the case when we consider a figure such as Wang Yang-ming (1472–1529), who was originally a follower of Zhu Xi. Wang's awakening to his own philosophy occurred when he tried to put into practice Zhu Xi's investigation of things (the technical term used in translating Zhu Xi's most important concept is *gewu*, which roughly means to study objects and ideas thoroughly). Wang did so by sitting in front of a bamboo plant and observing it for several days. Unfortunately, during this time he fainted and became very ill. He realized that this form of studying was not the best way to learn. Indeed, he came to the realization that learning was intuitive and internal and did not necessarily proceed through a rational process. Later in life Wang ran afoul of the emperor and was beaten, imprisoned, and exiled to a backward primitive region of China, inhabited by non-Han peoples. On the way there those hostile to him tried to have him assassinated. Wang once barely escaped by swimming across a river as would-be assassins pursued him. Nevertheless, he delighted in his exile and devoted himself to his learning. Afterward he was recalled to the capital and promoted. He became a prominent official whose duties included military ones. When one of the emperor's cousins rebelled and defeated government troops, Wang was put in charge of suppressing this rebellion. He did so successfully, leading his troops in battle and bringing the hapless rebel cousin as a prisoner to the emperor. Wang can be considered an ideal Confucian, a scholar who combined learning with practical problems of government administration. His philosophy and life have inspired the Chinese throughout their modern history.

—Ihor Pidhainy

Wang Yangming rejected this overly intellectual approach. Instead, he argued that li (principle) is within us and that all we need to do to investigate objects is to examine ourselves, for it is one's heart and mind that possess the Heavenly principle. In this way we can get to the principle of all things or objects. In addition,

Wang insisted on the unity of knowledge and action. This was in contrast to Zhu Xi's overly academic approach to learning.

Wang Yangming's writings made a strong impression on fellow scholars. Wang Gen (1483–1540), a follower of Wang, went about proclaiming the idea that all men are sages. Even more radical, Li Zhi (1527–1602) rejected all aspects of Confucianism as necessary to a well-ordered society. He argued that there is a childlike mind and heart that we lose because of civilization, and only through thoroughly following our selfish desires can we recover it.

During the Qing dynasty a third school developed, that of evidential learning. Its most important scholars included Gu Yanwu (1613–1682) and Dai Zhen (1723–1777). These scholars were concerned with getting back to the original meaning of the classics before they had been misinterpreted by Zhu and Wang. This school became important for its careful and painstaking scholarship in a wide array of disciplines, including history, philology, mathematics, phonology, and the like.

Although significant in the identity of the Ming and Qing dynasties, Neo-Confucianism came to be seen as a negative aspect of Chinese culture and identity. This idea, which had roots as early as the seventeenth century, became prominent during the nineteenth century, particularly after the Qing dynasty was defeated in the First Opium War (1840) and became dominated by Western imperial powers and then later by Japan. Chinese scholars rejected all aspects of Confucianism and particularly saw in Zhu Xi and the school of principles the main cause of Chinese backwardness during the nineteenth and twentieth centuries.

Neo-Confucian Ideology in Japan

Before the middle of the sixteenth century, Neo-Confucianism, which was formulated in thirteenth-century China, was confined in Japan to the Gozan temples of the Zen school of Buddhism in Kyoto. During this time, Neo-Confucian scholars were also Zen monks and priests. Japan did not have a scholar-official class as in China, and there was no connection between Neo-Confucianism and the ideology of the ruling elites in Japan. After 1550, during the wars of unification, some Zen monks began quitting their temples in favor of the pursuit of scholarship full-time. Thus, the separation of Buddhism and Neo-Confucianism had begun.

Some of these former Zen monks became advisers to the founder of the Tokugawa shogunate (1603–1867), Tokugawa Ieyasu (1543–1616). The most important of these scholars was Hayashi Razan (1583–1657), who was granted permission by the shogun to open a school of Neo-Confucianism in 1632, marking the start of the shogunate's support for Neo-Confucianism. Neo-Confucian ideas were appealing to samurai leaders for two main reasons. First, they provided them with a civilian political theory in a time of peace. In the final decades of the sixteenth century, warfare was nearly constant, and the samurai had little time or inclination to justify their territorial control in terms other than that of military power. This situation changed with the advent of peace and the subsequent establishment of

> HAYASHI RAZAN

The following passage is from Hayashi Razan (1583–1657), a former Zen monk and Neo-Confucian adviser to the shogunate. In addition to the Neo-Confucian opposition to Buddhism, its adherents were also critical of Daoism. In describing the essence of the Confucian Way (“the Way of the Sages”), Razan compares it with the Way as described in Daoism.

“Lao Tzu [Laozi] said: ‘The Way that can be told of is not an Unvarying Way.’ What he considered the Way was quiescence and nonstriving, and what he spoke of was the original undifferentiated state of nature. . . . The Way of the Sages is altogether different from this. Their Way consists in nothing else than the moral obligations between sovereign and subject, husband and wife, elder and younger brother, and friend and friend. . . . It is not what Lao Tzu called the Way. If one casts aside the moral obligations of man . . . then it is not the Confucian Way, it is not the Way of the Sages[.]”

the Tokugawa shogunate. Tokugawa leaders felt the need to justify their dominance over Japan to their vanquished foes, whose military power was largely still intact following the climactic Battle of Sekigahara (1600). Neo-Confucian ideals such as virtue and benevolence were therefore useful in crafting their political ideology. The second major reason for the Tokugawa adoption of Neo-Confucianism was its emphasis on hierarchy. Not surprisingly, Tokugawa leaders adopted an official system of four social classes during the seventeenth century, with the samurai on top followed in order by farmers, artisans, and merchants. Neo-Confucian scholars argued that this system of social classes, based on the Chinese model, was not arbitrary but instead was natural. Emanating from nature, this system of four classes was not only legitimate but also unchangeable.

Since the Japanese never established a civil service examination system as had the Chinese, the orthodox status of Neo-Confucianism had a different meaning in Japan, and other forms of scholarship arose during the eighteenth century that challenged the dominance of Neo-Confucianism. One of the most important of these was called Ancient Learning. Adherents of Ancient Learning believed that Neo-Confucianism was a profound distortion of original or Classical Confucianism. They argued that Chinese Neo-Confucian scholars of the Song dynasty (960–1279) had borrowed ideas from Buddhism and Daoism in their studies of the Confucian classical texts, which resulted in misinterpretations propagated down through the centuries. The only solution, they asserted, was to return to the original texts and bypass Neo-Confucianism altogether. The most influential of the Ancient Learning scholars was Ogyū Sorai (1666–1728), who argued that moral philosophy was irrelevant to the establishment of effective government. Sorai's scholarship became highly influential throughout Japan, and Sorai himself became an adviser to the eighth shogun, Tokugawa Yoshimune (1684–1751). Sorai's scholarship was so popular that it became part of the curriculum at Hayashi Razan's school and, in the process, nearly displaced Neo-Confucianism.

Cycles of Decline and Renewal of Buddhism

After centuries of expansion from its birthplace in India to all parts of Asia, first southward (ca. third century BCE) and then northward (ca. first century CE), Buddhism had more or less been firmly established socially throughout the continent by means of missionary expansion along

the Silk Road trade routes. However, it has undertaken different processes of development, from marginal integration in China to full societal assimilation in Sri Lanka and Tibet. In all Asian countries, however, Buddhism has proved to have a major and enduring influence on local cultures. From the fifteenth to the eighteenth centuries, Buddhist communities were nevertheless challenged by environmental changes in their host societies. This period in the history of Buddhism is not very well documented, although the diversity of regional contexts explicitly discloses a cyclic process of decay and renewal in both southern and northern regions of Asia but for rather different reasons.

In Burma like elsewhere in South Asia, under the influence of the Mōns (a Burmese ethnic group) Buddhism spread out and took root in local settings in what are now the modern nation-states of Thailand, Laos and Cambodia. The Mōns were influential in a regeneration of Buddhist institutions, established in prior centuries throughout Asia, and were somewhat “corrupted” by their acclimatization to global societies. They impelled a “purge” of the *sanghas* (monastic Buddhist communities), the revitalization of the faith, and the building of sanctuaries. In Burma, King Dhammaceti (1472–1492) embarked on reforming the Buddhist Order after the foundation of the Mōn kingdom. During the Ayutthya kingdom (1350–1767) and after the adoption of Theravada Buddhism (“school of the elders”) under the Sukhothai sovereignty (1238–1448), Thailand followed similar transformations, and Buddhism was “purified” under Songdham (1610–1628) before flourishing again during the realm of Maha Dhammajara II (1733–1758). The Sinhalese experience was uneven. After the expansion of a great monastic civilization (which declined from the thirteenth century onward), the religious power of Buddhism weakened under the kingdom of Kandy (founded in 1581), a period of national division and political instability marked by the colonial influence of the Dutch and Portuguese in Sri Lanka.

The situation was quite different in northern Asia. In China, Korea, and Vietnam under Mahayana influence (Buddhism of the “great vehicle,” predominant in the north of Asia), Buddhist communities were threatened by the social and

political restoration of a neo-Confucianism, energized after the takeover of China by the Buddhist-oriented Mongols (thirteenth century) and its subsequent disintegration (fourteenth century). The Confucian reaction consisted of the restoration of the antique and ethical principles of social and symbolic order and harmony, firmly positioned against other faiths and significantly influenced by Buddhist and Taoist teachings. This process began in China under the Song dynasty (960–1279). The neo-Confucian movement spread to Japan during the Tokugawa or Edo period (1603–1868), to Korea under the Yi dynasty (1392–1910), and to Vietnam later in the fifteenth century, which led eventually to state regulation and the decreasing political influence of Buddhism. Although still deeply rooted culturally in Asian societies, Buddhism was challenged by unfavorable political forces. In return, the Japanese schools of Buddhism developed new strategies—ideological conversion to neo-Confucianism (especially in the Rinzai sect), alliances with the authorities (the shoguns or “military commanders”), and a refocus on philosophy and liturgy—a reason why Japanese Buddhism was intellectually flourishing although politically marginalized.

Tibet is a counterexample of these sinusoidal cycles of flux and reflux that Buddhism has undertaken throughout Asia. Yet the history of Buddhism in Tibet is also marked by a short and instable period of decline and renewal (at the turn of the tenth century). Afterward, however, the progress of Tibetan Buddhism showed unrelenting growth. Generations of great Indian masters visited the country, Tibetan masters were highly skilled, the major schools were founded, and the *dharmā* (Buddhist doctrine) was partially or totally adopted by the diverse populations of the vast provinces of Tibet in only four centuries. Years after its foundation (in the fifteenth century), the Gelug-pa school became a major social and religious force in Tibet. The lineage of the Dalai Lamas (meaning “ocean of wisdom,” a title assigned by the Mongols) has hence been instituted among the Gelug-pa, based upon and legitimated by the doctrinal system of the *tulku* (reincarnated masters), allowing both the transmission and the conservation of religious and political powers within the monasteries.

➤ HAKUIN, *THE EMBOSSED TEA KETTLE*, JAPAN

The religious history of Japan is marked by great spiritual figures, each of them being the source of a specific contribution to religion and culture. Hakuin (or Hakuin Ekaku, ca. 1685–1768) is one of them. He is considered responsible for a profound reform of the Rinzai tradition of Zen Buddhism that had been marginalized in eighteenth-century Japan and pursued the efforts of preceding reformers of Japanese Buddhism. His biography portrays him as a pious and inflexible monk, a zealous scholar in Buddhism in search of the truth who ended his life as one of the most famous Zen masters of his time. Committed to a “worldly” conception of Buddhism, he restored the use of very sophisticated soteriological techniques (aiming at spiritual salvation) such as the *koan*, words or anecdotes aiming at a reflection leading to enlightenment. “What is the sound of one hand clapping?” is the most reputed. He also reinstated a rigorous code of spiritual discipline, especially the practice of *zazen* (seated meditation), in order to attain the *satori* (awakening). These two techniques imprinted the hallmarks of modern forms of Rinzai Zen. Hakuin wrote many books and essays, including the renowned *The Embossed Tea Kettle* which has been translated worldwide.

—Lionel Obadia

The Buddhist Gelug-pa clergy consequently accessed the political leadership in 1642 under the sovereignty of the fifth Dalai Lama, Lozang Gyatso (1617–1682), and Tibet became the first Buddhist theocracy—a state of affairs that continued until the Chinese Red Army arrived in the twentieth century. At odds with the general oscillations between Buddhism and political power in surrounding regions, the case of Tibet in this period is a remarkable example of a complete fusion between religious and political power.

Christianity in East Asia

The so-called Age of Discovery, the period in which the Europeans began venturing forth into the oceans and encountering the lands of Asia and Africa, was more than just an initiation of trading routes and diplomacy. It was also a period in which Christianity left Europe, and to an extent western Asia, and spread along the trade routes being established. Unlike the Americas, where Christianity was imposed upon the native people, Asia would prove to be a much more complicated situation, especially in East Asia. The European position was a precarious one, and Christianity would have to be adopted by the Asians by choice rather than force. Established by the Portuguese, Goa became both a trading center and a missionary center in Asia. Goa was established as an archdiocese in 1557 and was used as a base by missionaries before traveling to places such as China and Japan in the hopes of finding converts. The first 50 years of missionary activities in Asia were dominated by the Franciscans and Dominicans, but progress was slow. They remained separate from the people; they did not learn the native languages, preferring to use translators instead. As a result, the newly baptized Christians normally consisted of women who lived with European men, slaves, or the extremely poor, what were called “Rice Christians.” This all changed with the arrival of the first Jesuits to Goa in 1542. The Jesuits were a new order and had a different approach to reaching the Asians. Starting with Francis Xavier, the Jesuits had much more

success as they attempted to learn the local languages and studied religious and philosophical texts. They were also the first to allow Asians into their order.

The missionary effort in Japan began with Francis Xavier, a Jesuit sent by King João III to establish a mission in Goa. After spending six years there, Xavier traveled to Japan in 1549 and laid the foundation for the Jesuit mission established in Kyoto in 1559. During the sixteenth century Japan was under the control of several different warlords. The Jesuits arrived in the wake of the Portuguese, who had brought with them not only an important link to the silver trade with Macao but also new weapons technology. These two elements became quickly linked as the daimyo began converting to Christianity and receiving in exchange the valuable technology that gave them an advantage over their neighbors. Oda Nobunaga was one in particular who used this knowledge to his advantage. With firearms, he quickly began defeating his neighbors and was well on the way to unifying Japan. In addition, the Jesuits were employing methods to make the Christian religion more attractive to the Japanese. The Jesuits modified their dress, diet, and hygiene to blend in with the Japanese. These efforts by the Jesuits met with success. Around 150,000 Japanese had converted by 1582, and 222,000 had converted by 1609. A printing press was brought to Japan in 1590, and the Jesuits used that as a tool of dissemination.

However, the methods that proved to be so successful during Japan’s “Christian century” led to their downfall. Part of Nobunaga’s fight was against the Buddhist True Pure Land Sect, which ruled over a large domain. His army was filled with Christians, and the Jesuits encouraged them to defeat the Buddhists. Nobunaga’s successor, Toyotomi Hideyoshi, originally protected the Christians and continued a relationship with them. Even though the firearms had been instrumental in the unification of Japan, Hideyoshi wanted to ensure that no one else would be able to repeat his successes; he restricted the Christians and expelled the missionaries in 1587. His distraction with conquering Asia meant that he did not enforce these laws, leaving the situation the same until his death in 1598.

ST. FRANCIS XAVIER IN ASIA

Francis Xavier (b. 1506) was one of the founders of the Jesuit order, and he is often looked at as the model for the Jesuits' missionary work in Asia. In 1540 he was appointed by King João III of Portugal to set up a mission in India. Xavier arrived in Goa, India, in 1542, and during the next six years he was able to establish Goa as the primary center of Jesuit activity. He also established the practice of learning the local language and customs in order to more effectively preach to the natives. This tool became the signature method of the Jesuits while out in the missions in both Asia and Latin America.

In August 1549 Xavier and two other Jesuits arrived in Kagoshima, Japan. Xavier is quoted as saying, "We shall never find among heathens another race equal to the Japanese." He remained in Japan for two and a half years, giving gifts such

as spectacles and clocks and wine to the elites and attempting to make ties with the learned class. By 1551 he had over 1,000 converts to Christianity. After learning about the scholarly nature of the Chinese people, he left Japan and attempted to make his way into China. However, on the way to China he took ill, and the expedition was forced to stop on the island of Sancian, just off the coast. He died there on December 2, 1552. Xavier left an equally large legacy in Japan. Just 20 years after his death, over 20,000 Japanese had been converted to Christianity even though there were never more than 9 Jesuits in residence at one time until 1563. Xavier also helped pave the way for the Jesuit Matteo Ricci and his mission in China, one that would prove to be a very important scientific exchange between East and West.

—Monique Vallance

The Christians received a reprieve for the first 11 years of the Tokugawa Shogunate. However, this period also saw the decline of the Portuguese monopoly over the Japanese trade and the entrance of the English and Dutch. In doing so, they did their best to turn the shogun against the Jesuits, hoping that doing so would turn the shogun against the Portuguese. During this time the Japanese Buddhists were organized into parishes to maximize governmental control, leaving the Christians outside government control. Despite the persecutions they endured, the Christians refused to recant, even when their lives were threatened. Tokugawa Ieyasu realized that this religion was a threat to his own power. In 1614 Ieyasu again banned all Christian missionaries. Many left, but there were still many who stayed behind in hiding, and Christianity continued to thrive. Tokugawa Hidetada was hostile to Christianity, and when he became shogun in 1616 he began organized persecutions of the Christians. He executed two Jesuits the next year, beginning a trend of executions and arrests. The Christian community continued to smuggle in priests, and upon discovering this in 1622, Hidetada executed 55 Christians and demanded that his daimyo join in the repression. They were

required to sign a statement swearing that they were not Christian and to travel once a year to their local Shinto shrine to step on a picture of the *pieta*. Many Christians were also tortured until they recanted their faith. Between 1614 and 1639 a total of 2,126 Christians were executed. The government campaign against Christians was intensified after the Shimabara rebellion in 1638 and effectively crushed the missionary efforts. The last Jesuit to enter Japan was the Italian Giovanni Battista Sidotti, who was imprisoned from 1708 to 1714, when he died of starvation. Despite this, there continued to be an enclave of secret Christians living in Japan who kept their practices alive through oral tradition.

Christianity existed in China in a much more peaceful manner. Francis Xavier dreamed of going to China but died on the voyage in 1552. Instead Michele Ruggieri, an Italian Jesuit residing in Macao, was given permission to enter China in 1580. He had learned to speak Mandarin and traveled through China with a shaved head and the dress of a Buddhist monk. This appearance probably facilitated the conversions that he achieved, but the progress was still slow. The spread of Christianity grew with the arrival of Matteo Ricci, who established the method by

which the Jesuits organized their mission. Their methods mimicked those of the Jesuits in Japan. They lived and dressed as Chinese natives and stressed to the elites the connections between Confucianism and Christianity. Ricci and his colleagues were accepted as learned scholars and had contacts with the emperor and his court. They also did not speak of sin but instead referred to ethics and showed the crucifix as little as possible in order to keep the Chinese from viewing Christianity in a negative light. After the victory of the Qing in 1644, the Jesuits stopped attempting to adhere to Confucianism and concentrated more on imperial service. This period saw a great amount of intellectual exchange, especially scientific and philosophical, between the Jesuits and the scholars of the imperial court.

The Jesuit methods were bitterly contested by the Spanish Dominicans, who arrived from Manila in the 1630s. This developed into what became known as the Chinese Rites Controversy, and both sides sent petitions to the pope defending their cases. Pope Alexander VII issued a papal bull siding with the Jesuits in 1656, but the disputes did not end. Matters were complicated by the arrival of the French at the turn of the century. At this time Chinese Christians numbered between 200,000 and 500,000. Controversy arose after Bishop Charles Maigrot attempted to ban Confucianism and keep the Chinese from attending ceremonies in honor of the dead. Although the Jesuits had many supporters in Europe, they shocked everyone by asking Emperor Kangxi to write a letter to the pope explaining that ancestor worship was not religious in nature. In 1706 Charles Maillard de Tournon, a French papal legate, met with Kangxi and informed him that the pope condemned ancestor worship. Infuriated, Kangxi expelled Tournon from his court and informed the Jesuits that they would either follow “the way of Father Ricci” or be exiled. Despite this decree, Pope Benedict XIV confirmed the decree of the former pope, causing a permanent schism between Catholicism and the scholarly elite. While Christianity continued to exist in China, it no longer held the influence that it had once had and afterward faded into the background.

The Spread of Christianity in Southeast Asia

It is important to make a distinction between the arrival of the Christian faith and its spread throughout Southeast Asia. As early as the late thirteenth century there are records of Catholic priests passing through the region while making their way to China. In 1291 the Franciscan John of Monte Corvino, who later became the first archbishop of Peking and patriarch of the Orient, stopped at certain points in Southeast Asia. Ordoric de Portu Naone, also on his way to China, stopped at Sumatra, Java, and Borneo around 1323. He visited Aceh and wrote of a kingdom south of Aceh called Sumatra. He was the first author to use the name Sumatra, although he wrote “Sumoltra.” Later in that century Bishop John del Marignolli traveled there and recorded that the number of Christian converts was very small, indicating the limits of Ordoric’s influence.

It was not until the coming of the Portuguese and the Spaniards that one finds any significant missionary activity in Southeast Asia. Francis Xavier (1506–1552), one of the original seven Jesuits who along with Ignatius of Loyola founded the Society of Jesus, was the best-known evangelist, traveling in the region, including time in Malacca, Amboina, Ternate, and Moro between 1545 and 1547. For the most part the Portuguese were not interested in converting the local population.

THE FRIARS IN THE PHILIPPINES

As one observer has noted, “The Spanish history of the Philippines begins and ends with the friar.”

Friars are members of the Mendicant Orders, which include the Augustinians who arrived in Southeast Asia with Miguel Legazpi in 1565, the Franciscans who came in 1577, the Jesuits who came in 1581, and the Dominicans who came in 1587. They were not known as missionaries, a modern term, but instead as *doctrineros*, or teachers.

The Spanish mission to the Philippines was a response to the friars’ experiences in the Spanish Americas. In Mexico, Peru, and the Caribbean the friars had been pioneers in Spanish conquest but were pushed out by later arrivals. But because few other Spaniards were willing to make the journey, first across the Atlantic and then the Pacific, to this remote outpost of the Spanish Empire, the Philippines represented an opportunity for the friars to regain the position and power they had lost in the New World.

As the Philippines lacked a lingua franca, or language common throughout the archipelago, concessions were made to the Mendicant Orders. The Spanish Crown allowed each order to take a portion of the archipelago for its mission, with all of the orders establishing houses in Manila and

parishes in the Tagalog provinces surrounding Manila. As the friars were the only Spaniards who could communicate with much of the local population, they gained significant power with both the Spanish authorities and Filipinos.

That the Philippines is now the only Christian nation in Asia points to the effectiveness of the friars’ work. But it also suggests the accommodations that Filipinos made with this invasive religion. In what John Leddy Phelan calls the Philippinization of Catholicism, Filipinos eclectically chose those aspects of this new faith that they would embrace. Although the church has been in the Philippines for more than four centuries, its historical role has been as an alien institution that extracted tribute in return for performing rituals. Financially supported by the Crown through the Patronato Real, or royal patronage, the friars served as agents of the Crown. And under the principle of *limpieza de sangre*, or purity of blood, they were quite unwilling to allow Filipinos to share in this privilege or to attain priesthood. Nor would they accommodate Filipino traditions, particularly the role of women as religious leaders such as priests, shamans, and healers.

—Damon Woods

Although Catholic priests are recorded as having spent time in Vietnam during the sixteenth century as the Portuguese attempted to set up trading posts, it was not until 1615 that significant missionary work, under the Jesuits, began to take place. Beginning in southern Vietnam, within a decade they set up a mission in the north. The most significant name associated with the beginnings of Catholicism in Vietnam is Alexandre de Rhodes, a French Jesuit who went to Vietnam only after Japan refused to allow in any more Christian missionaries. He is credited with developing *quoc ngu*, a Romanized system of writing Vietnamese, that made written Vietnamese accessible not only to European missionaries but also to the Vietnamese people. Unlike the Spaniards elsewhere, the Jesuits in Vietnam argued for a strong indigenous clergy and by 1650 had established a seminary of 100 students. Despite this success, the Catholic

mission to Vietnam faced two obstacles: (1) political hostility and persecution from various Vietnamese regimes and (2) a modest record of conversions, largely limited to the south and in the coastal regions.

Although the Protestant nations of the Netherlands and England came to Southeast Asia before the end of the sixteenth century, like the Portuguese their goal was to trade, not to convert the local population. Not until the end of the eighteenth century did the modern missionary movement begin, marking the spread of Christianity in Asia. The first Protestant missionary was Adoniram Judson, an American, who left for Burma in 1812. He settled in Rangoon, where he learned Burmese in order to preach and translate the Bible. His first convert came only after seven years of work. Later in his ministry Judson turned to the Karen, an ethnic minority in Burma. A significant number were

converted, and the Karen remain a predominantly Christian group.

In what is now known as Indonesia, Dutch East India Company merchants were fearful of offending the local Muslim population, so they discouraged missionary work there. Dutch officials even impounded a Javanese translation of the New Testament to prevent its distribution. This obstacle forced missionary societies to refocus their attention on ethnic minorities who worshipped animistic spirits in the fringe areas of the Moluccas, Timor, and the southwestern islands of Minahasa (northeastern peninsula of Sulawesi). The Rhenish Society, a German mission group, sent missionaries to southeastern Borneo in the first half of the nineteenth century; few converts resulted. Driven out in 1859 by an uprising, they move to Sumatra and worked among the Bataks. By the end of the nineteenth century one-third of the Bataks were Christian.

The twentieth-century U.S. taking of the Philippines was justified in part by the need for missionary work, that is, to convert Filipinos, Catholics, and animists alike to the Protestant faith. As President William McKinley told a group of religious leaders, he was convinced “that there was nothing left for us to do but to take them all, and educate the Filipinos, and uplift and civilize and Christianize them, and by God’s grace do the very best we could by them, as our fellow-men for whom Christ died.” Under U.S. domination, Christian teachings shifted from a traditional emphasis on the salvation of the individual to a Social Gospel that stressed social change through improvements in education, health care, and other advances.

Overall, Protestant missionary work in the countries of Southeast Asia, with the exception of Thailand, was limited by the exigencies of colonial rule. Colonial authorities were not sympathetic to meddlesome missionaries whose teachings on mercy and justice, they believed, could breed problems. Decolonialism and the independence movements that emerged following World War II, combined with the growth of the missionary movement in the United States, spurred rapid advances in the spread of Christianity throughout Southeast Asia. However, much of Southeast Asia remains non-Christian today.

Catholic Mysticism and Utopians

Late medieval and early modern Catholicism was marked by a wide array of contributions and responses to the intellectual, religious, and cultural shifts of the period. Two of these shifts, often associated with the humanist movement and the Renaissance, were a new kind of exaltation of the individual as well as a new spirit of confidence in human abilities to create well-ordered and just societies. Mysticism and the conception of utopian communities were two very different, yet not unrelated, expressions of these shifts, the former focused very much on the spiritual potential of the individual apart from the world and other human beings, and the latter emphasizing the moral, political, and spiritual potential of human societies in the world.

Mysticism, a religious experience of direct, intense contact and communication between the individual soul and the divine, is a phenomenon familiar to many religious traditions. In late medieval and early modern Catholicism, although it had a great heritage in medieval and early Christianity, mysticism became quite prominent with the examples of Teresa of Avila and John of the Cross in Spain; Catherine of Genoa, Maria Maddelena de’Pazzi, and Giuseppe of Copertino in Italy; and several others. Characteristic of Catholic mysticism is the experience of intense, ecstatic union between God and the individual soul. Teresa of Avila and John of the Cross were not embarrassed to describe the experience in explicitly erotic terms. The idea that the body, the passions, and the senses were

mysteriously yet fully involved in an intimately spiritual experience was an idea cherished by some Catholic thinkers in this period, especially after the onset of the Protestant Reformation, by which dualistic conceptions of the flesh versus the spirit gained renewed traction.

Mystical experiences were often viewed with ambivalence by Church officials who were concerned that they seemed to bypass the mediating role of the sacraments and Church authority. Throughout Europe laypersons (both men and women) were attracted to mysticism, whether exposed to it through personal contact with monastic orders such as the Carthusians and Carmelites or through lay and religious practitioners of the *devotio moderna* that originated in the Netherlands. Sometimes lay interest led to confrontation with the authorities. There were not a few men and women, lay and religious, tried by the Inquisition in Spain, for example, to test the authenticity of mystical claims. The Church honored individuals such as Teresa, who was canonized a saint, but stressed that mystical experiences of God were exceptional and best left in the hands of professionals such as Teresa, who made lifelong commitments to a life of contemplative prayer and who developed methodological approaches to mysticism that could be pursued in the controlled, communal setting of the monastery. Despite these restrictions and precautions, however, Catholic mysticism stood out as a profound statement regarding the spiritual, indeed divine, potential of the individual human person.

Very different from mysticism, although not unrelated in its confidence in human potential and ultimate focus on spiritual well-being, were late medieval and early modern Catholic utopian movements. The term “utopian” is a somewhat catch-all scholarly category for what are best understood as very diverse movements—intellectual, social, and political—ranging from humanistic imaginings of the best possible human society to the formation of religiously based communities. These were inclusive of laymen and laywomen, oriented toward achieving social justice and peace in the world despite the perennial problems of sin and evil.

The word “utopia” literally means “not a place” in Greek and was coined in 1516 by the English Catholic humanist Thomas More for the

Detail from St. Teresa of Avila before the Cross, by Guido Cagnacci, seventeenth century. Teresa of Avila was a Spanish mystic and saint who reformed the Carmelite order during the mid-sixteenth century. She is depicted in tears and wearing a crown of thorns. In her hand she holds a crucifix with a figure of Christ and a Madonna lily (Lilium candidum), the symbol of chastity and innocence. (Jupiterimages)

title of a philosophical work that imagined a best-possible human society. Utopia—likely set in the Americas—followed no recognizable religion, and its property was largely held in common. Men and women lived peacefully together and were oriented toward happiness, which was identified with a life of virtue. Utopia was not perfect, however. It faced problems such as the need for coercion to maintain social order. It is arguable that More intended the text as an ironic commentary on the politically and socially optimistic mood of many contemporaries and was subtly expressing an Augustinian vision of a world fraught with corruption and sin and in need of the Church’s guidance and of the rule of law.

Beyond imaginative projects such as More’s there were vibrant, practical movements of Catholics that were akin to monasticism in their commitment to prayer, voluntary poverty, and

► THE BRETHREN OF THE COMMON LIFE

In the late fourteenth century a Dutch layman from a family of cloth merchants was silenced by Church authorities for preaching against clerical abuses and against what he believed was the externally oriented formalistic religious culture of his day. Gerard Groote (1340–1384) was the founder of the Brethren of the Common Life, a movement of laymen and laywomen who lived in a community devoted to work, prayer, and service to others and who held property in common and remained celibate. Unlike monks and nuns, they took no vows and saw their radical lifestyle as being in the world, oriented as much toward social transformation as toward prayer and contemplation.

Groote did not live to see the communities he founded grow into a widespread movement that greatly affected Catholic piety and aspirations for Church reform in the fifteenth and early sixteenth centuries. Concentrated in the Netherlands but spreading throughout central Europe, the Brethren initially focused their work on cottage industries such as manuscript copying and binding and cloth weaving. Later they devoted labor to educational

enterprises, founding student dormitories and local schools where the new humanist learning and the prayer methods of the *devotio moderna* were cultivated. Erasmus of Rotterdam was a student of the Brethren, as were Thomas à Kempis, Gabriel Biel, and Pope Adrian VI.

The Brethren were devoted to lay piety and social transformation through prayer and work in a manner that boldly combined utopian aspirations for human society with aspirations for highly individual and even mystical connections with God. Historians have for a long time linked their predilection for lay piety, individualized prayer, and humanism to the religious culture that birthed the Protestant Reformation, but their relationship to Catholic reform movements has also been explored. Many of their schools closed down during the religious conflicts of the sixteenth century, but some lasted through the late eighteenth century, and their influence also extended to many diocesan seminaries, Counter-Reformation teaching orders, and even the foundation of some European universities.

—Bronwen Catherine McShea

a communal lifestyle but that were self-consciously in the world. They included laymen and laywomen and were oriented toward the reform of society through charitable service, helping the poor, the elderly, and the sick. The Brethren and Sisters of the Common Life were the most well known of these movements. Another movement centered around the Oratory of Divine Love, founded in 1497 in Genoa by Ettore Vernazza, a layman who had been inspired to a life both of regular, frequent prayer and active service to the sick by the mystic Catherine of Genoa.

Utopian impulses were also strongly present among many Catholic missionaries in colonial America. Apocalyptic visions of establishing the Kingdom of God on earth reflected both a spirit of confidence in the possibilities of the age as well as Counter-Reformation Catholic desires to set up a new purified Church—some missionaries even used the phrase “New Jerusalem”—in pagan lands untouched by European

Christendom’s religious, political, and social divisions. The most impressive enterprise informed by these ideas was the network of Jesuit missions among the Guaraní Indians of Paraguay, southern Brazil, Uruguay, and Argentina. Throughout the seventeenth and early eighteenth centuries the Society of Jesus oversaw the region, with the permission of the Spanish Crown, in isolation from the colonial *encomienda* system. They encouraged the nomadic Guaraní to settle into communities, or reductions, that sometimes numbered more than 20,000. The reductions were modeled on the early Christian communities described in the Gospels, holding land in common and distributing equally among themselves the goods they produced. Their economic practices—which included a short workday with leisure time devoted to cultural activities and prayer—were so successful that thriving industries developed based on the reductions. This success proved to be the downfall of the enterprise, as Spanish and Portuguese authorities

concluded that the Jesuits were gaining too much power and economic independence in the region and posed a threat to their colonial rule. The missions closed in 1767 when the Jesuits were expelled from the region.

The South American reductions may seem far removed from mystics such as John of the Cross or Catherine of Genoa. However, relationships between Catholic mysticism and utopian enterprises could be very real and personal. The founder of the Jesuits, Ignatius of Loyola, was deeply influenced by mystical piety, and he cultivated methods of prayer that were at once based on the capacity of individual souls to attain to the heights of spiritual experience as well as to engage in active, effective lives of service to others. The order he founded exhibited tremendous confidence in the possibilities of social and even political efforts within communities while also exhibiting a degree of confidence in the individual that had few precedents in Catholic history. It is perhaps a peculiar feature of early modern Catholicism and of the larger historical moment in which it existed that such intensely individual as well as communitarian enterprises could develop alongside each other with equal prominence to influence the life of the Church.

Protest and Reform

The Protestant Reformation began as the attempt by individual theologians and pastors to correct various abuses within the Roman

Catholic Church, but what began as concrete expressions of concern and criticism gradually coalesced into the basis for the creation of new ecclesiastical and educational institutions. Older scholarship emphasized the Reformation as the dawning of a new era after the dark night of the European Middle Ages. But more recent research has shown that in addition to certain kinds of doctrinal and ecclesiastical discontinuity, there are important theological, educational, and social continuities between the Middle Ages and the early modern era.

On April 18, 1521, the Wittenberg university professor and former Augustinian monk Martin Luther (1483–1546) appeared for the second time before Holy Roman Emperor Charles V at the imperial Diet of Worms. Luther had publicly challenged a number of practices of the Roman Catholic Church, including alleged abuses of indulgences and the tyranny of the papacy. Having been excommunicated by the pope, Luther was asked by imperial representatives to defend the books he had written and to recant anything he was unwilling to defend. Luther's refusal to recant in the face of political and ecclesiastical pressure encouraged others to voice their own criticisms of the Church.

Luther himself continued to be a prominent voice of what was self-described as the “evangelical” movement, because it emphasized the “good news” (*evangelion*) of the Christian faith. As Luther and others continued to develop complaints against the state of the Roman Catholic Church, they were aided by various political figures who acted to protect them from retaliation. In 1530 Charles V called another diet, this time in the city of Augsburg, so that Luther and other theologians as well as like-minded German princes and city officials could further explain and defend their views. Philip Melancthon (1497–1560), a friend and fellow professor with Luther in Wittenberg, penned the Augsburg Confession (*Confessio Augustana*) to be presented to the emperor. Those who defended their views at the Diet of Augsburg are those most properly called Protestant (from the Latin *protestari*, “to publicly declare”), but the term “Protestant Reformation” has often been used to include a number of other groups critical of the Roman Catholic Church.

➤ JOHN CALVIN—*INSTITUTES OF THE CHRISTIAN RELIGION*

The first edition of John Calvin's *Institutes of the Christian Religion* was published in 1536 as the reformer sought to articulate basic instruction in the faith for the people of France. The populace was, at least by Calvin's standards, shockingly ill-educated in matters of Christian doctrine. Over time what began as a basic doctrinal manual eventually became a larger project, focused not only on providing the elements of the faith but also on comprehensively articulating a systematic statement of Christian teaching and answering criticisms of Calvin's theology by various opponents. The *Institutes* went through a number of revisions in the Latin and French editions appearing between 1536 and 1560. But Calvin's basic theological method remained the same. While commenting on the biblical text, in order to keep his exegesis "short and easy" (*brevitas et facilitas*) Calvin would extract long doctrinal discussions or excurses from his commentaries and place them into a different work, his *Institutes*, whose ordering was inspired by the Pauline model provided by Philip Melancthon's *Loci communes* (1521). The *Institutes* was an organized collection of doctrinal discussions drawn out of his exegesis and therefore represents one aspect of Calvin's theological project, a genre distinct from his biblical commentaries and sermons.

—Jordon J. Ballor

Along with the Lutherans who held to the Augsburg Confession, other figures were agitating for reform in the Church. Huldrych Zwingli (1484–1531) and after him Heinrich Bullinger (1504–1575) in the Swiss city of Zurich, along with other theologians and pastors including Johannes Oecolampadius (1482–1531) in Basel, Martin Bucer (1491–1551) in Strasbourg, and John Calvin (1509–1564) in Geneva, led the other branch of the so-called magisterial Reformation. The Reformed and the Lutherans are called magisterial because of the essential role that the civil magistrates and other political authorities played in supporting their causes. The Reformed also had a generally positive view of the role of the civil magistrate in promoting

godly behavior, and they emphasized their doctrinal solidarity with what they considered the best of the Church Fathers and the medieval scholastics. Although the Reformed shared with the Lutherans many criticisms of the theology and practices of contemporaneous Roman Catholics, they disagreed over a number of issues including the Lord's Supper.

A third group of reformers are sometimes called radical because of their emphasis on returning to the root (*radix*) of the Christian faith, the early Church. Whereas the magisterial reformers advocated various kinds of partnerships between the powers of the church and the state, the radical reformers tended to view the state with greater suspicion and denied that Christians could legitimately act as political authorities. These radical reformers are also sometimes called Anabaptists because they taught that the practice of infant baptism, largely accepted by Roman Catholics, Lutherans, and Reformed, was illegitimate, arguing instead that baptism of professing adults was the only valid form of baptism. While the radical reformation comprised groups with a great diversity of theological expression and practice, the Schleithem Articles of 1527 serves as a representative statement of Anabaptist tenets.

While many who advocated reform of the Roman Catholic Church were either excommunicated or voluntarily withdrew from papal authority, a number of those who remained within the Church also worked toward reforms of various kinds. Some of these changes were made in direct response to the Protestant Reformation, but others addressed some of the same issues against which Luther and others had complained. This movement is sometimes termed the Catholic Reformation or the Counter-Reformation. The Council of Trent (1545–1563), for instance, was convened both in order to respond to Protestant doctrines and to correct abuses within the Roman Catholic Church. The Society of Jesus (Jesuits) is a Catholic religious order founded by Ignatius of Loyola (1491–1556) and confirmed in 1540. Loyola initially focused on the reform of the self but through the Jesuit order increasingly emphasized wider institutional reform and the expansion of papal influence.

The reformation in England was undertaken at the instigation of King Henry VIII and involved the formation in 1534 of an English church separated from the authority of the Roman pontiff. The Church of England, or Anglican Church, was instituted under the Thirty-Nine Articles of Religion in 1563, and over the next two centuries myriad figures would work for continued reform in the British Isles, whether from within (conformist) or outside of (nonconformist) the institutional church. These so-called Puritans represented a diversity of perspectives on theological and social matters but generally supported efforts to deepen personal piety and renew institutional worship. These kinds of concerns were later taken up by John Wesley (1703–1791) and were institutionalized in Wesleyan as well as Presbyterian churches.

On the European continent there were also major pietistic movements associated both with the magisterial as well as the Anabaptist reformations. The Dutch Further Reformation (Nadere Reformatie) stands as an example of a post-Reformation movement that shared with English Puritanism a significant emphasis on personal and social renewal.

The various reformations of the sixteenth and seventeenth centuries would have a worldwide impact, especially through the work of evangelism and global missions. Protestant missionaries often accompanied the expansion of European trade and colonization into the Atlantic world and Asia.

The Catholic Response and the Rise of New Orders

The period of revival of the Catholic Church and its reaction to the rise of Protestantism is known as the Catholic Reformation. The Catholic Church had been battling schism, oppression, and resistance long before the Protestant Reformation. The shock of the Protestant movement spurred the Church into adopting reform measures of its own, including the reorganization of pastoral and educational work and the cleansing of the administrative infrastructure.

The Catholic Church was in a state of decline during the sixteenth century. Many bishops held a plurality of posts and were an inconsistent presence in their dioceses. There was a definite lack of priests and monks as well, and as a result many parishioners became distant from the Church. Protestants took advantage of the situation and preached the reformed religion. New orders emerged within Catholicism led by men determined to curtail the spread of heresy. These orders attempted to return the Church to its former status.

The Capuchin and Theatine orders stressed mendicant values including humility, charity, poverty, and pastoral care, but these revived principles only exacerbated the moral decay of the Church. The Capuchins appeared around 1520 and were an order of friars who were recognized as the only permanent offshoot of the Franciscans. They made examples of themselves among the people by virtue of their austere and pious lifestyle and won many converts from Protestantism to Catholicism. The Theatine order was founded in 1524. The Theatines also lived a life of extreme poverty and strict rules. They worked assiduously to restore the clergy to a virtuous life and to reestablish the Church as a moral institution.

The Jesuits were the most influential of the Catholic orders that developed during the Counter-Reformation and emerged in part as a reaction to both Protestantism and the Inquisition. Orthodox Spain had launched the Inquisition

THE SPANISH INQUISITION

The Spanish Inquisition was launched in Spain on November 1, 1478, during the reign of Fernando and Isabel, particularly against the pseudoconverts from Judaism and Mohammedanism. Under Thomas Torquemada (1420–1498), the Inquisition was at its bloodiest. Once Cardinal Ximenez assumed the position of inquisitor-general, the Inquisition focused more on morality and the reform of the Church. Historians continue to debate whether the Inquisition was the reason why Spain did not endure civil wars like those in France and Germany.

In its efforts to eradicate heresy, the Inquisition developed from a purely religious act to full-fledged spectacles involving burning, drowning, and torturing suspects in an auto-de-fé, or act of faith. Censorship came down heavily on the arts. For example, artists were instructed on how many feathers should be on an angel's wing in order to remain within the bounds of orthodoxy.

The Inquisition also swept through Rome and Portugal. The Inquisitions of the early modern era were more violent and centralized than those of the medieval period. Orthodox Catholics were also subject to the Inquisition, and St. Ignatius of Loyola, St. Teresa of Avila, and Galileo Galilei were among those investigated for heresy. After 1700 the Inquisition began to decline, and the institution was finally abolished in the nineteenth century.

—Breanna S. Griego

in 1478 in an attempt to eradicate any and all forms of heresy, but Ignatius Loyola did not want the revival of Catholicism to be cast in blood. He founded the Jesuit order to espouse strict organization and nonviolent piety based on unquestioned obedience to the pope. The Jesuits worked directly for the pope and were officially recognized in 1540. They gained access to powerful rulers, stood as devout models for political leaders, exacted educational reform, and led missionary activity. The order was similar to Calvinism because both stressed physical and spiritual discipline. However, many Jesuits were tortured and persecuted throughout Protestant Europe and were attacked for their persuasive methods of conversion.

Erasmian humanism encouraged tolerant attitudes and produced irresolute reactions to heretical movements in western Europe. The Catholic Church had to resist the incursion of reforming attitudes from within the Church as well. Successive popes focused their efforts on strengthening the authority of the Church, but when Charles V and his mutinous army sacked Rome in 1527, Europe believed that divine punishment had been cast upon the papacy.

Recognizing the need to overcome the divisive schism between Catholicism and Protestantism, Paul III convened the Colloquy of Regensburg in 1541. Luther sent Melancthon, Calvin was present, and even Charles V advocated unity. The pope, in light of the success of the Spanish Inquisition, instituted the Inquisition in Rome in 1542 in an attempt to root out heresy. But pressure continued to grow for a general council to try to reconcile the division where the pope had failed. The Council of Trent was called in 1542, although it did not officially begin until 1544. The pope feared the power of the council, which revived memories of the medieval conciliar movement that had threatened to undermine papal authority. However, the infiltration of Protestantism into Italy and the failure of previous meetings weakened his position. The council set out to clarify dogma and to institute reform of the Church. Although Protestants appeared for one session of the council, it was largely a Catholic enterprise. The meeting reaffirmed justification by faith through God's grace, acknowledged the traditional sacraments, and banned pluralism in bishoprics. The council was convened several times, and the final session was called during 1562–1563 just as France broke into violent civil war. The Council of Trent gave Catholicism a clear and definite theology and produced greater conviction among its adherents.

The Counter-Reformation reinvigorated the vitality of the Catholic Church against the growing influence of Protestantism. Although many Catholics united behind the cohesive dogma and reorganized administration of the Church, Protestantism had become a powerful force, and the Counter-Reformation struggled to hinder its progress.

Global Cult of Mary

Mary (or Maryam in the Islamic tradition) was the mother of Jesus. In the early modern world her cult expanded to global proportions. According to the New Testament and the Quran, she conceived but remained a virgin. Marian devotion and the expansion of the cult were facilitated by her increasingly enigmatic characteristics. Noteworthy Marian apparitions occurred with the greatest frequency and range in the Americas, the most famous being that of the Virgin of Guadalupe near Mexico City (1531), but she was also believed to have appeared in Prague (1570), in Spain (Córdoba, ca. 1600), in France (Our Lady of Laus, 1664, and Marie Lenormand, 1769), and in Velankanni, India (after ca. 1580). In 1672 the Jesuit Wilhelm Gumpenberg published the *Atlas Marianus*, an illustrated global list of over 1,200 miraculous images of the Madonna.

In Europe, medieval Marian piety endured in early modern Catholicism, and common devotional practices such as the rosary were reaffirmed by the Council of Trent (1545–1563). New devotions also appeared, such as that of the Immaculate Heart of Mary, established in 1648 by Jean Eudes (1601–1680). The Feast of the Immaculate Conception was established in 1483, but whether Mary had herself been conceived without original sin would be debated for another 350 years. Dominicans in Bern (1507–1509), for example, faked an apparition of Mary who announced that she had been indeed conceived in sin, while the seventeenth-century diarist Josephe Mugaburu of Lima reported that an angry congregation had hounded a Dominican

Left: Nuestra Señora del Mayor Dolor, Chapel of the Hospital, Christo de la Buena Muerte (Christ of the Good Death), Algeciras. Note Mary's sad but accusing gaze at the onlooker together with her hands pointing to her dead son, as if to say "Look what you have done. This is your fault!" Right: Etching from the Historical Relation of the Kingdom of Chile by Alonso de Ovalle, SJ (Rome, 1696). La Virgen de las Nieves (the Virgin of Snows) is portrayed routing the Araucanian Indians outside the city of Concepción (unfortunately, Ovalle does not give a date for the victory). (Andrew Redden/Archivo de la Merced de Santiago)

from the pulpit for refusing to preach on the subject. Philip III of Spain (1598–1621), however, was only accepted as king by the councils representing the kingdoms of Spain on condition that he defend the doctrine of the Immaculate Conception with his life. Throughout this period, the cult of Mary was assisted by Renaissance and Baroque composers setting to music a large repertoire of Marian prayers.

The Orthodox tradition developed a rich Marian liturgy, but she plays a notably lesser role in its theology of salvation. Despite this, the figure of Mary as Empress, Queen, and Mother of God was always prominent in Orthodox iconography and formed the basis of a widespread and ancient devotion. Similarly long-standing, the celebrated hymn "Praise of Mary" is believed to have been translated through three consecutive traditions, from Syriac or Greek to Coptic, then Arabic, and finally its present Ethiopian text.

Although the first Protestant reformers accepted the virginity of Mary, their successors broke with the Catholic (and Islamic) viewpoint by taking biblical references to brothers of Jesus as proof that Mary and Joseph later had sons, which signified that she did not remain a virgin.

Distinctively Protestant, however, was the rejection of Mary as an intercessor between mankind and God. Despite the extensive destruction of Marian shrines during the Reformation, “Mary” still became an increasingly popular name for Protestant girls. Even the Protestant Elizabeth I of England was sometimes portrayed as a second Virgin Mary.

In art, the medieval Mary, covered with her son’s blood and emotionally overcome by his death, became a more stoical figure suffering only silently, perhaps reflecting a return to the aesthetics of the iconography of the Eastern and the Early Church. That this tradition continued in the early modern Western Church is evidenced by the ubiquity of images like the Pietà (made so famous by Michelangelo’s sculpture of the same name). The numerous representations of the Virgin of Dolores (La Virgen de Dolores, or “The Virgin of Pain and Suffering”) in Spain and the Americas often retained a tear that glistened on a face wrapped in grief to better provoke within the congregation a feeling of guilt and repentance for the death of her son. In Algéciras in the hospital chapel of Christ of the Good Death, a grieving Mary (called Nuestra Señora del Mayor Dolor, “Our Lady of the Greatest Pain”) looks directly at the devotee with her hands open, pointing at her dead son on her lap, with an accusatory expression. Madonnas portrayed with black skin were common, for reasons uncertain and perhaps unintended, although one contemporary explained it as a result of Mary’s intense grief. The Black Madonna of Częstochowa, an icon supposedly painted by St. Luke, was thought to have saved a monastery from a Swedish invasion and in 1656 was crowned by King Jan Kazimierz as queen and protector of Poland. Baroque columns topped with a statue of Mary, known as Marian columns, were popular especially in Italy and Habsburg lands and were sometimes built in thanks for deliverance from invasion or plague.

In Spain, Jewish converts to Christianity stressed the Jewish origins of Mary, and her blood purity was discussed. A legend from Seville, at least as old as 1494, explains that a statue of the Virgin gave victory to the thirteenth-century Castilian king Fernando III in his wars against the Muslims. During the reconquest,

Marian devotion centered around the recovery or finding of images in once Muslim-controlled territory, and many mosques were converted into churches dedicated to Mary. Nevertheless, some continued to attract Muslims, perhaps because of the resonance of Maryam in Islam.

The Virgin traveled to the New World with Christopher Columbus and his sailors as Stella Maris, or “Star of the Sea”; at least this was the particular Marian devotion that these explorers carried with them. Indeed, one of the three ships that crossed the Atlantic on Columbus’s first voyage was called the *Santa María*. Once there she reprised her role as conqueror and became *La Conquistadora*. According to tradition, her intervention facilitated the Spanish conquest of Tenochtitlan (1521), saved the Spaniards from losing control of the newly conquered Cuzco (1536), and as the “Virgin of the Snows” (la Virgen de las Nieves) intervened in a battle in Concepción, Chile, saving the Spanish from defeat and routing the Araucanian Indians.

In Cuba and Brazil, the Yoruba (present-day Nigeria) goddess Yemaja (Iemanjá) merged with the Christian Virgin. A devotion to Our Lady of Częstochowa (along with her image in this particular form) was imported to Haiti and would come to represent the voodoo spirit Erzulie. Similar syncretisms occurred in colonial Mexico and Peru, where the earth goddesses Coatlicue and Pachamama merged into the figure of Mary. In Alto-Peru (Bolivia), the Virgin became embedded in the Silver Mountain of Potosí as she and the earth-goddess became one. In the Americas, official attitudes to such syncretisms were ambivalent throughout the colonial period and very much depended on time, place and circumstance. Some missionaries, such as the first Franciscans in New Spain (Mexico), actively encouraged these associations. Similarly, in Potosí painted representations of the Virgin as the Silver Mountain were not uncommon, indicating that this devotion was relatively widespread. If we can talk in general terms, Marian cults were usually encouraged, despite ever-present worries among certain sectors of the Church about worship of indigenous or African gods in disguised form.

At Velankanni on the Bay of Bengal, three apparitions of Mary—one involved in rescuing

Portuguese sailors from a cyclone—led to the erection of a church there. The year 1598 saw the first celebration of Mary's role as protectress of Japan. In the seventeenth century, the persecuted and isolated Christians of Japan developed their own tradition of Mary, who was said to have grown up in the Philippines, where the king fell in love with her. Unfortunately for him, an unseasonal snowfall demonstrated the divinity of her virginity. Mary was taken up to heaven, and the king died of a broken heart. They then met and married in heaven. The snowfall comes from a thirteenth-century Roman legend, the setting reflects the Philippines' importance to the East Asian missions, and Mary's becoming a queen of the Philippines in heaven suggests an attempt to recognize her royal divinity without recourse to the more abstract notion of her as Queen of the Angels.

In both China and Japan, Mary became identified with Guanyin (Kannon in Japan), herself a synthesis of the Indian male bodhisattva Avalokitesvara and an East Asian goddess of mercy. In Japan, small cross marks turned Kannon statues into discrete objects of Mary devotion for persecuted believers. The Daoist-Buddhist pantheon guide *Shenxian Tongjian* (published in 1701) includes a Mary being taken up into the ninth (highest) level of the Buddhist Pure Land. Porcelain Guanyins were exported via the Philippines to Latin America as Sancta Marias.

Notwithstanding belief in Mary's participation in wars of conquest, the Marian cult gave solace to millions of devotees worldwide. Many believers took heart from their certainty that the Queen of Heaven interceded for sinners at the Last Judgment. From a more secular perspective, however, Mary can also be seen as a symbol of the cultural globalization that occurred in the context of the expanding empires, trade routes, and missionary networks of the early modern world.

The Global Cult of Jesus

The historical Jesus (d. ca. 33 CE) was a Jewish religious teacher. Christians recognize him as Jesus Christ, the only incarnation of God; Muslims know him as Isa ibn Maryam (Jesus son of Mary), the last prophet before Muhammad. Because of Jesus's importance to both these missionary religions, he was the most universally recognized figure in the early modern world. Their contacts with non-Western cultures led to the creation of syncretic Jesus figures across the globe.

In Europe, the Protestant reformers accepted medieval Latin Christology largely intact, and they depicted Christ as a single person in whom both a divine and human nature were inseparably united. Perhaps the most important point of dispute was the nature of the mass as re-creation of Christ's sacrifice, which Protestants felt was insulting to Christ, as if his crucifixion were insufficient to atone for all sin. In Luther's conception the entire Bible was about Christ, and Jesus's teachings and miracles were insignificant in comparison to his sacrifice and mission. Popular illustrations of the reformers' criticisms contrasted a poor Jesus crowned with thorns to a wealthy pope crowned with the triple tiara.

Jesus was equally important in parts of Europe less influenced by the Reformation. The Council of Trent (1545–1563) encouraged Catholics to continue the remembrance of Christ's passion and the mass ritual. In Jewish circles, the medieval gospel parody *Toledoth Yeshu* remained popular. In Spain in 1595, the discovery of lead disks revealed Arabic inscriptions that appeared to be a first-century record of the Church. These writings offered a syncretic message for Catholics and Muslims, honoring Jesus with a variation of the Islamic *shahadah* creed: "there is no god but Allah and Jesus is the spirit of Allah." The Arabic script was suspect, however, and the Church condemned the disks in 1682.

This eighteenth-century sculpture, Nino Jesus (Christ Child), from Puerto Rico, exemplifies the devotion to the Child Jesus. Long important in Spain, the cult expanded during the early-modern period via the Spanish empire into Mexico and the Philippines. The unpretentious execution of this object suggests the popularity of the Child Jesus, who was often associated with protective miracles. (Smithsonian American Art Museum, Washington, DC/Art Resource, NY)

Islamic teaching had venerated Jesus as a central spiritual figure since its inception, which has encouraged some Christians to view Islam as a heretical version of Christianity. The Jesus of the Quran is committed to “cleansing” false Christian understandings of his divinity (3:55), but as Islam developed, Jesus appears to take up a great variety of roles. The Hadith tradition included a Jesus who would return before Judgment Day to slay the Antichrist (and all pigs) and thus bring forth an age of peace on earth. Jesus developed in other Arabic literature as the object of popular devotion, as a combatant in theological disputes, or as a model of asceticism

or etiquette. The Shia theologian Majlisi (d. 1698) described a Jesus explaining that because money is a disease and scholars are doctors, we should beware of “doctors” too eager to catch “diseases” for themselves.

Most distinctive to the early modern period was Muslim rulers’ use of Jesus to bolster their own authority. Shah Ismail (r. 1501–1524), founder of the Safavid dynasty, identified himself as Jesus in poetry written in the language of the Muslim Turkmen tribesmen to the west, presumably in an attempt to win their loyalty. A century later, in the ceremonial capital city Fatehpur Sikri, Akbar the Great of the Mughal empire in 1602 erected the huge Gate of Magnificence (Buland Darwaza) leading into the mosque, with the Arabic inscription “Said Jesus, on whom be peace! The world is a bridge, pass over it, but build no house therein.” Written next to an inscription celebrating the conquest of Gujarat and Kandesh, the words of Jesus anticipate and dispel any censure of Akbar’s satisfaction.

Missionaries and colonists brought Jesus throughout the world. The Jesus figure received a mixed reaction in China. In 1600, one customs officer inspecting missionary gifts for the emperor was impressed by the benign realism of a painted Madonna and Child but thought that a crucifix was a device designed to assassinate the emperor. The *Shenxian Tongjian* (1701) includes Jesus among the Daoist-Buddhist pantheon.

In the Americas, European immigration and an expansionist Christian ideology gave the Jesus figure its greatest purchase. New Spain alone boasted at least 156 shrines to Christ, with crucifixes that were said to sweat, bleed, and provide protection from epidemics and famine. In colonial New England, one Puritan pastor spoke of hurting his “husband” Jesus by “liking other loves more than him”; another wrote of preparing his heart like a “featherbed . . . with gospel pillows, sheets, and sweet perfumes” so that he might be “impregnated” by Jesus. Such language caused some concern about undermining the institution of marriage but may have drawn men to New England’s congregations. To the disgust of their Calvinist and Lutheran contemporaries, Moravians took this one step further by describing Christ in female terms and taking the wound in his side to be a womb.

Although slave owners used biblical passages to justify slavery, many slaves were drawn to Jesus, and the South saw the widespread conversion of slaves by the late eighteenth century. In 1764 the Reverend John Cleaveland recorded the second conversion experience of Massachusetts slave Phillis Cogswell. The following quote is taken from scholar Erik R. Seeman's 1999 article:

"while I was about my work, those words came to my Mind, come unto me all ye that labor and are heavy laden and I will give you rest. I thought with myself, I am weary and heavy-laden, I have a burden of guilt lying on me, Christ is all-sufficient to give rest—I may come; I will come to Christ for Rest."

By the eighteenth century, Enlightenment thinkers in both Europe and the Americas expressed strident criticism of the Catholic Church and skepticism about religion generally. Yet an ideology that raised reason above superstition still found a place for Jesus, praising his teachings while ignoring his alleged miracles. In America, Benjamin Franklin could thus urge readers to emulate Jesus as well as Socrates.

Jewish Messianic Movements

Throughout Jewish history, there have been numerous claimants to the title of Messiah, the prophesied leader who would restore the Jews to Israel and rebuild the Temple at Jerusalem. The early modern period saw several Messianic movements. Catastrophes for the Jews, most notably the persecutions in the Iberian kingdoms that culminated in the expulsions of 1492, were viewed as the "birthpangs of the Messiah" and raised Jewish interest in the possibility of deliverance. An early-fifteenth-century Messiah, the mysterious David Ruebeni, presented himself as originating from a Jewish kingdom in Arabia where his brother was the king and spoke of a Jewish-Christian alliance against the Ottomans. He won audiences with Pope Clement VII, Emperor Charles V, and King João III of Portugal before falling into the hands of the Spanish Inquisition in Llerna, where he probably died, as no more was heard from him after this. However, his final fate remains uncertain. One source claims that he was killed in Llerna in 1535, while another claims that he was executed by the Portuguese Inquisition in 1541. Ruebeni had a disciple, Shlomo Molko, a Portuguese Jew who had been forcibly converted to Catholicism and returned to Judaism under Ruebeni's influence. Molko also made Messianic claims and was executed by the Spanish Inquisition in 1532. A German Jew, Asher Lemlein, had a short-lived but well-publicized Messianic career around Venice from 1500 to 1502.

The Kabbalistic movement associated with the Palestinian town of Safed in the late sixteenth century contributed to a redefining of the Jewish Messiah, away from the political Messiah whose main task was the restoration of the Jews to Israel to a cosmic being who would repair the broken cosmos. Although Messianic thought did not play a central role in Kabbalah, Rabbi Isaac Luria (1534–1572), the leader of Safed, or "Lurianic," Kabbalism, and his disciple Hayyim Vital (1543–1620) were spoken of by their disciples and admirers in Messianic terms.

The most widespread and important Jewish Messianic movement of the early modern period was that of Sabbatai Zvi (1626–1676), a student of the Lurianic Kabbalah and Jewish law from

Izmir in Asia Minor. Sabbatai followed eccentric practices like swimming in the sea at night and in 1648 first proclaimed himself the Messiah, a proclamation that attracted little attention except to get him excommunicated and banned from Smyrna. He spent the next several years wandering through Greece and Palestine gathering followers. He married a woman named Sarah who had been orphaned during the Chmielnicki massacres of Ukrainian Jews in the late 1640s and who had lived as a prostitute for several years.

The key moment in the early history of Sabbatianism is Sabbatai's meeting in Israel with the brilliant Kabbalist Nathan of Gaza (1643–1680), who became the outstanding theoretician and publicist of the movement. Nathan's public faith in Sabbatai never wavered. Sabbatai's proclamation of himself as the Messiah in 1665 electrified Jewish communities from Hamburg to Yemen. Many Jews sold all of their possessions to journey to Israel in order to participate in the Messianic events. The Sabbatean movement was bitterly divisive, as polemics between Sabbatean and anti-Sabbatean rabbis and scholars grew harsher. Sabbatianism developed strongly antinomian elements, as Sabbatai publicly broke Jewish law and proclaimed that much of the law did not apply to the time of the Messiah. Many Sabbatians, however, ignored Sabbatai's antinomianism and viewed the Messianic era as calling Jews to a stricter observance of the Law.

The Sabbatian claims to Messiahhood challenged Ottoman authority over Jerusalem and its environs. Sabbatian attitudes toward the Ottoman rulers were ambiguous, as the sultan appears as both an ally and an enemy in Sabbatian literature. In 1666 the Ottoman authorities gave Sabbatai the alternatives of conversion to Islam or death. Sabbatai chose conversion and received a pension from the sultan. However, Sabbatai continued to present himself as a Jew in some circumstances, and the mistrustful Ottomans eventually imprisoned him. He died in Ottoman captivity.

Although Sabbatai's conversion horrified most of his Jewish followers and caused them to abandon their messianic hopes, it did not mean the end of the Sabbatian movement. Sabbatai's apostasy was explained by Nathan and others

in Lurianic terms as the Messiah's descent into the lowest non-Jewish depths in order to redeem them. Many of Sabbatai's followers, including Sarah but not Nathan, followed him into Islam. They formed a community known as the *Donmeh* that lasted into the early twentieth century, outwardly practicing Islam while maintaining a Jewish identity. Sabbatianism also persisted among the Jews of Christian Europe, operating underground but attracting the loyalty of some of the most eminent rabbis of the late seventeenth century and the eighteenth century. The controversy between Rabbi Jacob Emden (1697–1776) and Rabbi Jonathan Eybeschütz (1690–1764), whom Emden accused of being a secret Sabbatian, involved numerous Jewish leaders as well as Christian political authorities. Some Sabbatians immigrated to Israel.

The Sabbatean movement also attracted the interest of European Christians, who hoped that it would prove to be a path into Christianity for Sabbatai's followers or at least a blow at the Ottoman empire. Christian millenarians also saw Sabbatai's movement as a sign of the end of the world. After Sabbatai's conversion to Islam, Christian missionaries hoped to use the collapse of the movement to discredit Judaism in the eyes of Jews, a policy that had some successes. Christian writers also used Sabbatianism to ridicule apocalyptic and millenarian hopes among Christians as well as the foolishness of the Jews.

A succession of messiahs claimed to be the successors or the reincarnations of Sabbatai Zvi. Barukiah Russo (d. 1720 or 1721) preached an antinomian version of Sabbatianism asserting that the existing Torah was the Torah of the lowest realm and that the Torah of the highest realm permits or even commands those acts forbidden by the lower Torah. The most important of the eighteenth-century successors of Sabbatai was the Polish Jew Jacob Frank, who came into contact with Sabbatians while trading in the Ottoman empire. He claimed to be the reincarnation of King David as well as of Sabbatai. Under pressure from Polish authorities, Frank converted to Catholicism in 1759, but he and his followers who converted, like the *Donmeh*, retained a Jewish identity.

Catholic Crusaders in Imperial Service

The legacy of the crusades against the Muslims helped shape the ideology of conquest for the Spanish and Portuguese empires. The huge extent of the early modern Islamic world meant that Spanish and Portuguese explorers and conquerors could encounter Muslims at many places in Eurasia, Africa and their offshore islands, and when these encounters became hostile, as they often did, they could be viewed as extensions of the crusade. The crusades that played the most important role in early European expansion were not the medieval crusades in the Middle East, but the “reconquista,” the slow process extending over centuries by which the Iberian peninsula, the home of the most important early imperial nations, Spain and Portugal, had been regained for Christendom. The reconquista was completed in 1492 with the defeat and annexation of the Emirate of Granada, the last Islamic state in Spain. This effort, which drew on warriors from all over Spain, helped foster a common Spanish identity around the holy war. The same year Columbus set forth on the first of his voyages. He presented his voyage in a crusading context, suggesting that the wealth won from a new route to the Indies could then be applied to the recovery of Jerusalem.

There was some interest in extending the reconquista to Islamic North Africa, and Spain acquired a few strongholds in the region, including the town of Oran. (The Portuguese had actually preceded the Spanish as crusaders in Africa, with the conquest of Ceuta in 1415.) However, despite Isabel of Castile’s urging her heirs in her testament to relentlessly carry on the conquest

of Africa it never became a major area of Spanish effort. The main focus of Spanish expansionism in the sixteenth century was the new world and later the Philippines. Spanish aggression was justified in the name of spreading true religion, and Spanish conquest was followed by the destruction of temples, the slaughter of indigenous priests and the suppression of indigenous cults. Native American religion was identified with devil-worship. The destruction of indigenous religion (some of its elements, however, were also amalgamated) was complemented by the creation of a Catholic church on the Spanish model, with a parish and diocesan organization as well as religious orders, notably the Franciscans and later the Jesuits, and an Inquisition modeled on Spain’s. The leading role Spain played in the wars against European Protestants and the Islamic Ottoman empire reinforced the crusading image, although the principal Spanish orders of crusading knights, the Orders of Santiago, Calatrava,

➤ CAMÕES’S *OS LUSIADAS*, A CRUSADING EPIC

One example of the importance of the Crusading ideology in how European expansion was presented was the epic poem written in 1572, *Os Lusíadas* (Or *The Lusiads* in English), of the Portuguese poet Luis Vaz de Camões (1524–1580). *Os Lusíadas*, whose name is derived from the ancient tribe that resided in the region of Portugal named the Lusitanians during the Roman empire, is an epic poem that revolves around the historical successes of the Portuguese people, using Vasco da Gama’s expedition to the Indian Ocean as the central theme, and is generally considered the greatest epic poem written in Portuguese. Camões, who had spent some time in the East, presented da Gama and the Portuguese in general as motivated by the causes of winning honor and advancing Christianity rather than the trade issues that were actually uppermost in Portuguese exploration. Camões managed to combine the presentation of the Portuguese as Crusaders fighting Muslims in the Indian Ocean with an extensive use of the Olympian pantheon for plot machinery inspired by the epics of Homer and Virgil.

and Alcantara mostly fell into inactivity following the conquest of Granada and Pope Adrian VI's decree bestowing their grand masterships on the Spanish monarch in perpetuity in 1522.

The Portuguese also drew upon crusading ideology, but their African and Indian Ocean empire was considerably more precarious. The outright destruction of indigenous religions was not practicable in most circumstances, and the Portuguese were forced to treat these religions with varying degrees of tolerance. However, Islam remained the chief enemy, and the Portuguese attitude towards it was usually more hostile than that displayed to Hinduism, Buddhism or the indigenous African religions.

The Order of Christ, a Portuguese crusading order founded after the suppression of the Templars, played the most prominent role of any military order in the first wave of European expansion. Prince Henry “the Navigator” (1394–1460) was its grand master from 1417 and the Order of Christ was the foundation of much of his power and wealth. It received extensive administrative powers over the early Portuguese colonies in the Atlantic Ocean, including Madeira, and would later receive tax money from both African and Indian trade. Vasco da Gama, the first captain to circumnavigate Africa, was a member, transferring from his original membership in the autonomous Portuguese branch of the Order of Santiago, whose role in Portuguese overseas expansion was waning. Other members of the Order of Christ significant in early Portuguese exploration include Don Francisco de Almeida and Pedro Alvares Cabral, the discoverer of Brazil. However, the Order was declining in both Portugal and its empire by the mid-sixteenth century.

The ideology of crusading could also be employed to present conquest as “noble”—not motivated by material gain. However, imperial actions could also be judged by religious standards and found wanting. Spanish Dominican friar Bartolomeo de las Casas (1484–1566) agreed with Spanish imperialists that Spain had been given the New World by God in order to advance true religion, but went on to claim that Spanish greed and brutality had forfeited this title and that Spanish “crusaders” were driving Natives farther from Christianity through their bad example.

Quetzalcoatl and the Virgin— The Patois of Indigenous Religion and Imposed Catholicism

The conversion of the Native American population was one of the moral justifications for the Spanish conquest of North America. Spanish Catholic missionaries baptized tens of thousands of indigenous people in mass conversions, although critics, especially in Protestant denominations, wondered how committed the new Christians were to their faith. They complained that the native peoples merely grafted traditional rituals and beliefs of their former religion onto Christian practices. The peoples of preconquest Mesoamerica had followed a well-defined religious system in which a myriad of gods existed, each with its own special purpose. They organized spectacular rituals and sacrifices to honor each god and ask for specific favors, and they regarded particular sites as sacred to the gods, building elaborate temples and holding complex ceremonies there. Quetzalcoatl, the Feathered Serpent, the best known of the gods worshipped by the peoples within the Aztec empire, was deemed the patron of creation, learning, and knowledge. When the Spaniards conquered Tenochtitlan, the Catholic priests who accompanied the conquistadores were anxious to destroy all remnants of the native religion and convert the indigenous peoples. They especially feared that the local people would try to retain their old faith as much as possible. Those who were found to worship the old gods risked execution or imprisonment. To speed the conversion process, many of the priests learned the Nahuatl language, under the rational assumption that speaking to the people in their own tongue would make it easier to teach them about Christianity.

Surprisingly, the Christian missionaries found many similarities between Christianity

THE LADY OF GUADALUPE

According to legend, Mary, the Lady of Guadalupe, appeared on December 9, 1531, on Tepeyac Hill outside of present-day Mexico City to Juan Diego, a Chicemeca Indian, who had been baptized and was on his way to Mass. She asked him to go to the bishop and ask for a shrine to be built at the site. The bishop did not believe that Juan Diego and asked for proof. On December 12 the Lady appeared again and told Juan Diego to pick roses, which he would find on a hill, and take them to the bishop. Even though it was winter, the flowers were blooming. When Juan Diego poured the roses out of his cloak before the bishop, an image of the Lady was printed on the garment. A church was built at the site in 1533, and Juan Diego was canonized as a saint in 2002.

The story appealed to the Christianized Indians of Mexico because it blended aspects of their traditional religion with the Christianity introduced and often imposed by the Spaniards. The Lady appeared at a place believed to have been sacred

to the ancient Mesoamerican goddess Tonantzin, the goddess of sustenance. Moreover, the Virgin's image that appeared on Juan Diego's cloak had the coloring, features, and dress of a pregnant Indian woman. Guadalupe is believed to come from the Nahuatl *Coatlaxopeuh*, which means "Who Crushes the Serpent," and in Christian iconography, Mary is often depicted as crushing the devil, who appears as a serpent. Thus, the image had a double meaning for the Indians of Central Mexico, since one of their most popular god, Quetzalcoatl, was represented as a feathered serpent.

Some Spanish Catholic churchmen and officials resisted acknowledging this apparition as genuine because of the manner in which many local natives continued to associate the Virgin with Tonantzin, but in 1754 the Roman papacy officially declared *Nuestra Señora la Virgen de Guadalupe* to be the heavenly patroness of New Spain.

—Timothy J. Watts

and indigenous religious traditions. Some priests were able to build on these similarities and ease the conversion process. As a result, Christianity in Mexico assumed many of the outward aspects of the preconquistador faith. There was nothing unique about this phenomenon, however, because Christian missionaries, wherever they went, had been marrying their faith with local cultural traditions, especially religious traditions, since Christianity's earliest days.

The similarities between the religious traditions of Mesoamerica and Christianity included a belief in an afterlife. The native peoples had believed that the souls of those who died would go to different places, depending on the way they died and their burial. They also believed in the concept of confessing one's sins, and once sins were forgiven, it was then possible for a soul to reach paradise. Like many Christians, Mesoamericans believed in self-sacrifice to honor their gods. Instead of the self-flagellation found in Catholic Europe at this time, Mesoamerican nobles pierced different parts of their own bodies to shed life-giving blood. Religious processions were also important rituals

in both religious traditions. Images of the gods or saints or other religious artifacts were carried with pomp and music through the streets. The missionaries also found it useful to build their churches on the sites of former native temples, as had been the case as well in antiquity when Christianity triumphed in the Roman empire, Ethiopia, and elsewhere. Finally, Christian saints came to be viewed by the converted natives as comparable to their ancient deities. The Christian tendency, for example, to assign saints as the patrons of particular professions or activities was not unlike practices that went back to the origins of civilization in Mesoamerica.

In brief, the ability of the native peoples to see similarities between their old religious beliefs and customs and Christianity helped ease the conquest of Mexico.

The Jesuit Relations

The *Jesuit Relations*, published in France from 1632 to 1673, were a series of annual reports from the Roman Catholic Jesuit missions in the lands claimed by France in North America. The *Relations* were a product of the hierarchical and centralized Jesuit system. Missionaries were required to produce an annual report on their missions for the Jesuit superior in New France. The superior edited and compiled the most important information from these reports into a

summary to his superior, the provincial of the Jesuits in France. In France, Paris publisher Sebastian Cramoisy printed the *Relations* in a series of duodecimo volumes. In addition to the *Relations* proper, numerous other accounts from the North American Jesuits were published in France and Italy in French, Latin, and Italian.

The first volume was produced in the wake of the return of French power and Jesuit missions to Canada in 1632 after a brief period of English occupation. The author was the newly appointed head of the Jesuit mission in Quebec, Father Paul le Jeune. Le Jeune remained the sole author for the next two *Relations* as well. The first *Relation* to appear in the form of a compilation of missionary reports was that for 1635, much of which was devoted to a report from the mission among the Huron tribe.

The *Relations* were written as an appeal to French Catholics in hopes of gathering the political and financial support that was essential for the maintenance of the missions. They called for support also for specific projects such as schools and hospitals for both French colonists and Native Americans. For this purpose, the *Relations* placed the missionary effort in a positive light, emphasizing the heroism and piety of the missionaries, the nobility of the Native American converts, and the marvels wrought by God to protect and extend the missions. Military metaphors were scattered profusely throughout the *Relations*, with the Jesuits cast in the role of brave soldiers assaulting Satan's strongholds in the New World. Although stories of the conversion and baptism of Native Americans were common, so too were accounts of the resistance to Christianity offered by many Native American individuals and groups and the torture and martyrdom of Jesuits at the hands of Native Americans, particularly the Iroquois. Leaders of traditional Native American religion, stigmatized in propaganda as sorcerers who, like the witches of Europe, derived their power from the Devil, were the villains of many stories. Their spells were often portrayed as ineffective in comparison to the prayers of the Jesuits and they themselves as victims of God's providential punishment.

Not all Jesuits reported in the same way. Some of the *Relations*, particularly in the early years, were rich in material concerning the

► BLACK ROBES—JESUITS IN CANADA

The Society of Jesus was the most important Catholic missionary order in French North America. The beginnings of the Jesuit mission were modest; two Jesuits arrived from France in 1611, but their efforts found little success, as they were captured by the English. A somewhat larger group arrived in 1625, but they were carried off by the English, who temporarily drove the French out of Canada. The permanent mission was established in 1632 when the French government put the Jesuits in charge of the overall missionary effort to the Native Americans.

Jesuits, referred to by the Natives as Black Robes after their distinctive garments, established themselves among many native communities. In addition to striving for the conversion and baptism of Native Americans, Jesuits worked to advance French interests against France's Dutch and English rivals. Jesuits also strove to convert seminomadic natives to sedentary agricultural life in the belief that this would render them more amenable to Christian conversion. The arrival of the Jesuits in Native American communities was often disruptive, as the Europeans carried numerous diseases to which the natives had little immunity. Jesuits identified as disease carriers or captured by hostile natives often suffered painful martyrdoms in retaliation.

—William E. Burns

languages, religion, customs, lifeways, and organization of Native American communities, knowledge gathered by Jesuits living among largely non-Christian Native Americans. Other accounts focused on conversions and the building of Christian communities among the Native Americans and advocated the Jesuit policy of encouraging seminomadic Native American groups to form sedentary communities. The *Relations* also included information on the natural history of North America with both descriptions of the animals and allegorical interpretations, such as the stink of the skunk is likened to the stink of sin. The *Relations* remain the most important written source for knowledge of Native American communities in the seventeenth century.

The mission of the French Jesuits was political as well as religious, and the *Relations* emphasized the good that the missions were doing for the power of France in North America as well as for the Church. Important events in the history of the French community at Quebec were recounted, with praise for those French Canadians who supported the missions. The Protestant English and Dutch were shown not merely as rivals for the souls of Native Americans but as threats to French power (particularly when allied with the Iroquois).

The published series of *Relations* came to an end with the papal effort to centralize the dissemination of missionary accounts by requiring permission for their publication. The Jesuits were caught between Rome and the French authorities, who were very reluctant to acknowledge papal authority over French publications. By seeking permission from Rome to publish, the Jesuits would anger the French authorities, and the simplest remedy was to simply cease publication. The cessation of the published series did not immediately result in the end of the compilation of manuscript *Relations*, which continued for several years in the hope that the printed series could be resumed.

The Praying Indians

During the early 1600s American Indians came into contact with European fishermen, explorers, and later colonists. In response, the Indian developed a variety of strategies for surviving the dramatic social and environmental changes that contact brought. These survival strategies ranged from resistance to European intrusion into their lands to assimilation (absorption) into colonial societies. The particular response that a tribe developed depended upon the intensity of contact.

For the peoples of southeastern New England—the Narragansett, Wampanoag, Massachusetts, and Pennacook tribes—the choice of a survival strategy was influenced by both the waves of European settlers and the waves of epidemics that assaulted them during the 1600s. For centuries, native peoples had been separated from contact with Europeans. Consequently, they had no natural resistance to European diseases such as measles, pneumonia, influenza, and smallpox. These diseases decimated villages, disrupted basic patterns of living, and undermined tribal values and institutions. As much as 90 percent of some villages along the New England coast were depopulated. The terrors of recurrent epidemic fundamentally transformed American Indian culture, eroding the integrity of its core values and disrupting its essential social institutions.

By the 1640s demoralized remnants had begun efforts to adapt to their changed world. In the Puritan stronghold of Massachusetts Bay Colony, a conversion movement gained momentum through the autumn of 1646 as small bands of Massachusetts and Wampanoag people who lived near English settlements took time from their daily rounds to hear ministers preach from the book of the powerful English God.

Puritan missionary John Eliot preaches to Native Americans, 1651. (Library of Congress)

From Roxbury, the Reverend John Eliot emerged as the most active of the Puritan missionaries. After a failed attempt to preach to the village of Cutshamekin, the most influential of the Massachusetts sachems, Eliot staged a second try at Nonanetum, near Cambridge, on October 28. This audience was more receptive. The Nonanetum remnants saw in Calvinist imagery—the anger of a vindictive Jehovah, sin and retribution, redemption of the elect—an explanation for the traumatic events that afflicted them. Leaders of the conversion movement sought to adopt certain English principles of order without integrating themselves fully into colonial society. Their strategy—acculturation—was a middle way between resistance and assimilation. Eliot called those who accepted the Puritan view of their experience Praying Indians.

Those who became Praying Indians were active participants in the acculturation process. Remnant leaders pressured Eliot to establish a Praying Town distant from both colonists and traditionalist tribes. Over the summer of 1650 they relocated to Natick, 18 miles (29 kilometers) west of Boston. By 1675 they had organized, and the colony's legislature had legitimized, 14 Praying Towns. These remnant communities were not entirely “new canoes,” as one

leader observed. Composites of birch bark and clapboard, the Praying Towns were not wholly Indian, not wholly English. All retained distinguishing indigenous customs. Some boasted a meetinghouse and one or several clapboard houses built after English fashion. Most residents preferred their familiar wigwam, the foreign structures “being more chargeable to build and not so warm, and cannot be removed so easily.” The traditional palisade fort protected their villages from enemy raiding parties by surrounding their wigwams within a wall of tree trunks sunk into the ground. On Assembly Days—occasions of special ceremony in the Puritan Commonwealth—the community gathered to the beat of the drum, English bells being expensive. As ancient hunting trails receded farther from the center of missionary influence at Natick, fewer and weaker Puritan practices marked the Praying Towns. The people of Punkapog, living just south of Boston and “advantaged by” an adjacent cedar swamp, adapted to the market relations of the colony's capital by selling shingles and clapboards. Forty miles (64 kilometers) to the north, however, the congregation of the Praying Town at Wamesit could be neither persuaded nor cajoled to exploit their productive fishing station and their ample herds of horses for the colonial market.

Until 1675 there was potential for inclusion of the converts in colonial society. Although relegated to the margins of social intercourse, the Massachusetts were gradually adapting to the new world created by colonial occupation and alien disease. But the potential for acculturation dissipated with the outbreak of Metacomet's War, the most destructive conflict in American history. Metacomet became sachem, or leader, of the Wampanoag in 1662. Efforts by Plymouth Colony to dominate his people led him to plot a general uprising against English colonists, allying with other tribes.

From the beginning of hostilities, most Praying Indians sided with the Puritans. Time and again they alerted colonial authorities to impending attacks, although their warnings were often ignored; other Praying Indians served as spies, scouts, and soldiers throughout the war. Even so, “the animosity and rage of the common people” erupted against the Praying Towns,

which were easy and accessible targets. In October 1675 after a dilapidated Dedham building caught fire, local militia surrounded Natick, marched its 200 residents to the Charles River, and escorted them to Deer Island in Boston Harbor. They were soon joined by others. As the number of refugees increased to about 500 over the winter, the magistrates funneled some to nearby Long Island.

Conditions in the barren, bleak, and windswept internment camps were miserable as dysentery and other illnesses swept the camps. By February 1676 it seems that hundreds had died. Anxious to demonstrate their loyalty, Praying Indians asked permission to organize a military troop; the platoon formed in time to see service against Metacomet's assault on Sudbury later that month.

Their participation contributed significantly to shift the tide of war to favor the colony's armies. In the closing days of the insurrection, as exhausted Wampanoag warriors struggled to elude colonial armies, Praying Indian scouts enabled a colonial expedition to track down and kill Metacomet himself. By the middle of May the General Court ordered the return of Praying Indian refugees from the Boston Harbor islands to the mainland. But the damage was done. The war reduced their populations considerably through conflict, atrocities, exposure, malnutrition, and disease. The war won, the General Court reduced the number of Praying Towns to just four.

In time, covetous English neighbors succeeded in absorbing the convert communities. Remnants once again, the praying people shifted for themselves, bereft of all but the barest support from the Puritan community. Recurrent pestilence, particularly smallpox, continued to compromise the remnants' survival. In 1678 the population of the first Praying Town was estimated at 212. By 1753 only 75–100 persons, gathered in 25 families, remained. At the end of the French and Indian War, only 37 Massachusetts were left. Finally, in 1855, the town of Natick reported only 1 living descendant of the Massachusetts Praying Indians.

The history of the Praying Indians established a precedent in relations between American Indians and European settlers. Europeans,

and later Americans, would follow the example laid down in the aftermath of Metacomet's War, subordinating their own laws and institutional missions to the imperative of economic development and material gain and exiling the Indians to the bleak recesses of marginality.

Conjure

Conjure is the name for an African American magical system. Also known as tricking, goopher, mojo, and, since the late nineteenth century, hoodoo, it has long been a living link between black Americans and their African roots. Though most often found in the South, it has existed throughout the United States wherever a significant black population has settled.

Conjure began its history during the seventeenth century, with the rise of the British North American slave trade into the Atlantic Coast colonies. The African regions from which the unwilling laborers came were to influence its development enormously. In the Chesapeake, the African population was quite mixed, though by far the largest single ethnicity were the Igbo of the Bight of Biafra region of West Africa. Like most Africans and many Europeans of the day, the Igbo were firm believers in charms and spells. In Virginia, poisons were the most common weapon of the conjurer. Conceived of as spiritual instead of simply toxic substances, they

THE CONJURE TRADE

Whatever era they have inhabited, conjurers have been important people. Antebellum conjure men promised—and reportedly delivered—relief from the lash. After emancipation, African Americans needed money in addition to protection. Conjurers offered their magical assistance. Their versatility, coupled with a widespread belief in their powers, made many famous. Conjure men and women like Aunt Caroline Dye, Dr. Buzzard, and Dr. Jim Jordan are still talked about today. Some of them succeeded in doing more than building name recognition. Jim Jordan, for instance, used his conjure trade to build a large fortune, charging some customers thousands of dollars for his services. By the time he died in 1962, he had used his earnings to purchase several other businesses and to support a community of many dozens that grew up around his rural North Carolina shop. Scholars and popular authors, black and white alike, have often dismissed conjurers as mere superstitious charlatans. Clearly, they have been wrong.

—Jeffrey Elton Anderson

were an integral part of Igbo beliefs as well. The Igbo's American descendants turned to poisons to punish enemies and even cruel masters. The term *mojo*, used either as a synonym for conjure or as a designation of a type of charm, may be another Africanism introduced by the Igbo.

Though Igbo's were an early and persistent presence in the Chesapeake, the contributions of people of west-central African descent cannot be overlooked. Slaves of Kongo, Angolan, and related ethnicities were a numerical majority of South Carolina and Georgia's black population. One of their most obvious contributions was the heavy use of graveyard dirt, sometimes known as goopher dust, in their charms. Goopher appears to derive from the Kongo word *kufwa*, meaning "to die." This focus on the dead arose from west-central Africans' religious veneration for ancestral spirits, which was considerably stronger among the Kongo and related peoples than with most other Africans. Another west-central African import was the widespread use

of roots in conjure charms, a practice in keeping with the beliefs of the slaves' homeland.

Though the preceding practices and terms are but a few of the African features of conjure, one thing that sets it apart from hoodoo, its Mississippi River Valley cousin, is the absence of many of the latter's overtly African features. Hoodoo, as the magical and ceremonial aspect of Voodoo, relied on a variety of African deities and specific spirits of the dead. Such practices were rare in the rest of the South, at least by the nineteenth century. Even African words, though present, were far less common in conjure than in hoodoo. By the nineteenth century, the most common names for the practice, including conjure itself, were English. Goopher doctor was an exception to the general rule. In place of the missing Africanisms were Europeanisms. Practitioners were sometimes known as cunning men and women and high men and women, English terms for magic workers. Likewise, Bibles had become powerful conjure tools well before the end of slavery, and prayers to the Christian God had supplanted the deities. Though English terms and concepts strongly influenced conjure, it had in no way ceased to be African. On the contrary, it had become African American.

Historically, conjure men and women were vital components of this magical system. These were supernatural specialists who worked for paying clients, selling charms and spells tailored to meet their clients' needs for love, luck, money, revenge, or virtually anything else they might request. Prior to the first half of the twentieth century, practitioners gathered most of their magical materials from nature. Their best-known curios were John the Conqueror roots, five finger grass, black cat bones, devil's shoe string, and Chewing John roots. During the antebellum era, some of the conjurers' most popular products were designed to help slaves avoid punishment or successfully run away.

The Quaker Experience in Early America

The Society of Friends, or Quakers, originated in the religious ferment of mid-seventeenth-century England. Its early leaders included George Fox (1624–1691), generally viewed as the founder of the movement, and Margaret Fell (1614–1702). Quaker characteristics included the shunning of a professional ministry and a liturgy, plain dress, the refusal to take oaths or show deference by such customs as removing one's hat in the presence of a social superior, and pacifism. Quakers viewed the “Inner Light”—the subjective experience of the Holy Spirit—as the ultimate source of religious truth rather than the authority of a hierarchy or the Bible. The sacraments, including the Eucharist and Baptism, were interpreted in a spiritual rather than material sense. Like other radical Protestants of the seventeenth century, early Quakers believed that the Second Coming was near but often identified it as a return of the spirit of Christ in men and women rather than a physical return of Jesus to rule over the world. Quakers were suspicious of religious learning and elaborate theologies. Much Quaker group worship took place in silence. The term “Quaker” was originally bestowed by the movement's enemies in reference to the trembling

before God characteristic of many Quaker worshippers, particularly women. Quakerism was also marked by a higher degree of gender equality than other early modern European religious movements and was one of the few to encourage women to become missionaries. Quakers saw themselves as a people apart and generally married within their own community. Early Quakers were confrontational, challenging established religious forces from the Church of England to the Congregationalist Puritans of New England. Quaker missionaries even witnessed to the pope and the sultan of the Ottoman empire.

Quakers began to arrive in America shortly after the founding of the movement in England. They were persecuted in America as they were in England. Four Quakers were hanged in Boston from 1659 to 1661. Virginia also passed anti-Quaker laws. Many early American Quakers gravitated to Roger Williams's religiously tolerant Rhode Island. The General Meeting held there in 1661 was the beginning of the New England Yearly Meeting, the oldest Quaker yearly meeting in the world.

American Quakerism was transformed by the founding of the Quaker colony of Pennsylvania, named after its founder, the English Quaker William Penn (1644–1718). Penn received a charter for about 45,000 square miles (116,550 square kilometers) of American land from King Charles II on March 4, 1681. About 10,000 Quakers arrived in Pennsylvania over the next two decades, many of them from the north and the Midlands of England, the movement's heartland. Pennsylvania's capital of Philadelphia became the center of American Quakerism, and the Philadelphia Yearly Meeting, established in 1681, became its leading body. The Yearly Meeting was composed of delegates from local weekly, monthly, and quarterly meetings, an organizational model pioneered in England. Pennsylvania was deliberately founded as a “Holy Experiment” that would epitomize Quaker values. It was religiously tolerant, which is a central Quaker value and one that would help attract settlers. Penn also worked to win acceptance for his new colony from Native Americans nonviolently, a most unusual practice in the English colonial context. Reflecting Quaker egalitarianism, the colony also featured

➤ A QUAKER MARTYR, MARY DYER

Mary Dyer was one of New England's most notorious heretics. In 1637 Dyer joined with a woman named Anne Hutchinson and became involved in what would become known as the Antinomian Heresy, which was based on the belief that faith alone was what was required to achieve salvation. This was a more extreme belief than what the mainstream Protestants believed, because the Antinomians believed that the Mosaic law of the Old Testament was completely unnecessary. These radical beliefs caused the expulsion of Hutchinson, Dyer, and her husband William from Boston for heresy in 1637. After Dyer's expulsion, it was discovered that she had given birth to a deformed stillborn child, and Governor Winthrop ordered that it be exhumed. The corpse was depicted by her enemies as a "monster" and in their eyes showed God's wrath toward her.

William and Mary Dyer traveled to England in 1652, and it was here that Mary heard George Fox, the founder of the Society of Friends, preach. Feeling that the values of the Quakers were closely aligned with the Antinomians, Dyer joined the Quaker church and became a preacher before returning to Rhode Island in 1657, where she had lived after her expulsion from Boston. In 1658 Dyer heard of a proposed law in Massachusetts

that would ban Quakers, and this caused her to travel to Boston in order to protest the proposed law. This led to her imprisonment and expulsion from the Massachusetts colony. After her second expulsion, Dyer continued her missionary efforts as she traveled throughout New England and was arrested again in New Haven, Connecticut. She then returned to Boston again to visit her friends William Robinson and Marmaduke Stevenson, who had been imprisoned. This caused yet another arrest and this time permanent expulsion from the colony. Dyer defied this expulsion again by returning with a group of Quakers to protest the law. This time she was arrested and sentenced to death, although she received a last-minute reprieve, as her husband was friends with Governor John Winthrop. This reprieve carried with it the condition that she go back to Rhode Island and never return to Massachusetts. Dyer returned to Boston in the late spring of 1660, probably on a deliberate quest for martyrdom. This time she found no mercy and was hanged on Boston Common on June 1, 1660. Robinson, Stevenson, and William Leddra also were hanged and, along with Dyer, became known in Quaker tradition as the Boston Martyrs.

—William E. Burns

manhood suffrage rather than the imposition of a property or religious qualification for the vote.

As Quakers established themselves in Pennsylvania, they became more tolerated in other colonies and less confrontational to other forms of religion. Philadelphia became a center of education and social amelioration, with the founding of the Friends Alms House in 1729. It was joined in 1767 by the Bettering House, a combination of a workhouse for the poor and an alms-house for the disabled and elderly founded by Quaker merchants.

As Pennsylvania grew more religiously plural in the eighteenth century, attracting settlers from many areas of the British Isles and Germany, the Quakers increasingly had to share power with others. Even in Philadelphia, Quaker control was increasingly contested by Anglican and Presbyterian factions. Quakers themselves were politically, although not religiously, divided between one

faction supporting Penn's heirs, the Proprietary faction, and the Antiproprietary faction opposing them. Quakers were also increasingly divided on class lines, as many feared that prosperous Quakers were falling prey to the temptations of worldliness. A shared pacifism helped Quakers build alliances with some Pennsylvania groups of German origin, such as the Moravians, but the increasing involvement of the colonies in transatlantic wars, beginning with the Nine Years' War from 1688 to 1697, posed ultimately insoluble problems for Quaker resistance to war and militarism. Many saw the Quakers as hypocrites, benefiting from the efforts that others made to protect the colony while not participating in its defense themselves. Quaker members of the Pennsylvania Legislature resigned en masse in 1756 rather than vote taxes for the French and Indian War, dealing a blow to Quaker political power in Pennsylvania from which it never recovered.

Tensions between Quaker Philadelphia and the frontier population, much of it of Scots-Irish descent, became a major factor in Pennsylvania politics. The Paxton Boys, a group of Scots-Irish Presbyterian frontiersmen, murdered peaceful Conestoga Indians in December 1763 and marched in arms on Philadelphia the following month, further widening the gulf between Quakers and non-Quaker Pennsylvanians. Supporters of the Paxton Boys attacked the Quakers as hypocritical allies of bloodthirsty natives, while opponents defended the Quakers and portrayed the Paxton Boys as murderous cowards and religious fanatics. The Paxton Boys' massacre marked the end of William Penn's experiment in peaceful coexistence between European settlers and Native Americans.

Outside Pennsylvania, there was also a substantial Quaker community in western New Jersey centered around the city of Burlington. Although there was no overall Quaker hierarchy, American Quakers retained close connections with their fellow Quakers in England. By the mid-eighteenth century the transatlantic Quaker community was in the vanguard of the antislavery movement. In 1754 the Philadelphia Yearly Meeting denounced slavery, the first American religious body to do so. This was part of an internal struggle between Quaker abolitionists and Quaker slave owners.

The Adoption of Crusade Ideology in Mesoamerica

Many motives drove Christopher Columbus to sail west toward the Indies, but one purpose that drove the westward voyage of this complex and often inconsistent man was the dream of

converting the Great Khan of Cathay and joining with him in a final, great, and successful crusade against Islam, which in turn would usher in even greater events. In his so-called *Book of Prophecies*, a compilation of texts prepared essentially between 1501 and 1505 for the Catholic monarchs of Spain, Fernando and Isabel, the master mariner placed the discovery of the Indies into the grand divine plan for the forthcoming salvation of all humanity, the Final Judgment, and the End of Time. He argued that his voyage to the west had been the first step in the process of liberating Jerusalem, itself a necessary step in the unfolding of God's plan of universal salvation. Leaving aside the issue of whether or not he actually believed these messianic prophecies (and it seems clear that he did), it is clear that Columbus was appealing to a widespread belief that the road to Jerusalem lay through the Indies. After all, he was appealing to two crusaders, the Catholic Monarchs Isabel and Fernando, who had conquered Granada on January 2, 1492, and who saw victory over the last Muslim stronghold in the Iberian Peninsula as another stepping stone in their God-sanctioned struggle against Islam, a struggle that was foreordained to result in triumph.

Even after it became clear that Columbus had not sailed to the Indies, at least some European churchmen continued to harbor the hope that the lands and peoples of the Americas would be the means for the liberation of Jerusalem and the destruction of Islam, and they apparently imparted that dream to at least some of their Indian converts. Festivals celebrating the victory of Christians over Moors became an integral part of Catholic religious culture throughout Latin America wherever Spanish and Portuguese missionaries brought the faith after 1492. Among these were the Tlaxcalans, whose religious pageants offer an important example of how thoroughly Catholic Christianity was assimilated in the New World.

The Tlaxcalans, themselves Nahuatl but nevertheless traditional enemies of the Mexica and their Aztec empire, had been defeated by Hernan Cortés in September 1519, and following that defeat they allied with the Spaniards in their march against the Aztec empire. Thousands of Tlaxcalans participated in the fighting and proved to be a decisive factor in the Spanish

➤ A TLAXCALAN LIENZO—“WHEN THEY BAPTIZED THE LEADERS”

The image depicts the baptism of four Tlaxcalan rulers. Beneath the image of the Virgin Mary and Jesus, four male leaders kneel and receive the Eucharistic host of holy communion from a priest. Three noble Tlaxcalans, probably women, stand behind the priest, and behind them are three Spanish soldiers. Cortés dominates the upper register on our right and holds a crucifix and a book, presumably a Bible or book of prayer. To his left stands Doña Marina, his translator and lover, without whose aid he never would have succeeded in the conquest of Mexico. Behind them stand another Spaniard and a row of seven lances. The *lienzo* supposedly shows the conquest in chronological sequence, but we know from Spanish sources that these nobles were baptized only after the *la noche triste* (the Night of Sorrow) of either June 30 or July 10, 1520, when the Spaniards and their Tlaxcalan allies were driven out of Tenochtitlan with heavy losses.

—Alfred J. Andrea

(The Art Archive)

victory. A number of Cortés's lieutenants married Tlaxcalan women of high birth, and despite initial reluctance to give up their ancestral deities, the Tlaxcalan chiefs were baptized as Christians sometime after July 1, 1520.

Mock battle pageants between “Christians and Moors” had been a popular expression of Reconquest realities and ideology in the Iberian Peninsula since at least the late thirteenth century. Now they were translated to the New World and its Christian converts.

We are fortunate to have a description of a Corpus Christi pageant performed by the Christian Indians of Tlaxcala in 1539 to celebrate the peace treaty between Emperor Charles V and the king of France and recorded shortly thereafter by the Franciscan missionary Fray Toribio de Benevente Motolinía in his *History of the Indians of New Spain*. In this elaborate pageant, which was composed at least in part by the Tlaxcalans but clearly with the help of their Franciscan mentors, the playwrights portrayed the future conquest of Jerusalem by the combined armies of Charles V's European possessions and New Spain and the consequent baptism of its

presumed occupier, the Muslim sultan of Cairo (although, in fact, Jerusalem had passed into Ottoman hands in December 1516).

Significantly, the pageant included several large and spirited mock battles, which apparently served to underscore the fact that holy war and the festivals that celebrated divinely mandated conflict and bloodshed were as much a part of this new religion of the Tlaxcalans as they had been when they and other Mesoamerican tribes conducted “Flower Wars,” preconquest battles fought for the purpose of capturing enemy warriors who were then sacrificed to a local deity. Often the sacrifice was either preceded by or took the form of a mock battle, when the captive was given an ineffective wooden sword with which to battle a fully armed adversary.

The most striking aspect of this pageant and its mock battles is that all of the combined crusader forces, European and Indian, fail to take Jerusalem despite their bravery. The Christians only succeed when the combined Indian forces of New Spain are joined in the fray by a heavenly patron on a brown horse, Hippolytus, a third-century soldier-saint on whose feast day, August

13, 1521, the Spaniards and their Tlaxcalan allies had captured Tenochtitlan. Indeed, just as the Tlaxcalans are led by Saint Hippolytus, the Spaniards, who now sweep to victory alongside these new Christians, are led by Santiago Matamoros—Saint James the Moor-slayer—on a horse “as white as snow.” Significantly, Santiago was the patron-saint of the Reconquista, the crusading wars of reconquest waged by Christian Iberians against the Muslims of Spain from roughly the mid-eleventh century to late fifteenth century.

According to legend, the apostle Saint James the Greater, whose relics were believed to have been miraculously transported to Compostela in northwest Spain, had initially appeared to lead the Christian forces of Asturias to victory at the mythic Battle of Clavijo in 844. He was also the namesake of the Order of Santiago, the most powerful of the Iberian military orders, founded in 1170 in León. Significantly, Hernan Cortés, the conqueror of Mexico, belonged to that order, as did many of his subordinates. And we are told by the sources that these conquistadors regularly shouted out the traditional Spanish battle cry, “Señor Santiago,” as they went into battle in the Americas.

The meaning of this Tlaxcalan pageant is clear. There is every reason to conclude that the Tlaxcalans were anxious to present themselves, and fellow Nahuatl converts to Catholicism (including their former enemies, the Mexica), as latter-day crusaders and as having accepted totally the Spanish crusading ethos despite whatever animosities they still harbored against their conquerors.

Moreover, the Tlaxcalans were fully aware, as were the Spaniards, that Cortés’s small army of Spanish soldiers could never have conquered

the Aztec empire without the tens of thousands of Indian allies who marched with him, and chief among these were warriors from Tlaxcala. As a consequence, Tlaxcala became a privileged, largely self-governing province under Spanish colonial rule and was showered with honors and privileges.

The ideology of crusade was such a driving force in the Spanish conquest of Mexico that even the conquered and converted felt it necessary to claim identity with it. And what sort of crusade was that? By 1500, indeed well before that date, the crusade had metamorphosed into a struggle of apocalyptic proportions and with deep millenarian overtones. Put simply, it was a global, even cosmological, struggle between Catholic Christendom and Islam, heresy, heathenism, unbelief, and every manner of error, which included the “heathen errors and practices” of preconquest Mesoamerica.

■ Introduction: New Sites of Intellectual Inquiry

The early modern period was marked by the rise of a more organized and state-directed intellectual life in many areas of the globe and by a partial globalization of knowledge that increased demands on intellectuals.

One reason for the institutionalization of intellectual life was the rise of centralized

powerful states with an interest in advancing a specific ideology and controlling the interpretation of that ideology. In East Asia, the Ming and Qing dynasties of China, the Korean Joseon dynasty, and Japan’s Tokugawa shoguns based much of their legitimacy on Confucianism. For the Chinese government, the study of the

classics in the approved fashion was necessary for recruitment of civil servants. The Ottoman empire sought much of its legitimacy in the sultan's role of Islamic leader and integrated the ulama, the class of Islamic experts, into the state much more closely than had previous Islamic regimes. Islamic education was vital in this project, and the founding of madrasas were a way for the sultan and other Ottoman leaders to demonstrate piety. In Christian Europe the universities, both ancient like the universities of Paris and Oxford and newly founded like Leiden in the Dutch Republic, played an essential role in the process of Catholic and Protestant reform. European universities and the new universities of the European colonies in America served the state by providing much of the personnel for state churches and the legal and medical professions.

The Europeans faced the greatest intellectual challenge in integrating the new information coming in from all over the globe. The European encounter with the Americas led to a flood of new knowledge of land, people, plants, minerals, and animals. The discovery of the sea route to the Indian Ocean and ultimately East Asia led to vastly increased contacts with old civilizations, with their own rich intellectual traditions. Europeans responded by developing the most geographically far-flung intellectual associations to that date, Roman Catholic religious orders, notably the globe-spanning Jesuits, and the network of scientific societies that began to emerge in the late seventeenth century, led by England's Royal Society and France's Royal Academy of Sciences. European states also developed intellectual communities more narrowly focused on other regions, such as the Casa de Indio of Portugal and the Casa de Contratacion that compiled much of the information on the western sea route for Spain. By the late eighteenth century there were thriving voluntary intellectual communities based in European colonies, such as the British Orientalists in India or the American Philosophical Society in colonial Philadelphia.

From the examination halls of Qing China to the madrasas of Istanbul to the meetings of the American Philosophical Society, organized intellectual life was male. Those few women who participated, such as Bologna's Laura Bassi, were

recognized as highly exceptional. However, less formal groups, such as the salons of Enlightenment Paris, offered a greater scope for female participation. It was perhaps not a coincidence that the salons offered an alternative to the role of the intellectual as servant of the state and church, a model of the critical intellectual.

—William E. Burns

The White Deer Cave Academy—Confucianism in Japan

Although Neo-Confucianism was recognized as Japan's official form of scholarship, it was not the only form of Confucian learning in Tokugawa Japan (1603–1867). Without an examination system for the recruitment of government officials as existed in China, the Japanese had more freedom to criticize Neo-Confucianism, resulting in new fields of scholarship (such as Dutch Learning and National Learning) and alternative forms of Confucianism. Thus, there were two other major schools of Confucian thought: the school of Ancient Learning, especially the teachings of Ogyū Sorai (1666–1728), and an interesting group of scholars known as the Eclectics, represented by Inoue Kinga (1732–1784).

There were three main forms of Neo-Confucianism during the Tokugawa period. In 1640 the Tokugawa government established an academy for the study of Neo-Confucianism, and its first director was Hayashi Razan (1583–1657). Unlike the previous Muromachi era (1333–1573), warfare was not rampant during the Tokugawa period. Thus, samurai warriors found their martial skills less relevant in an era of peace. The purpose of the academy was the training of samurai for service in the fledgling Tokugawa government. A rival of Razan, Yamazaki Ansai (1618–1682), established his own private academy in Kyoto. Although Ansai dedicated himself to Neo-Confucianism, he had a more doctrinaire and even devotional view of it than Razan. Specifically, Ansai believed that he had a spiritual relationship with the greatest of the Neo-Confucians in China, Chu Hsi (1130–1200), whose school was called the White Deer Cave Academy. In this scheme Ansai asserted that the one true Neo-Confucian orthodoxy was transmitted to him alone, essentially bypassing

all other scholars—Chinese, Japanese, and Korean—over the intervening four centuries, including Hayashi Razan and his students. Ansai was so obsessed with his possession of orthodoxy that he eventually turned to Shinto ideas in an effort to prove that the Japanese were Confucian before Confucianism was actually imported into Japan from China.

The final form of Neo-Confucian learning was the Wang Yang-ming (Yōmei in Japanese) school. Wang Yang-ming (1472–1528) was a Chinese official who believed that the Neo-Confucian emphasis on study and memorization of the Confucian classics came at the expense of introspective self-examination. Although the Neo-Confucians advocated meditation, they maintained that the study of the classics was the *sine qua non* for any scholar. Wang Yang-ming inverted this hierarchy and encouraged his students to focus on their own hearts in order to fathom the principle (*li* in Chinese, *ri* in Japanese) of the cosmos. After ascertaining these universal truths, people were obliged to act on them in their daily lives. The teachings of Wang Yang-ming entered Japan during the Tokugawa period but did not attract as many adherents as either of the other two forms of Neo-Confucianism.

In response to the dominance of Neo-Confucianism, two alternative forms of Confucianism developed in Tokugawa Japan. The first to develop was the Ancient Learning school of thought. Although the scholars associated with Ancient Learning did not form a school in any formal sense, there were beliefs that they all shared. First, they believed that the Neo-Confucian interpretations of the Confucian canon (the *Four Books* and the *Five Classics*) were tainted with influences from Taoism and Ch'an (Zen in Japanese) Buddhism that they found unacceptable. Neo-Confucian interpretations therefore distorted the meaning of the original texts. Second, scholars could only apprehend the original meaning of ancient Confucianism by reading the canonical texts without the aid of Neo-Confucian glosses. Finally, scholars of Ancient Learning were critical of the passivity and quietism of Neo-Confucianism in favor of active individual practices. The most important of the Ancient Learning scholars was Ogyū Sorai, considered by

YAMAZAKI ANSAI, *REGULATIONS FOR THE SCHOOL OF THE WHITE DEER CAVE*

In this excerpt, Yamazaki Ansai explains the rules of Chu Hsi's academy. He first examines Chu Hsi's interpretation of the Five Relationships, which were central to Confucianism, before discussing the role of a Confucian education.

"Between parent and child there is intimacy.
Between lord and minister there is duty.
Between husband and wife there is differentiation.
Between elder and junior there is precedence.
Between friend and friend there is fidelity.

These five articles of teaching are what [the sage-kings] Yao and Shun commanded Ch'i, the Minister of Education, solemnly to promulgate as the five subjects of teaching. All that the student should study is contained in these five regulations. . . . In speech be loyal and true; in action be conscientious and reverent. Subdue ire and stifle passion. Change yourself for the better; do not hesitate to correct your errors. . . . Do not do to others what you do not care for yourself. When action fails to get results, seek the reason for failure in yourself. . . . The aim of teaching and guidance given by the ancient sages and scholars, it seems to me, is nothing more than to set forth moral principles, in order, first, to cultivate them in one's own person, and then to extend them to others. Simply to accumulate knowledge and learn to write well in order to gain fame and a well-paid position is far from being the true function of education."

—Mark McNally

Excerpt of *Regulations for the School of the White Deer Cave* by Yamazaki Ansai, taken from *Sources of Japanese Tradition*, Vol. 1, 1st ed., compiled by Ryusaku Tsunoda et al. (New York: Columbia University Press, 1958), 356–357.

many to be Japan's Machiavelli for his emphasis on distinguishing personal morality from effective political control. The Neo-Confucians, of course, believed that morality and politics were tightly bound together; Sorai argued that personal morality was irrelevant to the ability of the ruler to govern well.

Scholars identified as the Eclectics (*setchūga-kusha*) comprised still another major Confucian alternative to Neo-Confucianism. During the eighteenth and nineteenth centuries these were scholars who tried to combine the emphasis on practice in Ancient Learning with the personal morality of Neo-Confucianism. One of the first to attempt such a blending was Inoue Kinga. Kinga studied Neo-Confucianism, including the teachings of Wang Yang-ming, and became the student of one of Ogyū Sorai's disciples before he founded his own private academy. Kinga encouraged his students to study the various forms of Confucianism and draw their own conclusions without the slavish devotion to a particular teacher, which he believed characterized the students of Sorai.

The Madrasas of Ottoman Istanbul

The Ottoman empire saw a close institutional relationship between Islamic education and the state, with few precedents in Islamic history. Central to this relationship were the leading madrasas of the capital city of Istanbul, formerly Constantinople.

The construction of madrasas, schools of Islamic religious and legal studies, in newly conquered territories had a long Ottoman history. The earliest recorded instance is Sultan Orhan I's (r. 1326–1359) foundation of a madrasa in Nicea shortly after its conquest in 1331. Constantinople was different from other Ottoman territories with long Islamic histories, where Ottoman foundations coexisted with previously existing Islamic institutions. The Christian city of Constantinople was a blank slate Islamically. As Islamic rulers, Ottoman sultans were obliged to create a religious infrastructure, of which educational and intellectual institutions were an

important part. The conquest of Constantinople in 1453 by Ottoman forces under the leadership of Sultan Mehmed II (r. 1451–1481) was followed by the founding of several new madrasas as part of Mehmed's program of remaking the city into an Islamic capital. Some of the new madrasas were founded in old Byzantine buildings, but the sultan also had 16 new madrasas founded as part of the new Fatih mosque complex. These were divided into 8 major and 8 minor madrasas, the major madrasas becoming known as the Sahn madrasas. Their charter included a requirement that their teachers be expert in the "ancient" sciences, such as astronomy and mathematics, as well as the "religious" sciences, such as the study of the Quran and Islamic law and traditions.

Unlike the madrasas of the Seljuks or previous Islamic regimes in Asia Minor, Ottoman madrasas were ranked in a hierarchy according to how much their heads were paid. At the lowest level were those where the head received a daily fee of 20 *akces*. Sahn madrasas were in the second-to-the-highest financial class, as their heads received 50 *akces*. Fifty-*akce* madrasas were further divided into three classes, in ascending order *haric*, *dabil*, and the Sahn madrasas themselves. Sahn madrasa heads also ranked ahead of sanjaks, provincial governors, in Ottoman protocol. The only higher-paying madrasa was the Ayasofya madrasa, built when Mehmed converted the Byzantine church of Hagia Sofia into a mosque. The head of the Ayasofya received 60 *akces*. The 60-*akce* madrasas were in the *altmisli* class. Several other *altmisli* madrasas would be built in Istanbul and elsewhere in the sixteenth century.

Sultan Bayazid II (r. 1481–1512) also sponsored the building of madrasas in Istanbul, but they did not rival the Sahn or the Ayasofya. The next major initiative in Istanbul was Suleiman I's (r. 1520–1566) construction of a new hilltop Islamic complex, the Suleimaniye, designed by the famous architect Sinan. Sultan Suleiman was by far the greatest builder of madrasas in the history of the Ottoman sultanate and was responsible for two Istanbul *altmisli* madrasas, the Sehzaade madrasa and the madrasa dedicated to Suleiman's father, Selim I (r. 1512–1520), also the work of Sinan. The Suleimaniye was designed as

➤ ABU- AL-QA-SIM ALA- AL-DIN ALI- IBN MUHAMMAD QUSHJI-ZADE (D. 1474)

One of the earliest noted scholars associated with Istanbul madrasas was the central Asian astronomer Abu- al-Qa-sim Ala- al-Din Ali- ibn Muhammad Qushji-zade (also referred to as Ali Kuscu). Possibly born in Samarkand, Qushji was part of the circle of astronomers associated with the observatory of Samarkand and its Timurid ruler, the astronomer-prince Ulugh Beg (d. 1449). Like many Islamic scientists, Qushji was a polymath, writing on physics, mathematics, philosophy, and theology as well as astronomy. In astronomy, he did theoretical work on the motion of Mercury and was head of observation at the Samarkand Observatory. As a physicist, Qushji questioned Aristotelian ideas about the nature of substance and suggested that the earth might be in motion. Qushji did not wish to replace Aristotelian natural philosophy with another philosophy as much as he wished to completely separate astronomy from natural philosophy. After the death of Ulugh Beg, Qushji traveled through the eastern Islamic world

and served different Muslim princes. The ruler of the White Sheep Turkmen of eastern Anatolia, Uzun Hasan (1423–1478), employed Qushji on an embassy to the Ottoman sultan Mehmed II in Istanbul. In 1472 Qushji and his family relocated permanently to the Ottoman capital.

In Istanbul, Qushji taught at the Sahn madrasas and subsequently at the Ayasofya madrasa, at that time the highest-paid position in the Ottoman madrasa system. Some scholars have argued that the emphasis on rational sciences in the Sahn madrasas in part reflects the influence of Qushji on Mehmed II. Although he was only in Istanbul for a short time before his death, Qushji had a major impact on Ottoman education through his students, his descendants who included the philosopher and mathematician Miram Celebi (1475–1525), and his many textbooks and commentaries, which became standard texts in Ottoman madrasas.

—William E. Burns

a show of Suleiman's power and glory as well as piety. In addition to six madrasas, the complex included the Suleimaniye mosque, to which the sultan and his retinue proceeded in state for Friday prayers, public baths, and a hospital and other charitable facilities. Religious sciences dominated at the Suleimaniye madrasas more than they had at Mehmed II's complex, in keeping with the Islamization of the Ottoman state under Suleiman and the growing emphasis on Sharia as the basis of Ottoman law. A madrasa was dedicated to each of the four Sunni schools of legal interpretation. The heads of these four madrasas received 60 akces per diem, putting them ahead of Mehmed II's Sahn madrasas. There were two specialized schools as well. The Darulhadis, a center for the study of *badith*, the traditions associated with Muhammad and his companions, came to be recognized as the highest-ranking madrasa in the empire. Its teacher received 100 akces per day. There was also a medical madrasa, the Dar al-tibb, but its head received only 20 akces, reinforcing the dominance of religious learning in the Ottoman madrasa system. (The Dar al-tibb also only supported 8

students, as opposed to the 15 of the four general madrasas and the Darulhadis.)

The Suleimaniye madrasas were formally integrated into the Ottoman state through the requirement that their heads meet with the grand vizier after prayers on Friday and with the Shaykh al-Islam, the empire's top religious official, on Thursdays. Ottoman madrasas were also essential to the recruitment of religious officials throughout the empire such as the religious judges, or *kadis*, of the major cities. The connection between madrasa teaching and the holding of religious offices became formalized with the creation of a system of connections between which teaching at a particular level of madrasa was associated with promotion to a particular level of religious office. Teaching at a high-level madrasa, preferably in Istanbul, became a prerequisite for the highest Ottoman religious offices such as Shaykh al-Islam.

The madrasas of the Fatih and Suleimaniye complexes and the other madrasas founded by sultans and members of the imperial family were only the tip of the iceberg. In addition to the many madrasas found in Anatolian cities such

as Bursa and Edirne, some of great reputation, Istanbul had well over 100 madrasas. Subjects studied at Ottoman madrasas included the Arabic language, including its grammar and syntax; the Quran; hadith; theology; elocution; rhetoric and preaching; and the principles and application of jurisprudence. Instruction was by a small group method whereby about a dozen students resident at the madrasa read and discussed the material with the instructor.

Although subsequent sultans built madrasas, none rivaled the earlier sultans as madrasa builders. By the late sixteenth century there was a widespread perception among Ottomans that the madrasas were declining due to corruption and nepotism. Some posts of madrasa head became sinecures, held by persons who never actually taught but instead hired scholars at miserable wages to teach the actual classes. The hierarchy of madrasas also became more rigid and elaborate.

Universities as Centers of European Learning

A revolution in education took place during the European Renaissance that challenged but did not eliminate the medieval scholastic university curriculum based on logic and Christianity. The transition from Europe's Middle Ages to the Renaissance through scholars like Francesco Petrarca, Leonardo Bruni, Lorenzo Valla, and others is essentially the development and acceptance of Renaissance humanism. Humanism was an intellectual movement and educational program that eventually spread to various courts

and centers of learning all over Europe. The program was known as the *studia humanitatis*, or humanistic studies, and was based on the study of Latin grammar, rhetoric, history, poetry, and moral philosophy. Its origins began in Italy in the cities of Florence and Venice and among the ruling families of Milan, Urbino, Mantua, and Ferrara. Humanism tended to be an urban movement that found a home in republics, princely courts, and some universities and schools.

Humanism was generally secular and distinct from the chivalric culture of the nobility and the academic culture of the clergy, although it should not be viewed as pacifistic, egalitarian, irreligious, or anti-Christian. Humanist scholars turned to the ancient civilizations of Rome and Greece to draw inspiration from their literature and history. Renaissance humanists read ancient writers to gain knowledge of moral philosophy and ethics as well as models of governance and behavior relevant to their world. Nevertheless, many humanist teachers and professors, such as Erasmus of Rotterdam, were deeply religious men who emphasized Christian piety and the study of acceptable classical pagan literature as complementary means for improving the moral standards of their age.

The term *umanista* was Italian student slang for teachers or students of the *studia humanitatis*, which seems to have been first used at the end of the fifteenth century. Vittorino da Feltre (1378–1446) was one of the most famous teachers to provide a humanistic curriculum at his grammar school, called the Casa Giocosa, at the court of Mantua in 1423 under the sponsorship of the Gonzaga family. Another famous fifteenth-century school was at the court of Ferrara and was led by Guarino Guarini (ca. 1374–1460) in the service of the Este family. Important teachers like Vittorino and Guarino helped to spread the *studia humanitatis* throughout Italian court culture. These men tended to stress a holistic approach to education by stressing both the physical and intellectual development of students. The training was intense and, some might argue, rather monotonous in terms of learning difficult ancient languages and grammar.

Although students read and studied Latin authors in the medieval curriculum, Renaissance teachers increasingly added humanist

➤ AN EARLY UNIVERSITY BUILDING BOOM

Sixty-three new universities were founded in Europe between 1400 and 1601, such as Turin (1411) and Parma (1601) in Italy, Nantes (1409) in France, St. Andrews (ca. 1410) in Scotland, Louvain (1426) in the Low Countries and Wittenberg in Germany in 1502, the home of Martin Luther's Protestant Reformation. The simple reason for this growth in centers of higher learning is that an increasing number of men wished to pursue a university education. In general, boys studied the traditional seven liberal arts (Latin grammar, Latin rhetoric, logic, arithmetic, geometry, musical theory, and astronomy), and ambitious students continued on to the higher faculties of law, medicine, and theology. Men with law degrees were in great demand from kings, princes, and cities that needed civil servants to contribute to the growth of bureaucracies. Students were instructed in Latin, and the

length of studies varied from 1 to 3 years for a Bachelor of Arts degree, 5 to 7 years for law and medical degrees, and 12 years for a doctorate in theology. Men with BAs who went on to teach at the university were granted an MA, the traditional license to teach the arts, the *Licentia docendi*. Although the degrees were basically similar throughout Europe, the approach to the subjects could vary from university to university. A typical university had 30 to 40 professors and 300 to 500 students. Ambitious students often studied at more than one university, and schools with humanist-based curricula were highly prized. Famous humanist professors could demand high salaries, and students wished to study under them because they believed that they would gain a better understanding of Latin and Greek.

—Mark Loudon

material with a new emphasis on classical style and oratory. Emphasis on pedagogical treatises from ancient thinkers such as Quintilian played a large role in changing Renaissance schooling. The pursuit of eloquence became a defining feature of Renaissance humanism, with its emphasis on the study of language and philology. Public speaking, rhetoric, the study of history, and learning moral philosophy were important components of Renaissance education for both the sons and daughters of Italy's elite ruling families and the middle classes. This education was extremely practical, for these children would someday participate in governing the various city-states of Italy. It is estimated that by the end of the fifteenth century nearly all Latin schools in Italy promoted a humanistic curriculum. The influence of Italian humanist educational ideals spread over the Alps into France, Germany, the Low Countries, Spain, England, and even Poland. A general increase in literacy throughout Italy and Europe led to the demand to increase the number of grammar schools and universities.

There were several new colleges founded at existing universities in these countries that promoted the introduction of classical studies into the existing curriculum. For example, in the first decades of the sixteenth century in England, the

universities of Oxford and Cambridge were endowed with new colleges whose founders encouraged the study of classical learning. English humanist scholars and patrons brought an eclectic experience derived from their studies in Italian schools or elsewhere on the continent. By the sixteenth century the term "humanist" signified a much broader meaning than a teacher of the liberal arts. This label could be applied to anyone who favored the new learning, and it came to denote cultural preference. The Renaissance University had three objectives: some professors produced new scholarship and even new ideas, they all taught their disciplines to students, and the university granted degrees to students that permitted them to teach their subjects throughout the Latin Christian world. By the sixteenth century students influenced by Renaissance education produced a cultured elite, consisting mostly of men but also of some women such as Isabella d'Este (1474–1539), who promoted the humanist educational program in Europe for several centuries to come.

Academies of Science in Europe

The seventeenth century saw the birth of a remarkable new institution, the scientific academy or society. Academies were originally structured gatherings of intellectuals and writers, sometimes linked to a court but independent of a university. Societies and academies differed from earlier informal gatherings of the learned in that they had written rules, met on a fixed schedule, had a roster of members, and had their own physical space. The origins of the academy were closely linked with humanism and were strongest in Italy, the heartland of humanism. The famous Platonic Academy of Florence in the late fifteenth century actively disseminated Neoplatonic philosophy. The scientific academy emerged in the seventeenth century, again originally in Italy. Rome's shadowy Academy of the Lincei or "Lynxes," the private project of the botanist Prince Federico Cesi (1585–1630), existed in various forms from 1603 to 1629 and was noteworthy for the participation of Galileo Galilei. The first academy devoted to experimentation, the Academy of Experiment, was sponsored by the Grand Duke of Tuscany and lasted from 1657 to 1667. By the late seventeenth century the most important European scientific societies by far were the Royal Society in England, chartered in 1662, and the Royal Academy of Sciences in Paris, founded in 1666.

The new societies had a much stronger institutional and corporate existence no longer dependent on a particular patron or intellectual leader and were much more closely tied to the state than their predecessors. The Royal Society and the Royal Academy were permanent institutions located in capitals of large kingdoms and flaunted their royal patronage in their names. They had libraries and collections and were often charged with government functions such as

overseeing observatories or advising the government on scientific and technological projects, often those related to economic development. Despite these similarities, they represented fundamentally different models.

The Royal Society, lacking state funding, had male-gender upper-class social status (rather broadly defined) and an interest in natural philosophy as sufficient qualifications for membership. It was funded by dues, which it often had trouble collecting. The Royal Society did not have a fixed number of members and lacked an internal hierarchy among its fellows, all of whom were theoretically equal. Institutions following the Royal Society model dominated the British Isles, Britain's American colonies, and the Dutch Republic, but the French Royal Academy proved more influential in French provincial societies and elsewhere on the European continent. The Royal Academy was a professional body whose members were limited in number, were ranked and paid a salary by the state, and were expected to produce scholarship that would redound to its glory and profit.

One significant similarity was that neither the Royal Society nor the Royal Academy imposed a religious test on members, promoting an idea of science as nonsectarian. Catholic Sir Kenelm Digby was an early member of the Royal Society in Protestant Britain, and Dutch Protestant Christiaan Huygens was a member of the Royal Academy in Catholic France. (The Royal Society would admit its first Jewish fellow, Emanuel Mendes da Costa, in 1747.) The German philosopher Gottfried Wilhelm Leibniz (1646–1716), a great believer in scientific organization, promoted the establishment of academies on the French model in Berlin, the capital of Prussia (founded in 1700), and St. Petersburg, the capital of Russia (founded in 1724 after Leibniz's death). These academies were originally mostly staffed by French and other west European scientists. Along with the Swedish Academy at Stockholm, founded in 1739, the academies and societies of France, Britain, Prussia, and Russia would lead European science in the eighteenth century. They were followed by a host of lesser societies in the provinces or in smaller states.

Academies and societies, not universities, dominated institutional science in the

► WOMEN AT THE BOLOGNA ACADEMY OF SCIENCES

Bologna, home of the University of Bologna, was a leading center of natural study in Italy, located in the Papal States. However, a permanent academy was founded only in 1714 as part of the university, with five salaried professorships for scholars expected to do research and publish. The academy was supported by the Senate of Bologna and the pope. It was expanded and put on a sounder financial footing by Pope Benedict XIV (1740–1758), a native of Bologna. Benedict expanded the class of paid academicians expected to publish and endowed the academy with revenues derived from suppression of a school for the poor.

Like other scientific societies, the Bologna Academy published a journal and contributed to joint astronomical observations. Despite Benedict's ambition, it had little impact outside Italy. The academy did not offer prizes, which was one way that provincial societies could attract interest in other parts of Europe, and suffered with the rise of new Italian scientific centers in Pavia and Turin.

One unique way in which the Bologna Academy sought to distinguish itself was by including women. The most noted was the University of Bologna physics professor Laura Bassi (1711–1778), who by the time of her death was the highest-paid member of the academy. The academy also looked outside Italy to recruit distinguished women who could not hope to be admitted to scientific organizations in their own countries. The French Newtonian Emilie Du Chatelet was admitted to the academy in 1746. Other women invited to join included the mathematician Maria Gaetana Agnesi (1718–1799), although she never formally accepted the invitation or came to Bologna. Two more women were admitted in the early nineteenth century: the obstetrician Maria Dalle Donne (1776–1842) in 1800 and the Greek professor Clara Tambaroni in 1802. The academy closed in 1804.

—William E. Burns

eighteenth century. The man almost universally acknowledged as Europe's greatest scientist, Isaac Newton (1642–1727), was president of the Royal Society from 1703 until his death. Membership in a scientific society, or preferably several, was vital for establishing the credentials of Europe's male scientists, and memberships were frequently listed after the author's name on the title pages of books. (Women, with very few exceptions, mostly Italian, were barred from membership.) The most important scientific periodicals were associated with scientific societies, including the Royal Society's *Philosophical Transactions* and the Royal Academy's monthly *Journal des Savants* and annual *Histoires and Memoirs*. Major societies and many minor ones also sponsored periodical publications and set problems for prize competitions. Scientific societies were only part of Europe's vast and growing array of learned institutions, and often a scientific society existed as one part of a large academy devoted to other topics as well, such as literature and industry. Groups specifically and exclusively devoted to science were usually found where there was a large concentration of

resources, such as the national capitals of Europe's most powerful states. Other specialized societies, such as societies for medicine, technology, agriculture, and economic development, also had scientific interests.

Communication and cooperation between scientific societies also grew in the first half of the eighteenth century, a process in which the Royal Society and the Imperial Academy of St. Petersburg were the leaders. Communication was mostly in the form of correspondence and the exchange of publications. Serious cooperation in joint scientific endeavors began in the 1750s and 1760s, and the worldwide campaign to observe the transits of Venus in 1761 and 1769 brought in every leading scientific society and many of the minor ones to sponsor expeditions and make and record observations.

The second half of the eighteenth century saw a wave of society creation, as European civic leaders believed that a society was essential to the prestige of their cities. Several societies were formed in Germany. The Göttingen Academy, closely connected with its university, was founded in 1752, followed by the Erfurt Academy

in 1754 and the Bavarian Academy of Sciences in Munich in 1759. The first enduring American society, the American Philosophical Society, was founded in 1768. The formal chartering of a scientific society often occurred after years of organization and informal meetings of local scientific investigators, indicating the vitality of scientific culture in eighteenth-century Europe.

The Jesuits and Intellectual Inquiry

The Society of Jesus, or Jesuits, a Roman Catholic religious order, was founded by a Spanish soldier-turned-priest Ignatius Loyola (1495–1556) and his small band of followers. The group was recognized by Pope Paul III (1534–1549) in 1540. From the beginning, the Jesuits were an intellectually elite order, and in a few decades their schools and universities throughout Europe and its colonies numbered in the hundreds. Intellectual inquiry was an important part of the Jesuit mission, but it was rigidly subordinated to authority both within the order and within the Catholic Church as a whole.

Intellectual inquiry played many roles in the Jesuit mission. Jesuit schools and colleges were ubiquitous in Catholic Europe, and even Protestants drew on the excellent Jesuit textbooks. Jesuit education was marked by a curriculum that combined humanism and scholasticism. Although the Jesuits were not founded to combat the Protestantism that had spread through most

of Europe in the preceding decades, they were quickly identified with the Catholic struggle. Intellectual combat with Protestant polemicists required vast knowledge and research in theology, philosophy, the Bible, and Church history. Jesuit champions included the theologian Robert Cardinal Bellarmine (1542–1621), the author of massive and erudite books defending the Catholic position, and Francisco de Suarez (1548–1617), a profoundly original theologian in the scholastic tradition who spent much of his career at Spanish Jesuit colleges. Another role was service to the administrative needs of the Church. The Jesuit astronomer and professor Christoph Clavius (1537–1612) led in the creation of the Gregorian Calendar, proclaimed by Pope Gregory XIII (pope during 1572–1585). Jesuit intellectual expertise also made them valuable to many Catholic and non-Catholic sovereigns, from the Chinese emperor Kangxi (r. 1661–1722) who drew on Jesuit cartographic skills to map his kingdom to the European rulers who relied on Jesuit institutions to train mathematicians and navigators.

One of the most intellectually demanding areas of Jesuit work was the missionary field. Along with other Catholic missionary orders, Jesuits were present on every inhabited continent except Australia, of which Europeans were ignorant. In “civil” societies with cities and written literature such as China and Japan, the Jesuits followed a distinctive strategy that required engagement with the intellectual and religious traditions of the social elites they were trying to convert. Jesuit missionaries sometimes even adopted indigenous lifestyles: Robert de Nobili (1577–1656) lived as a south Indian religious ascetic, and Matteo Ricci (1552–1610) lived as a Chinese Confucian intellectual. This required deep study of foreign languages, literature, and cultures. The Jesuits were responsible for the first presentation of Confucian texts in Latin, *Sapientia Sinica* (Chinese Wisdom, 1662), the first of a number of Jesuit-mediated Confucian texts that would appear in European languages in the late seventeenth century, as well as the first presentation of Aristotelian philosophy in Chinese, *Studies to Exhaustively Master Principles* (1683).

While Jesuits in the Americas had far less interest in the high culture of the peoples they

lived among, they produced a steady stream of works, from Jose de Acosta's *Natural and Moral History of the Indies* (1590) to Francesco Saverio Clavijero's four-volume *Ancient History of Mexico* (1780–1781). As the Jesuits increasingly drew from the Creole population of American-born Spaniards, by the eighteenth century their scholarship grew increasingly patriotic, defending the fertility of their lands and the greatness of their Pre-Columbian civilizations from the attacks of “enlightened” Europeans.

By 1750, the Jesuits had around 270 mission stations scattered over the globe. As missionaries, they both taught Western science and gathered information for Western scientists. Their worldwide reach was unparalleled until the rise of scientific societies in the eighteenth century. It was the Jesuits who introduced quinine, a cure for malaria, from South America to Europe. In one of the first efforts at global coordination of data gathering, the French priest and astronomer Marin Mersenne (1588–1648), a member of the rival Minim order, urged the Jesuits to make coordinated observations of lunar eclipses and magnetic variation. He recognized that only the Jesuits combined a global presence with the necessary training.

Jesuit inquiry was intended to serve the Church, not challenge it. Jesuits were required not just to defend Catholic doctrine but also to believe it. Jesuit authoritarianism did not merely apply to strictly religious matters. Although there was some intellectual pluralism among the early Jesuits, in 1611 General of the Order Claudio Aquaviva (1543–1615) decreed that Jesuits were required to defend the authority of Aristotle in philosophy. Jesuits were also required to support the theology of Thomas Aquinas. In the seventeenth century, Jesuits fell further and further behind other European scientists, Protestant and Catholic, who were free to reject Aristotle's authority.

The area where Jesuit authoritarianism most directly limited inquiry was astronomy, where Jesuits consistently defended geocentrism. In the trial of Galileo Galilei (1564–1642) in 1633, Jesuits, such as the astronomer and sunspot expert Christopher Scheiner (1573–1650), led the opposition, although it was the Dominicans who staffed the Roman Inquisition that eventually

➤ ATHANASIVS KIRCHER, S.J.

The German Athanasius Kircher (1602–1680) was the most distinguished and versatile Jesuit thinker of the mid-seventeenth century. Kircher entered the Society of Jesus in 1616 and was ordained a priest in 1628. In 1631 Kircher was driven from Germany by the Thirty Years' War. He was invited to Vienna in 1633 to be imperial mathematician to Holy Roman Emperor Ferdinand II but was diverted to Rome by the lure of papal patronage. Kircher became professor of mathematics and oriental languages at the Jesuit Collegio Romano. At Rome, Kircher was at the center of the worldwide Jesuit intellectual network and thus was in a unique position to gather information. He built an enormous museum in Rome, with objects from all over the known world, that became one of the glories of the city.

Kircher published over 40 books, many of them massively illustrated tomes of over 1,000 pages. Humanism, magnetism, optics, music, geology, fossils, Egyptology, astronomy, mathematics, chemistry, and Sinology did not exhaust his interests. *The Subterranean World* (1665) theorized that earthquakes and volcanic eruptions were caused by a network of underground fires. On a trip to Sicily, Kircher had witnessed an eruption of Etna and climbed to the edge of Vesuvius, inspiring his study of nature. Kircher's *Magnetism, or the Magnetic Art* (1665), contained a scheme for measuring a magnet's strength by using a balance. For example, *Magnetism* concluded with the discussion of God as “Nature's magnet.” Kircher's most famous work was his study of hieroglyphics, which he treated as complex symbols revealing ancient holy truths known to the Egyptians. Kircher was among the first to treat the Coptic language as relevant to Egyptology in his *Introduction to Coptic, or Egyptian* (1636). His Egyptian studies were given to the world in the massive *Oedipus Aegyptiacus* (1652–1654), which made Kircher a European celebrity.

—William E. Burns

passed judgment on Galileo. Seventeenth-century Jesuits shifted from Ptolemy's purely earth-centered system to the Danish astronomer Tycho Brahe's version in which the sun rotated around the earth and the other planets around the sun. However, as astronomers, including

some Catholic astronomers, increasingly accepted the Copernican sun-centered system, Jesuits were less able to participate in theoretical discussions, while they continued to lead in some areas of observational astronomy.

Although the grip of Church authority gradually lessened in the eighteenth century, the Jesuits were increasingly marginalized as new intellectual forces, such as the European network of scientific academies, took a more prominent role. Jesuits combated the Enlightenment as they had once combated Protestantism, even though many of its champions had been educated at Jesuit schools. The high-powered journal of French Jesuits, the *Journal des Trevoux*, ably defended Catholic orthodoxy against both the Enlightenment and the Catholic Jansenist movement. Jesuit inquiry was also limited by many Catholic governments turning against them and expelling them from their kingdoms and possessions. This attack culminated in the suppression of the Society of Jesus in 1773.

Salons, Women, and the Spread of the Enlightenment

The salon was a characteristic institution of the French Enlightenment. It had roots in the early seventeenth century, when the idea had originally been imported from Italian Renaissance courts. A model for early salons was the polished mixed-gender conversational culture found in Baldassar Castiglione's *Book of the Courtier*. Salons were a way of introducing the courtly

refinement characteristic of the Italian elite to the comparatively crude French court. (Catherine de Vivonne, the Marquise de Rambouillet [1588–1665], one of the earliest and most influential hostesses, had an Italian mother.) Salons were held on a weekly or biweekly basis in a space specifically set aside for the purpose. The seventeenth-century salon space was richly decorated, with mirrors, comfortable armchairs, porcelain, and an emphasis on refinement. Gatherings were held for the purpose of conversation, which had to follow certain forms in terms of vocabulary and forms of address. The purification of the French language was one of the missions of the early salons. Salons were sponsored and regulated by hostesses, upper-class women. They provided some space for female intellectual activity, and although few seventeenth-century French salon hostesses themselves wrote, they sometimes fostered female talent such as the novelist Madeline de Scudery (1607–1701), who was a member of the Rambouillet circle before becoming a salon hostess herself. The growth of female intellectual activity and the opposition it aroused from men can be seen in two plays of the popular French comic playwright Molière (1622–1673) ridiculing educated women, *Les Precieuses Ridicules* (1659) and *Les Femmes Savantes* (1672). Both were quite successful as plays and were considered classics of French literature, but they did not stop the growth of salons and women's intellectual culture.

The late seventeenth century saw the increased popularity of the “mechanical philosophy” of René Descartes (1596–1650). Cartesianism legitimated female intellectualism by claiming that souls were genderless although housed in bodies that were male or female, contributing to the spread of intellectualism among upper-class women. Cartesianism also has an advantage in that it is expressed in elegant French that women could read rather than the ponderous Latin of the Scholastic philosophers or Descartes's rival Pierre Gassendi (1592–1655), which restricted itself to an educated male readership. (It was at the urging of a salon hostess, Madame de la Salbière, that François Bernier produced his *Abridgement of the Philosophy of Gassendi*, which made the philosopher's thought available in French.) Descartes himself had friendships with several

THE ENLIGHTENMENT IN THE 18TH CENTURY

learned women and claimed that one reason he wrote in French was to be read by women. Since it was highly unusual for a woman to be educated in Latin, the spread of serious literature in vernacular languages opened up intellectual life to female participation and was in turn promoted by salon hostesses and other female intellectuals. Although some salon women had reservations about Descartes's approach to living things as machines, Cartesianism swept the salons in the second half of the seventeenth century, one key in its victory in French culture as a whole.

The intellectual salon of the eighteenth century, basically a Parisian phenomenon, was less aristocratic and less concerned with the refinement of manners and language than its seventeenth-century predecessors. It was a place where male middle-class and noble intellectuals

could meet on a basis of social equality and where the hostess was a gatekeeper, determining who was admitted and acting as a facilitator of introductions and an authority, keeping the conversation under control. (There were occasional male-run salons, but they were very much the exception.) Running a salon was a substantial commitment of time, energy, and money. Would-be salon hostesses were drawn from the social and economic elite and often attended other salons, sometimes for decades, before opening their own. Salon hostesses were also often intellectual celebrities in their own right, particularly in the medium of correspondence, often seen as more appropriate for a woman than writing directly for publication. Parisian salons made an important contribution to the culture of the Enlightenment, and admittance to a

► EMILIE DU CHATELET, A WOMAN OF THE FRENCH ENLIGHTENMENT

Emilie du Chatelet (1706–1749) was a leader in eighteenth-century French physics. Born into an aristocratic family, du Chatelet was exposed to French intellectual culture in her mother's salon. By the early 1730s du Chatelet was permanently settled in Paris, where she frequented salons and, with the acquiescence of her tolerant husband, began a series of affairs with leading thinkers, including the physicist Pierre-Louis Moreau de Maupertuis (1698–1759) and Voltaire (1694–1778), whom she met in 1733. Voltaire drafted du Chatelet, whose mathematical skills far exceeded his own, into his campaign for the replacement of Cartesian physics with that of Isaac Newton (1642–1727). Du Chatelet and Voltaire operated from a base at Cirey, a rural estate. There the two carried on experiments and worked on their writings. Du Chatelet's grasp of mathematics made her assistance vital to Voltaire in writing his Newtonian textbook, *Elements of the Philosophy of Newton* (1738). Du Chatelet's first published work, the anonymous *Institutes of Physics* (1740),

combined Newtonian ideas with some of those of Newton's rival, the German philosopher Gottfried Wilhelm Leibniz (1646–1716), such as *vis viva* (living force). (Voltaire was horrified at her respect for Leibniz, whom he loathed.) The work's anonymity was considered appropriate for the work of a woman. However, in the early 1640s du Chatelet also carried on a public controversy with Dortous de Mairan (1678–1771), the secretary of the Royal Academy of Sciences, over the formula for momentum. Du Chatelet's other significant work was a French translation of Newton's *Mathematical Principles of Natural Philosophy* (1687), drawing on a number of editions, commentaries, and popularizations of Newton. It included a commentary incorporating work done on mathematical physics since Newton's time. It was completed in 1749, shortly before du Chatelet's death in childbirth, but was not published until 1759 and remains the only translation of Newton's masterpiece into French.

—William E. Burns

salon was an important step in the career of the young Parisian professional intellectual. In addition to the prestige of salon membership, the salon was a good place to read one's works, circulate manuscripts, and facilitate contacts. Certain salon hostesses were influential in securing admittance to the Parisian academies, such as the French Academy and the Royal Academy of Sciences. At the other end of the scale, hostesses competed for the major intellectual stars who would lend glamour to their salons. When Julie de L'Espinasse (1732–1776) left the salon of the Marquise de Deffand (1697–1780) to establish her own, she took with her one of Deffand's stars, the mathematician and writer Jean le Rond d'Alembert (1717–1783), leading to a violent split with Deffand and a close relationship with d'Alembert. Many male visitors to Paris, such as David Hume (1711–1776) and Benjamin Franklin (1709–1770), were particularly delighted by the close female attention given to major intellectuals. This delight was not universal; Jean-Jacques Rousseau (1712–1778) came to despise the salon hostesses, whom he saw as having abandoned

the female duty of domestic life to corrupt the virtue of the male public with artificiality.

The salon was one of the few institutional venues for freedom of speech in Old Regime France. Salon culture was generally identified with the Enlightenment against its conservative opponents. Within this broad consensus, salons were often identified with an intellectual or political party. Suzanne Necker's (1737–1794) salon helped advance the career of her husband, the Genevan banker Jacques Necker (1732–1804). Not much evidence survives as to what people in salons actually talked about. There was somewhat less emphasis on the female intellectual contribution in the eighteenth century than in the seventeenth-century salons. The principal literary art followed by eighteenth-century salon hostesses was correspondence, and many of them became well known for their letters, which were intended to be circulated after being read by their recipient. Madame de Deffand's correspondence with the English writer Horace Walpole (1717–1797) is one example.

William King, Archbishop of Dublin

The career of William King (1650–1729) spanned the great upheaval in Irish society following the defeat by William, Prince of Orange, of James II during the Glorious Revolution (1688–1689), known in Ireland as the Williamite War. During the uprising King, then dean of St. Patrick's

Cathedral in Dublin, found himself one of only two senior clerics of the Church of Ireland still resident there. The demands of this situation heightened King's intellectual skills, honed his sense of Irish distinctiveness, and ultimately secured an Irish identity for a significant portion of the native Irish Protestant community. An immediate consequence of this was a flourishing, particularly in Dublin, of a vibrant Irish Anglican intellectual community that would produce such authors as Jonathan Swift, Oliver Goldsmith, and Edmund Burke.

Upon William's landing in England, Richard Talbot, earl of Tyrconnell and James II's viceroy in Ireland, essentially declared martial law and aggressively promoted

William King, Archbishop of Dublin during 1703–1729. (Mervyn Archdall, *Monasticon Hibernicum*, 1786)

➤ ARCHBISHOP WILLIAM KING AND THE ORIGIN OF EVIL

Archbishop William King wrote *Essay on the Origin of Evil* in 1702 in which he discusses evil and its role in the universe. In it, King said that evil was a natural part of the universe, put there by a benevolent God who wished people to attain their own virtue by having to battle against evil. This went against the traditional view of good and evil being equally powerful forces, pitted against each other in the battle for human souls. The essay created a controversy among theologians and philosophers alike and influenced the utilitarian movement in the eighteenth century.

“Why God has created Free Agents.

I. . . . 'Tis certain that God was not compell'd by any necessity to create any thing at all, he might therefore have prevented all Moral Evils, if he had not endow'd any Being with Free Choice; for so there would have been nothing that could sin. But such a monstrous Defect and *Hiatus* would have been left in Nature by this means, *viz.* by taking away all Free Agents, as would put the World into a worse Condition than that which it is in at present, with all the Moral Evils that attend it, tho' they were multiply'd to a much greater Number.

II. For in the first place, if we set aside Free Agents, *i.e.* those which have the Principle of Action within themselves, there is properly nothing at all Self-active, for all other Beings are merely passive: there is indeed some kind of Action in Matter, *viz.* Motion; but we know that it is passive even with regard to that; 'tis therefore the Action of God upon Matter, rather than of Matter itself; for it does not move itself, but is moved. Without Free Agents then the whole World would be a mere *Machine*, capable of being turn'd any Way by the Finger or Will of God, but able to effect nothing of itself. Nay the whole Work of God could not of itself exert one single Act or Thought, but it would be totally Brute and Stupid, as much as a Wheel or a Stone. . . . We need not say, how much a World thus constituted would be inferior to the present, not how in-commodious and unworthy of its Divine Author.”

—Christopher Fauske

Archbishop William King, *Essay on the Origin of Evil (De Origine Mali)* by Dr William King, Late Lord Archbishop of Dublin. Translated from the Latin . . . (London, 1731), 229–230.

the cause of the Catholic majority in Ireland. The majority of the members of the Church of Ireland with means fled to England. The ultimate success of William's forces, however, appeared to offer little comfort to the Church of Ireland, for victory had been secured almost entirely by anti-Episcopal Dutch Calvinist regular troops and Irish Presbyterians of Scottish descent who were demanding, at a minimum, that religious toleration be introduced in Ireland for all Protestants. In such a climate, the Church of Ireland needed a champion who could express himself with clarity and conviction. King emerged as such a champion. (Ironically, he was a convert from the Presbyterian faith of his father, a Scottish settler in Ireland.)

The publication that brought King to the attention of the public was his defense of the Anglicans who had remained in Ireland after 1688, *The State of the Protestants of Ireland* (1691). His argument had to carefully thread defending the Irish Anglicans' apparent loyalty to James II and celebrating William's victory while acknowledging the Anglican doctrine of passive obedience, which forbids political opposition to the rightful hereditary monarch. The work was influential enough to give the Irish Anglican hierarchy sufficient time to reestablish itself in Dublin. *The State of the Protestants* was also a distinctly Irish tract, laying a foundation for such seminal works as William Molyneux's *Case of Ireland* (1698) that would lead to increasingly well-defined philosophical espousals of rights of national identity and significantly influence the thinkers of the American Revolution.

King became active in all aspects of Irish intellectual and spiritual life. He produced two seminal works of Anglican theology, the 1709 sermon *Divine Predestination and Foreknowledge* and, more importantly, his 1702 *De Origine Mali* (*Essay on the Origin of Evil*). *De Origine* stimulated a spirited argument among intellectuals across Europe. (Pierre Bayle identified weaknesses in King's thought, while Gottfried Leibniz led a defense of the basic tenets of the work.) King was also one of the primary forces behind the reinvigoration of the course of study of Trinity College Dublin, supported efforts to translate the Bible into Irish, and attempted to oversee the creation of charity

schools to spread Anglican education (which he envisioned as engaging the liberal Enlightenment worldview). Politically, King's life was perhaps more one of failure than success; spiritually and intellectually, his contribution to Irish, British, and West European thought is still very much underappreciated.

Universities and Intellectual Centers in Colonial North America

Less than two decades after the *Mayflower's* arrival in the New World, Puritan émigrés from England in 1636 established the British colonies' first university, Harvard. It was the third university to be established in the Americas, as both the University of San Marcos in Lima, Peru, and the Royal and Pontifical University of Mexico were chartered in 1551 by royal decree. By the eighteenth century more colleges had been established, including the College of William and Mary (1693), King William's Secondary School (later St. John's College, 1696), Yale (1701), Princeton (1746), Queen's College (later Rutgers University, 1766), Dartmouth (1771), and Royal and Literary University of Guadalajara (1791). Elites were also trained in secondary schools, the first of which was the Boston Latin School (1635). Schools were also founded for Native Americans largely with an eye to spreading Christianity, including Harvard's brief seventeenth-century experiment, the Indian College, that boasted only one graduate. Dartmouth College also had its origins as a "charity school" for Native Americans in the mid-eighteenth century.

The main goal of these early institutions was to educate and train ministers. The seventeenth-century curriculum at Harvard resembled that

► THE ROYAL AND PONTIFICAL UNIVERSITY OF MEXICO

New Spain's religious leaders first proposed a university in 1536 that would offer both training for clergy and secular learning. In 1551 Charles V's royal decree created both the Royal and Pontifical University of Mexico and the University of San Marcos in Lima, Peru. These decrees were followed by papal bulls that officially established the institutions several years later. Both were modeled on the University of Salamanca, Spain's oldest university, founded in 1254, which like its New World counterparts had financial support from both the Crown and the Vatican. Subject areas taught included the traditional arts of theology, canon law, civil law, and humanities. Soon after, medicine was added to both universities. The library had 10,000 volumes and was open to the public. At the Royal and Pontifical University of Mexico, the Chair of Medicine was established in 1578, a Chair of Vespers (an early evening lecture) was established in 1599, the Chair of Surgery and Anatomy was established

in 1621, and in 1637 a Chair of Astrology and Mathematics was established. Much of the education relied on the scholastic model that followed the traditions of Aristotle and Saint Thomas Aquinas. Professors offered lectures followed by a disputation or a debate. Not all learning was confined to lecture halls. As of 1645, medical students in Mexico City were required to attend dissections held every four months at the Royal Hospital for Indians. Royal decree required that universities also include the studies of indigenous languages, and chairs for the study of Nahuatl and Otomi were established in 1627. The rector of the college in Mexico (as in Salamanca) could judge crimes committed on the campus. The rector, however, was not allowed to impose harsh punishment such as mutilations or executions. As in Salamanca the university in Mexico had a dungeon, though it is said that the dungeon was rarely used.

—Fred Nadis

of medieval universities in Europe. Both Harvard and the University of Mexico lagged behind European developments in thought and science. The main subjects were philosophy, with an Aristotelian approach; the study of "learned" languages, such as Hebrew, Latin, and Greek; and belles lettres. Logic, ethics, geometry (algebra was not added to the curriculum until 1721), and astronomy were also objects of study. There was an effort to focus each day on one topic, or disputation, as in medieval universities. Charles Morton, versed in European scientific thought, came from England to Harvard as a fellow and vice president in 1686. Written in part in rhymed couplets, Morton's *Compendium Physicae* was adopted at Harvard and remained the primary science text in the colonies until 40 years later, when Isaac Greenwood took the Hollis Chair of Natural Philosophy at Harvard and his text *Newtonian Experimental Course on Mechanical Philosophy* became the standard.

Cultivation of the sciences was welcome in Puritan circles. Natural theology encouraged the study of nature as a way of appreciating divine handiwork. Books such as John Ray's *The Wisdom of God Manifested in the Works*

of Creation (1691) were popular in private libraries. Educated in Europe, John Winthrop Jr. (1605–1676), son of the first governor of the Massachusetts Bay Colony, pursued interests in alchemy, chemistry, astronomy, and medicine; he set up the colony's first ironworks, acted as a physician, and after the founding of the Royal Society of London for Improving of Natural Knowledge in 1660 became the first colonist to become a fellow. Harvard's early graduates included the clergyman, colonial leader, and later Harvard president Increase Mather (1639–1723) and his son Cotton Mather (1663–1728), a polymath who entered the university at age 11. In addition to his duties as a minister, Cotton Mather, a fellow of the Royal Society, wrote numerous books on subjects ranging from theology to history and had interests in natural history, agriculture, and medicine. He was a central figure in the controversial introduction of smallpox inoculations, an indigenous practice in western Africa, to the colonies.

While the university system in colonial New England helped produce keen minds including Thomas Jefferson and James Madison, both of whom were educated at William and Mary, scientific and technical knowledge required other

routes of diffusion. Following the formation of the Royal Society in Britain, there were several efforts to set up a similar society in the colonies. The idea was first proposed by Increase Mather, and half a century later the botanist and botanical collector John Bartram made a similar proposal. After first promoting Bartram's idea, Benjamin Franklin (1706–1790) succeeded in establishing the first such institution: the American Philosophical Society. In 1743 Franklin circulated his pamphlet *Proposal for Promoting Useful Knowledge among the British Plantations in America*. The pamphlet urged "That one Society be formed of Virtuosi or ingenious Men residing in the several Colonies, to be called The American Philosophical Society." The group would always have as standing members "a Physician, a Botanist, a Mathematician, a Chemist, a Mechanician, a Geographer, and a general Natural Philosopher, besides a President, Treasurer and Secretary." These members were to be charged with corresponding and disseminating knowledge to American Philosophical Society members. In addition to botany, the society would consider mining and minerals, medicine, chemistry, mathematics, stock breeding, and "philosophical experiments." The society formed, met, received acclaim from Europe, but soon after dissolved. It was revived 20 years later and has survived to the present.

One of the society's earliest publications (translated into several languages because of demand), *An Account of the New Invented Pennsylvania Fire-Places*, was an embellished sales pitch for the Franklin stove to benefit a friend of Franklin who was manufacturing the stoves, which Franklin had left unpatented. Franklin's reputation as a leading scientist was made in 1751 when Peter Collinson, president of the Royal Society, published Franklin's letters collected from 1747 to 1750 on electricity. When the disbanded American Philosophical Society was revived in 1767, it merged with several other groups to create an institution even more clearly modeled after the British Royal Society. Franklin was elected president of the new-formed society in 1769, an office he held until his death in 1790.

A second scientific society, the Virginia Society for the Promotion of Useful Knowledge, was founded in 1773.

American Philosophical Society members and associates included Franklin, physician Benjamin Rush, physician Thomas Bond, botanist John Bartram, mathematician and astronomer David Rittenhouse, ornithologist John James Audubon, and Thomas Jefferson. In 1794 Charles Willson Peale, the portrait artist, taxidermist, and exhibitor of natural wonders and technological innovations, moved his (and North America's) first museum to the American Philosophical Society headquarters, Philosophical Hall. Peale's supporters included George Washington and Thomas Jefferson.

Later institutions that promoted the "useful arts" in North America included numerous "mechanic's institutes," modeled after such societies in England and aimed at diffusing technical knowledge for mechanics, inventors, and industrialists. The first in the United States was the New York Mechanic and Scientific Institution (founded in 1822). A similar society, the Franklin Institute, was created in Philadelphia and named after Franklin; it is still in existence today.

■ Introduction: Cycles of Tolerance and Persecution

In the early modern period many societies were dealing with the question of religious toleration. Reasons for this include the Protestant Reformation, which by dividing the Latin Christian world made toleration between Christian communities a lively issue, and the global expansion of Christianity, which brought intolerant Christian regimes to many new areas of the world, and forced non-Christian governments such as those of China and Japan for the first time to confront Christian churches and decide what to do about them. The spread of the printing press also provided a way for religious ideas to propagate themselves in hostile societies. And the centralized states of Asia, the so-called Gunpowder Empires, were allied with specific religions and ideologies, from the Sunni Islam of the Ottoman empire to the Neo-Confucianism of Qing China, and each had to decide how religious communities not sharing the politically dominant ideology in their vast empires were to be treated.

Religious toleration was often complicated by the issue of loyalty to the state. Catholicism, with its international hierarchy and its identification with the rising empires of Portugal, Spain, and France, was particularly likely to be suspected as a stalking horse for subversion or conquest. In the late sixteenth century states as far apart as Hideyoshi's Japan and Elizabeth's England took measures against Catholic priests, fearing them as intelligence gatherers and organizers for Spanish conquest. In zones of intense religious conflict, like that between Catholic and Protestant states in Europe from the Reformation to the Treaty of Westphalia in 1648 or the confrontation between the Sunni Muslim Ottomans and Shia Muslim Persians, membership in the religious community of the enemy state could be viewed as inextricably associated with political disloyalty. The conflict between the rising Hindu Maratha state and the Muslim Mughals in early-eighteenth-century India also took on some aspects of a religious war. Areas where the majority of the population adhered to the "enemy" religion, as Catholic Irish people did in the Protestant British Isles, were particularly likely

to see harsh persecution for political rather than purely religious reasons.

The reasons for persecution, however, were not always structural or related to international politics. The personality of a ruler could have much to do with his or her treatment of religious minorities. Mughal India went from the tolerant ruler Akbar, interested in religious dialogue and syncretism, to the strongly intolerant Muslim Aurangzeb in a few generations. Louis XIV of France expelled the Huguenots, French Protestants, from his country in 1685 not for any threat they posed—indeed, they would pose more of a threat outside France than within it—but because of his desire for religious uniformity throughout his kingdom. Other minorities who posed no threat to the state or the dominant church were persecuted for their challenge to social norms, a classic example being the Quakers of late-seventeenth-century England and British America whose distinctive dress and manners isolated them from the mainstream.

Intolerance could be turned against minorities whom the persecuting authorities themselves defined, as in the witch-hunts that took place throughout Europe and European colonies in America. Witches were not a religious minority but were defined as followers of Satan, the archrival of the God of Christianity. The Catholic Inquisitions, perhaps the most effective persecutors of the early modern era, proved extraordinarily successful at ferreting out individual religious dissidents or heretics who were not affiliated with a rival church (although the Inquisitions were often skeptical of witchcraft charges).

Toleration too took many forms. Religious minorities had a recognized place in many traditional polities. Jewish and Christian minorities, although discriminated against in many ways, were generally allowed to govern themselves in traditional Islamic states. Jews, but usually not Muslims, were tolerated in some European states, although this permission could be revoked at any moment. (Jews and other religious minorities could also be subject to popular violence even when ostensibly protected by

a tolerant state.) Parts of the Christian world, traditionally the least tolerant of the major Eurasian civilizations, moved toward toleration partly as a result of exhaustion after bloody religious wars. This was a phenomenon far more marked in Protestant than in Catholic societies. By the late seventeenth century a few European writers were arguing for religious toleration as a positive good rather than a necessary evil. Although some radicals argued for “freedom of conscience” on theoretical grounds, others were influenced by the example of the Dutch Republic, which demonstrated the compatibility of Christendom’s most religiously tolerant regime with strong economic growth.

—William E. Burns

Sunni-Shia Conflict in West Asia

The schism between Sunni and Shia Muslims began shortly after the death of the Prophet Muhammad in 632 CE. The Prophet had not left a living son and had not designated a successor. Some followers believed that the successor, or caliph, should come from Muhammad’s clan, the Hashemites of Mecca. Others believed that the caliph should come from his tribe, the Quraish, that included the rival clan of Umayya. A minority believed that any Muslim could lead the community.

Arab tradition sanctioned passing leadership from father to son but did not mandate it. Succession was often decided by consensus of clan or tribal leaders. Consequently, the leaders of the *umma* (community) selected one

of Muhammad’s early converts, Abu Bakr, as the first caliph. Abu Bakr was a member of the Prophet’s tribe but was not closely related, although he was the father of Muhammad’s favorite wife, Aisha.

The Muslim community accepted Abu Bakr (632–634), but some believed that Ali, the Prophet’s nephew, son-in-law, and adopted son, should be caliph. They were the Shiat Ali (the Party of Ali). Ali accepted Abu Bakr’s leadership and that of his successor Umar (634–644) but was not enthusiastic about Uthman, the third caliph (644–656). Uthman was a Muslim convert from the Umayyads, a rival clan in the Quraish tribe.

After Uthman’s assassination in 656, Ali finally became caliph. The Umayyads suspected that Ali was behind the death of Uthman, and their head, Muawiyyah, challenged Ali but did not immediately mount a revolt. Muhammad’s widow, Aisha, also claimed leadership in the name of her father and her status as the Prophet’s favorite wife. Ali defeated Aisha in 656 at the Battle of the Camel and allowed her to retire to Medina while he operated from Kufa (in present-day Iraq).

Ali faced a more serious challenge in 657 when he replaced Uthman’s nephew, Muawiyyah, as governor of Damascus. Muawiyyah was also the son of Abu Sufyan, one of Muhammad’s most zealous opponents. The assassination of Uthman coupled with the rivalry between the Hashemites and the more wealthy Umayyads fed the dispute on succession. This erupted in a dispute that would split Islam for centuries.

Ali and Muawiyyah met in battle at Siffin (in present-day Syria) in 657. Facing defeat, Muawiyyah’s army raised copies of the Quran on their spears and declared that the Muslim Holy Book required disputes to be settled by Allah. The basis for this was Muhammad’s declaration that Allah’s community could not err. This meant arbitration. Muawiyyah returned to Damascus. Some disagreed and formed a dissenting movement known as the Kharijites, or seceders. They dispatched assassins against Ali and Muawiyyah. They succeeded in killing Ali in 661 but were not successful against Muawiyyah. The latter, who had added Egypt to his rule, then became the first Umayyad caliph, beginning a dynasty that lasted until 750.

Battle of Siffin between the followers of Muawiyyah and of Ali. A miniature painting from a nineteenth-century manuscript of Hamla-i Haydari, a poetical account of the life of Ali by Bazil. (The British Library)

Ali's eldest son Hasan from his marriage to Fatima accepted Muawiyyah as caliph. The Shiat Ali returned after his death in 680. The question of succession continued. Some called on Muhammad ibn Hanafiyyah, a son of Ali by a wife other than Fatima, to lead a revolt. He was reluctant, and after his defeat in 687 he was allowed to retire to Arabia. Others insisted on a descendant from Ali and Fatima, and Ali's second son by Fatima, Hussein, claimed the right to be caliph and raised an army to confront Yazid, Muawiyyah's son. The Shia army was defeated at Kerbala in 680, and Hussein died with his followers. This occurred on the tenth day of the Muslim month of Muharram, Ashura, which has since become an important date in the Shia calendar.

The Alids then split into factions who argued on how far the line of descent from Ali could claim leadership. Some interpretations ended at 5 successions, some at 7, and most at 12. The first still exist in Yemen as the Ibadites. Those advocating for seven Imams (or Seveners), are also known to history as the Assassins, concentrated in India. The majority are the Twelvers, who supported the notion of 12 generations of Imams, the last of which disappeared in 869 (but will one day reappear). This Shia doctrine predominated in the Persian Islamic regions but also remains strong in some Arab areas.

The Shia developed a messianic tradition in which the last imam would return at the end of time as the Mahdi to prepare the world for the final judgment. Sunni Islam developed a similar doctrine but did not attribute to the Mahdi the same powers as the Shia Mahdi. Both reflect the influence of earlier Christian, Jewish, and Zoroastrian religious thought regarding concepts such as life after death, a Messiah, and a Day of Judgment. Although fundamentalist theologians of all three faiths insist that their Holy Books are divinely inspired, unique, and unchangeable, most historians tend to emphasize the cross-cultural and religious influences of varying peoples on each other, as this suggests. It should be noted that the Quran addresses the issue in different Suras. Modern Muslims and others point out Suras that endorse acceptance of so-called Peoples of the Book as legitimate believers not to be disturbed by the advance of Islam. Others, however, point to Suras that denigrate Jews and

➤ KHARIJITES—THE FORGOTTEN SCHISM IN ISLAM

Many of Ali's supporters rose to his banner to restore the caliphate to the family and clan of Muhammad. Others, however, supported Ali in reaction to what they believed was the corruption of their faith by Uthman and his nepotism. The Kharijites opposed Ali's agreement to arbitration in 657 after the Battle of Siffin and insisted that only Allah could decide the dispute over succession to Muhammad. Of more importance was their belief that Islam should return to their puritanical vision of the religion espoused by Muhammad rather than succumb to the materialism they attributed to Uthman and the clansmen he had appointed to positions of power. After Siffin the Kharijites opposed both Ali and his competitors. Ali defeated a Kharijite army at Nahwaran in 658, but the survivors carried on the movement, assassinating Ali in 660 and continuing to revolt against the Umayyads. Their religious beliefs remained fundamentalist, but they abandoned the insistence on the leader of Islam coming from the line of Ali or even the Prophet's clan. The Kharijites required only a sincere belief in Islam as requisite for election as imam, including from non-Arab peoples. This attracted Persians and others who believed that they were second-class citizens in the Islamic world. The Kharijites continued to threaten Umayyad and the Abassid caliphs for centuries. Over time the more militant Kharijites gave way to moderation, coming to power in Uman and north-eastern Arabia as the modern Ibadites. Their trade across the Indian Ocean led them to prominence in Zanzibar and East Africa, with a following in some North African communities that persists.

—Daniel E. Spector

Christians. The fact that both positions can be supported by quotation of various Suras illustrates the fact that all Holy Books can be selectively used to support varying interpretations.

Syncretic Monotheism under Akbar the Great

Akbar's reign (1556–1605) as Mughal emperor was marked by many achievements. However, he is probably best remembered for the religious tolerance that he vigorously championed and personally exemplified. In this, his efforts took several forms. While some of his practical reforms and initiatives were bold, his philosophical project of developing syncretic religious ideals (attempting to integrate diverse religious beliefs and practices) generated admiration and controversy.

A person of irrepressible curiosity and intellectual courage, he built an Ibadat Khana (House of Worship) in 1575 in Fatehpur Sikri, a temporary capital of the Mughal empire. This city is located near Agra (the location of the Taj Mahal) and was completed in 1578. Akbar invited not only Muslim *ulema* (scholars) of both Sunni and Shia orientations but also Hindu *pundits*, Jain *sadhus*, Zoroastrian *mobeds*, Jesuit missionaries (e.g., Fathers Aquaviva and Monserrate), Buddhist monks, and Muslim Sufi mystics to discuss religious issues in an enlightened environment at his Ibadat Khana. He himself was an attentive listener and an engaged participant in these lively discussions. He began to be increasingly convinced that there were virtue and piety in all religions, and there was an underlying spiritual unity that transcended their differences. His notion of Din-i-Ilahi (Divine Faith) tried to capture that syncretic ideal.

It has been suggested that the Din-i-Ilahi was more a set of moral exhortations and an ethical system than a religion. It sought to restrain human failings such as lust, pride, slander, greed, and envy and inspire values of integrity, honor, altruism, gentleness, and tolerance. Specific religious/ritual requirements were minimal, and even the expectations that he had of the administrative leadership (e.g., the governors were supposed to keep night vigils and eat and sleep in moderation, practice meditation, celebrate birthdays by giving alms, etc.) were more suggestions than demands.

Incidentally, the emperor hardly ever referred to his teachings by any specific name, nor did he claim to be a prophet, introduce a priestly

hierarchy, initiate the writing of a new scripture, or encourage any proselytizing efforts. Indeed, the total number of adherents was probably less than 100 (by some accounts no more than approximately 20), and even many of his trusted advisors and friends did not convert. The phrase “Din-i-Ilahi” was coined after his death, and his own royal advisors often termed the ambiguous corpus of pronouncements on faith and practice as “regulations for guidance” or “rules for the royal disciples.”

Most Muslim scholars (the *ulema*) were either confused or angered by his efforts. First, there were some misunderstandings created in 1579 by the *mazhar* (a public edict, erroneously called the “Infallibility Decree”) in which the emperor was invested with powers to supersede the advice of Muslim theologians in matters both spiritual and temporal. This was probably a practical move on his part in the context of the squabbling *ulema*, and moreover, this was not unique in terms of Muslim paradigms of royal authority. However, in the context of Din-i-Ilahi introduced in 1581 and the grand titles that his disciples sometimes gave to him (e.g., “The Revealer of the Internal and the Depicter of the Real”), many Muslims assumed that Akbar was claiming some form of “Divine Kingship,” an idea that was anathema to orthodox Muslims.

Second, some of the rituals and practices he adopted also troubled many Muslims. Thus, his suggestion that a fire be left continuously burning in the court, his practice of meditating while he was facing the sun, his prohibition of the slaughter of animals on certain days, the official celebration of Nawroz (the Parsi New Year), his endorsement of some Shia doctrines, and his frequent visits to Sufi shrines were all considered by some mainstream Muslims as unacceptable deviations from the “straight path” of Islam. Indeed, Shaikh Ahmad Sirhindi, the preeminent Islamic scholar of the time and revered as the Mujaddid-i-Alfi-Thani (“The Renewer of the Second Millennium”), expressed concern, if not disdain, about some of the emperor's ecumenical compulsions.

It is unclear whether the emperor had actually left Islam in favor of his new creed. Some of his habits and indulgences were questionable from a Muslim perspective and would suggest that he had, indeed, abandoned the faith he

► RELIGIOUS TOLERANCE UNDER AKBAR THE GREAT

Akbar encouraged religious tolerance in various ways. First, he opened up the administration to include the most talented people in the country regardless of religious affiliation (almost 38 percent of higher military/administrative positions were held by Hindus). Second, while he was not the first Muslim emperor to marry non-Muslim women, he was certainly one of the first to allow them to pursue their own religious traditions, even in the royal household. And third, he took various policy initiatives to advance his message of *sul-hi-kul* ("peace with all").
